Liliums, Begonias, Dracaenas, and Ferns were well represented. Indeed, in regard to the cut flowers, generally speaking the display was magnificent. There were Dahlias (single, and double, and pompon), Gladioli, African and French Marigolds, Asters, Carnations, Phloxes, and Pansies. Herbaceous flowers were the best feature in this section. Hand bouquets come in for a large share of attention, and they comprised a very creditable display, the wild flowers of course being a feature.

In the competition confined to nurserymen Messrs. Cocker & Sons, Aberdeen, took the 1st honours for double Dahlias, single Dahlias, and Roses; while Messrs. Laird & Sons, Edinburgh, were 2d for Dahlias; and Messrs. D. & W. Coll, Dundee, 2d for Roses. The Edinburgh firm took the 1st place for table plants, Messrs. Cocker & Sons being 2d, and Messrs. W. Smith & Son, Aberdeen, 3d.

For Roses and single Dahlias, in the professional class, Mr. James Hunter, Richmond Hill, was 1st. For double Dahlias, Mr. James Wilson, Montrose, was 1st.

For pompons, Mr. A. Davidson, Aberdeen, was 1st. FRUIT.—In the section for fruit, the display of Grapes was the finest seen at any of the Society's shows for many years. For bunches of Grapes Mr. Stratton, gr. to Mr. Lumsden, of Edinacree, took the 1st prizes in the competition for three varieties and two varieties;

the 2d and 3d honours going to Mr. Andrew Reid, Dirris, and Mr. John Forrest, gr. to the East of Aberdeen, Haddo House.

Mr. Forrest was 1st for white Grapes; and he occupied a similar position in the competition for the best collection of fruit considered as a whole.

VEGETABLES.—The section for vegetables was by far the best in the show. There were no less than seven baskets of vegetables, and the person who gained a prize had to have something very special before he could secure the honour. Mr. George Ogg, gr. to Major Ramsay, of Birra, took the premier position for baskets of vegetables in the section open to gardeners only, and Messrs. George Milne, Cluny, and George Wilson, Montrose, were 2d and 3d respectively.

In the competition confined to market gardeners, Mr. William Henderson, Bloomfield, Aberdeen, was 1st; Mr. Davidson, Aberdeen, 2d; and Mr. John Yule, W. of Ince, 3d.

For Potatoes, which comprised the best display in the hall, Mr. Gidger, Sunnybank, carried the chief honours, obtaining the Society's Silver Cup.

DECORATIONS.—The table arranged by Messrs Cocker & Sons contained a collection of Carnations and Picotees, in which were over 150 blooms, including all the finest varieties in cultivation. Their Roses were a special feature, made up in bunches of all the leading varieties, including among those which were readily caught the eye, those of Marie Van Houtte, Grae Darling, Madame de Uteville, and Madame Lambert. The H.P.'s were also represented, but one had only to look at the 1st prize stand to realise the excellence of the collection.

Conspicuous amongst the herbaceous plants were the three varieties of the Iceland Poppy, white, orange, and yellow, which are very popular.

Messrs. Smith & Sons, of Aberdeen and Kintore, exhibited neat and select collections of stove and greenhouse plants, Ferns, Gladioli, hardy herbaceous flowers, &c. The Gladioli were of the seedling and named hybrid varieties, and included some very fine new flowers. The speciality of this firm's exhibit, however, was their rare and extensive collection of hardy herbaceous flowers, a class of flowers rapidly growing in popularity, and replacing the erstwhile bedding plants.

Messrs. Ben Reid & Co., of Aberdeen, also showed a capital collection of stove and greenhouse plants, including *Amansia sativa variegata*, a very handsome specimen, a few good pots of *Lilium*, *Pelargonium*, *Croton*, *Pala*, *Dracena*, *Pandanus*, *Ferns*, *Coleus*, *Aralias*, *Caladiums*, &c.

Messrs. Dobie & Company, Rothsay, sent a beautiful collection of flowers for exhibition.

DUNDEE SHOW: September 2.

A large marquee and two tents were erected on the Magdalen Green for the accommodation of the exhibits, which were in excess of last year, numbering 1704. For plants there were 207 entries, cut flowers 500, fruit 267, and vegetables 620, in addition to 110 entries in the honey department.

The central marquee, 300 feet in length by 45 feet in breadth, was devoted to pot plants and flowers. The tent on the East of it was occupied with fruit, honey, and flowers, while the one on the West was set apart for vegetables. The display of tree Ferns, Palms, and large foliage plants presented quite an impressive appearance.

The foremost group of pot plants were the four pots of summer flowering Chrysanthemums, for which Mr. William Kennedy, gr. to Provost Ballingall, gained the 1st prize. These remarkable plants have excited the admiration of nurserymen, gardeners, and amateurs. They were not only large, but firm and shapely in form, and of decided colouring, throwing the other competitors far in the shade.

Mr. Kennedy also showed six cut white Chrysanthemums at the left hand side of the entrance to the east marquee. They measured from 14 to 16 inches in circumference, and the breadth, fineness, and substance of the petals were specially noteworthy.

In Mr. George Davidson's prize lot of *Lilium auratum* the stems were from 5 to 7 feet high, and showed about 100 full-sized, rich-coloured flowers in excellent condition.

TABLES.

To gardeners and owners of conservatories the most conspicuous feature of the show was the competition between two remarkable prizetakers for the best table, 18 feet long by 3 of stove and greenhouse plants, for effect. The 1st prize went to Mr. Peter M'Arthur, gr. to Mr. John Leng, Kinbrae, and the 2d to Mr. William Allison, gr. to Mr. W. F. Low, Seaview.

There were no less than seventy beautiful Crotons on the two tables. Mr. Allison showed rare and valuable specimens of *Lycite Siamensis* and *Saccolabium Blumei* in pots. He also carried off the 1st prize in the interesting contest for the £4 and £2 10s. prizes for nine stove plants; Mr. Peter Marshall, gr. to Provost Robertson, Balmore, another worthy prize-

taker, came in 2d. Both groups of plants were admirable specimens. Conspicuous among Mr. Allison's were *Cycas revoluta*, *Stephanotis floribunda*, and *Croton Andraeanus*, *interruptus*, and *Queen Victoria*. Mr. Marshall among his nine showed *Pharum variegatum*, *Coprosma Dueriana*, and a remarkably fine *Stactis purpurea*, and perhaps the largest *Cycas revoluta* in the show. The competitors for the six prizes for six stove and greenhouse plants were also much admired.

The Fuchsias were not many in number, but exceedingly graceful in habit and beautiful in flower. Mr. Hector J. Watts, gr. to the Misses Thow, Craigmace, who gained the 1st prize for three, had splendid specimens.

In flat and quilled Asters the competition was extensive and keen, as all the flowers were in fine form and condition.

Miss Pitcaithly, Elcho Cottage, Perth, showed, in her prize twelve herbaceous flowers from the open border, a very beautiful array, deserving attention.

The single Dahlias have grown greatly in favour, and the nine bunches, for which Mr. James Hunter, gr. to Mr. John Lyall Grant, Richmond Hill, Aberdeen, gained 1st prize, were specially noticeable by the taste displayed in their arrangement.

The Dundee shows are never complete without Messrs. James Cocker & Sons' Roses. As usual these enterprising Aberdonians were in the front with exquisite examples of their favourite flower. Among their numerous exhibits were a number of new Tea Roses. Messrs. Cocker were also 1st in double Dahlias.

Messrs. John Stewart & Sons, nurserymen and seedsmen, Dundee and Broughty Ferry, exhibited a fine collection of ornamental Conifers, which are arranged in a group adjoining the Committee's tent. Among the best specimens of the collection are *Abies or Picea concolor*, a silver Fir from the Rocky Mountains, with leaves of a striking glaucous hue; *Thuja occidentalis lutea*, a golden-leaved variety of the Scotch American Arbor-vitae, which is likely to become a general favourite, owing to its extreme hardiness; *Juniperus sinensis aurea*, a fine specimen of the golden variety of the Chinese Juniper, a plant which seems to thrive in very exposed situations in Scotland; *Prunopsis elegans*, a Yew-like plant, with bright green foliage, a native of the mountainous districts of Chili, but which has proved itself hardy only in the most favoured situations in this country; and a number of *Elwanger's* or the *Tom Tumb* Arbor-vitae, of dwarf habit and eathery appearance. The group is edged by little plants of the Japanese golden *Kotinospora*.

Messrs. W. P. Laird & Sinclair showed a magnificent collection of stove and greenhouse plants, exotic Ferns, double, single, and pompon Dahlias, bedding Violets, &c. For the competition tables the firm stands alone, and to their credit had staged a rich collection of plants which for wealth of colour, diversity of foliage, and tasteful arrangement attracted considerable attention. In the centre of their table was placed a magnificent specimen of *Dracena Lindenii*, a variety of recent introduction, and whose graceful foliage rendered it peculiarly adapted for the position. It was well supported by superb specimens of *Croton Cheloni*, *C. volutus*, *C. Williamsi*, and *C. Lady Zealand*, the bright golden foliage of which presented a pleasing contrast with the dark red colour of the *Dracaenas*, several of which, such as *D. Mrs. Freake*, *D. nigrescens*, &c., are well worthy of notice. Among the more prominent plants were fine specimens of that graceful of all Palms, *Gonoma gracilis*, *Maranta Verchii*, *Dieffenbachia Buerii*, *Athyrium ornatum*, and *Alcetta Sanderiana*, the latter of which is a charming variety of recent introduction. The ground work of this table was composed of small Palms, Ferns in great variety, and the graceful hanging mosses lent a pleasing effect to the whole. They also staged a large collection of plants for exhibition, including fine flowering Crotons, *Dracaenas*, Palms, &c. For twelve exotic Ferns they again gained the premier position with beautifully grown specimens of *Aliantums*, &c. The twelve plants for table decoration brought forward a large number of entries, and with perfect specimens of *Crotons*, *Aralias*, *Dracaenas*, and Palms, this firm deservedly were placed 1st.

The Messrs. Coll had, as usual, exhibited largely, and took several prizes. Their 1st prize Gladioli were very fine, among them were *Anna*, *Shakespeare*, and *Thalia*. Their Roses, of which they make a speciality, were numerous; most noticeable among them were *Charles Lefebvre*, *Gloire de Dijon*, *La France*, *Alfred Colomb*, *A. K. Williams*, and *Prince of Wales*.

OXFORD MILLS FLOWER SHOW.

The yearly floral and horticultural show of the Oxford Gardeners' Society, Ashton, was opened on Saturday afternoon by Mr. Bruce Findlay, of the Royal Horticultural Gardens. The flowers entered for competition were unusually good, some of the specimens of Stocks being very large and compact—

in fact, the best ever exhibited at the show. There were also some very fine Gladioli and Liliums. The fruit generally was excellent, the Ficus particularly so; and some of the vegetables were worthy of commendation, especially the Cauliflowers.

Mr. R. France, of Crowthorn Nursery, as in former years, had a large collection on view. His show of Roses was very good. There were two-and-a-half dozen blooms in a box, all of them labelled and named for the benefit of those who desired such information. He also showed fine examples of Marigolds, Dahlias, Asters, Antirrhinums, Zinnias, Ferns, Balsams, Fuchsias, Begonias, Coleuses, Pelargoniums, &c. The collection of plants, &c., was the whole forming a very interesting exhibition, and one particularly creditable to local skill and perseverance in overcoming so well the drawbacks of a sterile soil, damp climate, and smoky atmosphere as to be able to bring forth results fairly to be put in competition, in some cases, with the produce of more favoured localities.

Mr. G. R. Garner, florist, of Bakewell, exhibited an admirable collection of flowers tastefully arranged in moss on a sandbed.

The Phloxes elicited admiration as magnificent specimens, and it was noticeable as a whole that the flowers were much larger than the corresponding ones usually seen in this locality. The Asters and Roses and single Dahlias were particularly noticeable for their large dimensions.

THE OPENING CEREMONY.

Mr. Bruce Findlay said he had been asked by Mr. Rupert Mason to appear there to say a few words on the subject of cottage gardening and the allotment system. Cottage gardening shows were increasing and multiplying throughout the land. Touching cottage gardening and allotments, he gave a lecture seven or eight years ago in Manchester, in which he said:—

"Whatever relates to the improvement of the soil and its profitable appropriation is of the highest importance. It is well known that the agricultural labourers of this country have not the same interest in the soil as they once had. Every village and district of the country readily affords examples of patches of land having been consolidated with a larger tract belonging to some wealthy person in the neighbourhood. Though this is a necessary consequence of the improved state of agriculture, the decay of the cottar tenantry is an evil which has been always insufficiently appreciated. There can be no doubt whatever that where practicable it is consistent with sound policy to let the English labourer have a share of the land. Various schemes have been propounded, having for their object the improving the condition of the agricultural labourer, many of which seem to be incompatible with his capacities. Out of this element he is timid and helpless, but in it all his powers seem to be gratified. The desire he evinces to become possessed of a patch of land to cultivate on his own account is little short of a passion, and it seems scarcely so long an apprenticeship. Inconsiderate friends, on the other hand, in talking and writing about it have pronounced it to be the realisation, in a great measure, of the state of perfect existence which poets have sighed for, and that which will sooner or later possess the whole land, but poets, as a rule, are but ill qualified judges of what is practically beneficial, and in the allotment system there is no poetry except that which springs from hard work. If anything will "possess the land" it is hard work. The allotment system itself would throw out thousands as unworthy to touch the soil which has appropriated to its most useful purposes. This subject has occupied the attention of almost every writer on rural economy, but the benefits to be derived will not fully appear in any case where spate husbandry is not strictly carried out and the greatest cleanliness maintained.

It is to be hoped that some intelligent farmers will take the hint thrown out by Mr. Gladstone, for there can be no doubt that the very implements in use under the allotment system leave the plough at an immeasurable distance in the background. Ireland has been often mentioned as a country of cottage allotments, and it has been asked is there anything there to induce its adoption elsewhere. Ireland may have its allotments, but certainly they are not cultivated, and so long as it remains a theatre of tumult and disorder, how can the arts of peace be prosecuted to a degree to give us any indication of what is really good or bad in the undertaking? It is scarcely fair, therefore, to form any opinion of the allotment system from the picture presented to us by Ireland. Besides which, it is notorious that, the great proportion of the labouring classes in that country prefer idle, reckless, and exciting scenes, to the cultivation of their crops. Against a cautious people allotments will do great things, but they will not save the idler from the disgraceful situation which awaits him in society."

NATIONAL CHRYSANTHEMUM.

An exhibition of early Chrysanthemums, with Dahlias, Gladioli, &c., was held at the Westminster Aquarium on September 9 and 10, when the following prizes were awarded:—

POLICE WINNERS.				
Class.	Exhibits.	First.	Second.	Third.
<i>Chrysanthemums.</i>				
1	Group of early-flowering Chrysanthemums, arranged in a vase, exceeding 60 square feet, quality and general effect to be the leading feature	Mr. N. Davis, Camberwell Temple	Mr. J. Wright, Middle Temple	Mr. G. Stevens, Putney
2	Group of early-flowering Chrysanthemums arranged in a space not exceeding 40 square feet, equal by any general effect to be the leading feature (on a ryma excluded)
3	Collection of forty-eight plants as grows for market	Mr. W. Holme, Hackney
4	6 plants (untrained) of Madame C. Desgrange	Mr. Wright, Middle Temple	Mr. Stevens, Putney
5	6 plants (untrained) any varieties except Madame C. Desgrange
<i>Cut Flowers.</i>				
6	Collection of cut Chrysanthemums (any Mr. Stevens, Putney .. Mr. Davis, Camberwell	Mr. W. Piercy, Forest Hill
7	12 blooms, Madame C. Desgrange .. Mr. Wright, Middle Temple	Mr. T. Sadler, Stratfield
8	12 Blooms, any varieties except Madame C. Desgrange	Mr. Sadler, Stratfield ..	Mr. Davis, Camberwell
9	12 Pompons (hybrids allowed), three flowers of each, to be shown with foliage	Mr. Davis, Camberwell ..	Mr. W. Holme, Hackney
10	6 Bunches, Madame C. Desgrange, three blooms in each, with foliage
11	6 Bunches, any varieties except Madame C. Desgrange, three blooms in each, with foliage	Mr. G. Bolas, Wickworth

The following prizes were offered by the Royal Aquarium Company:—

POLICE WINNERS.				
Class.	Exhibits.	First.	Second.	Third.
<i>Gladioli.</i>				
12	Collection of Gladioli 4 s. d. 3 0 0 2 0 0	Messrs. Barrell & Co., Camberwell
13	12 Gladioli spikes 1 0 0 0 10 0 0 5 0	Rev. H. H. D'Oubrai, Ashford, Kent
<i>Dahlias.</i>				
14	48 blooms (show or fancy), not less than twenty-four varieties, or more than two blooms of one variety	4 0 0 3 0 0 2 0 0	Messrs. Keynes, Wilmslow & Co., Salisbury
15	24 blooms, show varieties, distinct	1 0 0 2 0 0 1 0 0	Mr. Turner, Slough
16	24 blooms, fancy varieties, distinct	1 0 0 2 0 0 1 0 0	Messrs. Keynes, Wilmslow & Co., Salisbury
17	24 bunches, pompon varieties, distinct	2 0 0 1 10 0 1 0 0	Messrs. J. Cheal & Mr. Turner, Slough
18	24 bunches, single varieties, distinct	2 0 0 1 10 0 1 0 0	Ditto Ditto
19	12 blooms, show varieties, distinct	1 0 0 0 15 0 0 10 0	Mr. Glascock, Bishopstoke, Hants
20	12 blooms, fancy varieties, distinct	1 0 0 0 15 0 0 10 0	Ditto Ditto
21	12 bunches, pompon varieties, distinct	1 0 0 0 15 0 0 10 0	Mr. J. T. West, Brentwood
22	12 bunches, single varieties, distinct	1 0 0 0 15 0 0 10 0	Mr. T. W. Girdlestone, Berks

JUDGES.

Dahlias, Gladioli, &c.—Messrs. R. Dean, G. Gordon, and Swift. Chrysanthemums:—Messrs. Gilbey, Gibson, and Kendall. Honorary Secretary:—Mr. William Holmes, Frampton Park Nurseries, Hackney.

BATH FLORAL FETE: AUTUMN SHOW: September 1 and 2.

As is usual the exhibits were distributed through several tents; but a reform is urgently needed in three particulars:—first, the tents are far too dark, and on a dull day it is difficult for the judges to properly inspect the exhibits; if only white duck could be used instead of the dark heavy material now used for tents, the effect would be so great that Committee, exhibitors, and judges would rejoice in common. Year by year the trees in the Sydney Gardens grow taller and thicker, hence the necessity for tents admitting all the light possible. Secondly, the clumsy wooden stages composed of rough deal slabs should be abolished, and replaced by neat trestles and tables, not so tall, and covered with green baize. And the green baize should be wide enough to fall down in front of the tables, and hide from view the motley collection of boxes, baskets, &c., that peep out beneath. This roughness is characteristic of West of England shows generally. Thirdly,

were many of the plants instead of being placed upon rough deal staging far too high, in not a few instances, to see little else but the pots, placed on the turf they would show to much better advantage. One more vicious practice might be mentioned, that of both taking fresh, and altering old entries on the morning

of the show day. It leads to a great deal of confusion, and it causes a vexatious delay.

FUCHSIAS.

Fuchsias have the foremost place in the schedule of prizes, and here they were presented in that character for which the district is famous. Mr. J. Lye, gr. to the Hon. Mrs. Hay, Cliffe Hall, Market Lavington, was 1st with nine remarkable specimens, grown and flowered in his usual excellent style, the varieties being, Dod's Favourite, Thomas King, Henry Brook, Benjamin Pearson, Final, and Floribunda; dark varieties; Lye's Favourite, Emily Bright and Pink Perfection, light spots; 2d, Mr. George Tucker, gr. to Major W. P. Clark, Trowbridge, with only just inferior plants of Charming, very fine; Dod's Favourite, Beautiful, dark; and Mrs. Lucy Timms, double white corolla, as his best plants. 3d, Mr. E. Snell, gr. to Mr. Counsel, Bath.

Mr. J. Ruddle, gr. to Mr. Pinder, Bath, was 1st with six plants, staging excellent specimens; Mr. A. W. Southam, gr. to F. J. Walker, Esq., Bath, being 2d.

The best four were shown by Mr. Thomas Jolly, gr. to A. Hawkins, Esq., Bath, a very good lot. There were classes also for single specimens, light and dark variety.

STONE AND GREENHOUSE PLANTS.

Mr. James Cypher, of Cheltenham, scored another

victory, being an easy 1st with twelve plants in bloom, his best being *Lapageria alba*, *Ixora Duffii*, his huge *Phenocoma*, *Allamanda nobilis*, *Ixora Regina*, and *Erica Altonii* Turnbull; 2d, Mr. W. Louley, gr. to C. Gardner, Esq.; and 3d, Mr. F. Mould, nurseryman, Pewsey.

Mr. Tucker had the best six plants, staging nice fresh well-grown and flowered examples of *Bougainvillea glabra*, *Lapageria rosea*, *Stephanandra floribunda*, *Anthurium Scherzerianum*, *Allamanda Hendersoni*, and *Rondeletia speciosa* major; 2d, Mr. W. J. Mould, gr. to E. E. Bryant, Esq., with *Allamanda Hendersoni*, *A. nobilis*, *Ixora amabilis*, *Erica Weriana*, &c.

In the classes for a single specimen stove, and also of greenhouse plant, Mr. J. Cypher was 1st.

Mr. J. W. Mould had the best new or rare plant, staging *Anthurium Veitchii*; Mr. J. Mould being 2d, with *Croton Bergamoni*. Mr. J. Cypher had the best six *Heaths*, the specimens small; and Mr. J. F. Mould was 2d.

Mr. W. J. Mould had the best three; Mr. W. C. Drummond, nurseryman, Bath, being 2d. There was also a class for a single specimen. Mr. J. Cypher was 1st with six *Orchids*, showing nice examples of *Cattleya Gaskelliana*, *C. Dowiana*, *C. speciosissima*, *Odontoglossum flrande*, *Dendrobium bigibbum*, and *Saccolabium Blumei*; 2d, Messrs. Heath & Son, nurserymen, Cheltenham; and 3d, Mr. T. W. Fisher, gr. to K. B. Cator, Esq., Bath.

MISCELLANEOUS FLOWERING PLANTS.

Foremost among these must be placed the bedding *Pelargoniums*. The best six specimens—the best grown and flowered plants we have seen this season—came from Mr. Tucker, the varieties were Mrs. J. Gibson, Evening Star, President, Mrs. Strutt, Lizzie Brooks, and F. Atkins; 2d, Mr. G. Ruddick.

Variegated varieties were also shown in sixes: Mr. J. Lye had six excellent plants in the class from which tricolors were excluded.

Balsams were represented by sturdy well flowered specimens. *Verbenas* were good, *Petunias* also; there were a few good *Achimenes*, *Cockscombs* were very fine. Mr. A. A. Walters, nurseryman, Bath, had the best three *Liliums*; Messrs. G. Cooling & Son, Bath, being 2d. Mr. Cypher had the best specimen *L. auratum*; and J. Cypher being 2d.

Tuber-rooted *Begonias* were a very fine feature, the Rev. Canon Bernard had the best six, including *Snowflake*, a very fine white; Mr. W. Gurgill, gr. to W. Clifford, Esq., being 2d; and Mr. J. Dinneen, gr. to Solomon Tredwell, Bath, 3d.

FINE-FOLIAGED PLANTS, &c.

The best twelve came from Mr. J. Cypher, as usual, a fine lot; Mr. J. F. Mould being 2d. Mr. W. C. Drummond had the best six; Mr. G. W. Dobson, being 2d. Mr. Cypher had the best single specimen; Mr. Drummond coming in 2d. Mr. J. Lye was placed 1st, with six capital specimens of *Coleus*, well grown and the leaves finely coloured.

Ferns were shown in collections of fifteen and nine. With the larger number Mr. J. Coke, gr. to A. F. Stancombe, Esq., Trowbridge, was 1st with a medium-sized, fresh and very even lot; Mr. W. J. Mould being 2d; and Mr. Tucker, 3d. In the class for nine plants, Mr. Thomas Tinkle, gr. to The Carr, Esq., Bath, was 1st, with a very good lot, having *Davallia Mooreana*, *D. canariensis*, and *D. Tyermani*, *Gymnogramma Martensi*, *Asplenium exelsum*, *Adiantum cuneatum*, *A. gracillimum*, &c.; 2d, Mr. W. C. Drummond, Bath. British Ferns were also shown in collections of fifteen.

CUT FLOWERS.

A very fine collection of thirty-six spikes of *Gladioli* came from Mr. S. Bird, gr. to S. Dobree, Esq., Wellington, showing the best style; Mr. G. S. Walters, Chippenham, being 2d. Mr. James Tove had the best twelve spikes; Mr. S. Tottle being 2d. *Dahlias* were numerous and finely shown. Messrs. Keynes, Williams & Co., Salisbury, were 1st with twenty-four blooms, the leading blooms being *Colonist*, *Harry Keith*, Mrs. Langtry, Vice-President, *Constance*, *Henry Bond*, *William Rawlings*, *Miss Cannell*, *Mrs. Gladstone*, *Mrs. Shirley Hibberd*, *Lord Chelmsford*, *John Wpat*, &c.; 2d, Mr. G. Humphries, Fines, Chippenham.

Mr. Henry Bush, Bath, had the best twelve; Mr. Humphries being 2d.

Messrs. Keynes & Co. had the best nine fancy varieties, staging excellent blooms of *Gaiety*, *Rebecca*, *Pelican*, *Fanny Sturt*, *Henry Glascock*, *Rev. J. B. McCam*, *General Gordon*, *Salamander*, and a seedling; 2d, Mr. G. Humphries.

Messrs. Keynes & Co. also had the best twelve bunches of single *Dahlias*, Mr. A. A. Walters being 2d, and M. T. Tinkle 3d.

Roses were well shown also. Mr. J. Mattock, nurseryman, Oxford, had the best twenty-four, three of each, the following being especially noticeable—*Souvenir d'Elise Vardon*, *Madame H. Jamin*, *Perle des Jardins*, *Souvenir de Paul Neron*, *Marie van*

Houtte, *Jean Pernet*, &c.; 2d, Mr. G. Campbell, gr. to J. P. Budd, Esq., Bath; Mr. W. Smith had the best twelve, three blooms of each, Mr. W. Narroway, Oxford, being 2d; Mr. Smith was also 1st with twelve single blooms; Mr. S. P. Budd being 2d.

Mr. A. Hawkins was 1st, with twelve varieties of *Verbenas*, six trusses in a bunch, staging a very good lot; Messrs. Geo. Cooling & Son being 2d. The last named had the best twelve bunches of zonal *Pelargoniums*, staging a very fine lot indeed; Mr. J. Mattock being 2d.

Asters, both French and German, were very fine indeed, and very numerous. The best twenty-four blooms of German Asters came from Mr. W. J. Jones, gr. to J. S. Pope, Esq., Bath; Mr. A. A. Walters being 2d. Mr. Evry had the best twenty-four French Asters; Mr. W. J. Jones being 2d.

Phloxes, in spikes, in twelve varieties, were well shown by Messrs. W. Luton & J. Mattock.

The best twenty-four bunches of cut flowers came from Messrs. Heath & Co., Cheltenham, but they risked the chance of disqualification by putting up four or five varieties of *Gloxinias* in a bunch, the exhibit being restricted to twenty-four varieties; Mr. W. C. Drummond was 2d, but with a much less valuable collection.

TABLE DECORATIONS, BOUQUETS, &c.

Mr. J. Cypher had the best centre-piece for a dinner-table; Mr. W. Dobson being 2d. These were done in the best taste, and the same exhibitors were also 1st and 2d with a hand bouquet. Bouquets of wild flowers were also largely and admirably shown; and *epergnes* of the same also; also collection of twenty-four bunches.

FRUIT.

It was said to have been one of the finest exhibitions ever seen in Bath for some time. The best collection of eight dishes came from Mr. Nash, gr. to the Duke of Beaufort, Badminton, who had a very good lot, consisting of *Alicante* and *Muscata* of *Alexandria* Grapes, *Bellegarde* Peaches, *Nectarine Victoria* (P), Apples, Figs, *Washington Plum* and *Melon*. 2d, Mr. Pratt, gr. to the Marquis of Bath, Longleat, with fine *Black Hamburg*, and *Muscata* of *Alexandria* Grapes and Figs. 3d, Mr. A. Miller, gr. to W. H. Long, Esq., M.P., Rood, Ashton. Mr. Miller was the only exhibitor of a *Pine*, and was placed 1st with a good *Queen*.

The class for eight bunches of Grapes resulted in a close tussle between Mr. Taylor, formerly of Longleat, and now gr. to Mr. Alderman Chaffin, Bath, and Mr. Pratt; the former was placed 1st with fine and well finished examples of *Gros Maroc*, *Alicante*, *Alouwick* seedling and well finished *Muscata* of *Alexandria*; Mr. Pratt had the fine *Black Hamburg*, *Alicante*, and *Muscata* of *Alexandria*, for which he is so famous, the former was remarkably fine, and Mrs. Peice's *Muscata* his weakest pair.

Mr. Marchant, gr. to Jerom Murch, Esq., Bath, had the best three bunches of *Black Hamburg*, beating Mr. Pratt, who was 2d.

Mr. Pratt was 1st with three excellent bunches of *Muscata* of *Alexandria*; Mr. J. Elliott, gr. to H. W. Tugwell, Esq., Bath, being 2d. Mr. J. Milton, gr. to J. Macpherson, Esq., was the only exhibitor of *Gros Colmar*, showing rather indifferent bunches. Mr. A. Young, gr. to B. Thomas, Esq., was 1st with two bunches of another white, having *Butterland Sweetwater*; Mr. Iggluden, gr. to the Earl of Cork, Marston House, Frome, being 2d with the same. In the class for any other black, Mr. Nash was 1st with *Alicante*, Mr. E. G. Peacock being 2d with the same. *Melons* were very plentiful. Mr. Iggluden had the best dish of nine *Peaches*, showing capital *Barrington*; Mr. Pym, gr. to Mrs. Goldsworth, Trowbridge, being 2d with *Exquisite*. Mr. J. Derham was 1st with a dish of six, having the fruit of *Forde's Seedling*; Mr. H. Lewis, gr. to B. Castle, Esq., being 2d with *Royal George*; Mr. J. Murch had the best nine *Nectarines*, staging *Victoria*; Mr. G. Pym being 2d with *Pine-apple*.

Nectarines, in dishes of six, were poorly shown. *Plums*, *Figs*, *Cherries*, *Filberts*, *Pears*, and *Apples*, were all very good, and in great numbers.

VEGETABLES.

Vegetables were in strong force also. Mr. Miller, Red Bank Gardens, had the best collection of eight dishes, one of the best collections this excellent gardener has ever staged; it consisted of *Cauliflowers*, *Artichokes*, *Turnips*, *Ne Plus Ultra Peas*, *Rosham Park Onion*, *Tomatos*, *Runner Beans*, and *Potatos*. 2d, Mr. T. Evry; 3d, Mr. W. Smith. The prizes in this class were presented by Messrs. Sutton & Sons.

Messrs. James Carter & Co. gave the prizes in the class for six varieties; here Mr. E. J. Day, gr. to W. Emerton, Esq., was 1st; and Mr. George Snow, gr. to Colonel Grant, 2d.

In another class for six varieties, Mr. F. March was 1st, and Mr. George Horsell 2d.

Collections of vegetables shown by cottagers were

very fine, and they staged excellent *Potatos*; the best four dishes came from Mr. G. Whole, who had *Vicar of Lisleham*, *Schoolmaster*, and two others bearing local names. Mr. John Green was 2d with *American Purple King*, *American Rose*, *Vicar of Lisleham*, and *Wiltshire Giant*.

Certificates of Merit were awarded to Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, for a fine representative collection of *Dahlias*; and to Messrs. G. Cooling & Sons, Bath, for *Dahlias*, *Roses*, &c. A stand of cut *Begonias* from Solomon Treadwell, Esq., was highly commended.

BLACKPOOL.

The first show of flowers, fruits, and vegetables, was held in the Winter Garden on the 9th, 10th, and 11th.

GROUPS.

The principal feature of the plant department was the groups arranged for effect; but we were at a loss to know on what grounds the judges came to the decision they did in awarding the 1st prize in the large group to Mr. Featherstone, of Leeds, whose group was formal and stiff while that exhibited by Mr. Williams, gr. to S. Beerlin, Esq., of Didsbury, and awarded 2d, was light and graceful, containing many novelties of sterling merit. These groups covered a space of 300 square feet; for 150 square feet, Mr. Featherstone was rightly awarded the 1st, while the 2d went to Mr. Wood of Burnley.

PLANTS.

For six stove and greenhouse plants in flower: 1st, Mr. Williams, gr. to S. Beerlin, Esq., Didsbury.

The only exhibitor for *Orchids* was Mr. Thornboro, who showed three well flowered plants of *Cattleya Gaskelliana* and *Harrisoniana*, and *Odontoglossum grande*, while a good *O. Alexandra* with fine spike was 1st for single specimen.

For table plants the competition was keen: J. Hill, of Rochdale, was 1st; 2d, Mr. Williams.

For six exotic Ferns, 1st, Mr. Thornboro, who showed nice clean specimens; 2d, Mr. Williams, who showed well, but his varieties were not so distinct specimens.

CUT FLOWERS.

These were only fair, with the exception of the herbaceous collections, the 1st for which was awarded to Messrs. J. R. Callam; 2d, Mr. Shaw; 3d, P. Cardwell.

There were very good *Roses*: 1st for eighteen distinct went to Messrs. Callam; 2d, Mr. Cardwell. *Dahlias* were also fair, the 1st for twenty-four and twelve both being awarded to Mr. C. Rylance, Mr. W. Shaw being 2d in both classes.

Asters, *Carnations* and *Picotees*, *Gladioli*, &c., were shown in quantity, but call for no comment.

Bouquets, *Buttonholes*, and *Sprays* were shown in quantity, but, as is so often the case, the former were far too crowded. The 1st in both ball and wedding was awarded to Mr. Featherstone, while both 2d went to Mr. Rylance. Mr. Thornboro was 1st for *button-holes*—a decent lot, and also for a *ladies' spray*.

FRUIT.

We cannot speak highly of the quality of the fruit, although a few decent dishes were shown.

For collections of six varieties, 1st, Mr. W. Shaw, who had a good *Melon* and *Peaches*, fair *Grapes*, *Cherries*, *Plums*, and *Pears*; 2d, Mr. Thos. Hare, Grantham.

For white and black *Grapes*, two bunches, Mr. W. Smith, of Chorley, was 1st.

The heaviest bunch came from Mr. Thompson. A *Pine* from Col. Dixon secured 1st; while the first in each class for *Figs*, *Melons*, and *Nectarines* was awarded to Mr. Hare.

A fine half-dozen *Peaches* from Mr. Thompson secured him 1st.

Col. Dixon was 1st for *Apricots*.

Apples were shown in quantity. Mr. Rylance was 1st for culinary; while for dessert Messrs. Callam's was the best exhibition.

Vegetables.—The classes for collection only brought one exhibitor, who was worthily awarded the highest honours for a good, well-grown assortment. A good brace of *Cucumbers* from Mr. Thornboro was 1st in its class.

SPECIAL PRIZES.

Special prizes were offered by Messrs. Webb & Son, of Stourbridge, viz., a handsome centre-piece, for meritorious exhibits not mentioned in schedule, which was awarded to the Liverpool Horticultural Company for a collection of plants.

A pair of vases from Mr. J. Wedgewood, Stoke-on-Trent, to Messrs. Callam, for a collection of cut *Roses*; a half specimen *Adiantum Farleyense*, by Messrs. Birkenhead, of Sale.

A Certificate of Merit and a Special Prize were awarded to Mrs. Southam, of New Brighton, for her

handsome dried picture flower groups; and a Certificate of Merit to Messrs. Morley & Son, for flowers of double and single tuberous Begonias.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL: Sept. 8.

The entries were greatly in excess of those of former years, and the quality of the exhibits was very high. Although the season from a horticultural point of view has not been one of the best, it has been a fairly good one, and until last Sunday—when one of the most severe rainstorms experienced in recent years passed over the district—gardeners had not much to complain of. For the first time since the shows of the Society have been held in St. Andrew's Hall all the available space in the large building was utilised. The entrance hall was surrounded with tables for the display of cut flowers, which also occupied one of the lesser halls. The other small hall was filled with vegetables, and the great hall was almost entirely occupied with decorative plants of large size. The striking feature about the exhibition here was, that while there was plenty of colour among the exhibits there was not a great wealth of bloom. The general effect, however, was very good, and was produced by the judicious arrangement of foliage plants. The platform, which is usual, was handed over to Messrs. J. & R. Thyne for decoration, had on it a fine collection of stove plants, rising tier on tier up to a fringe of very graceful Palm trees. Among the whole there was not a single blossom. Variety was imparted to the display by the grouping here and there of a number of the firm's Crotons, Thymel and Regina, which, although they have already been exhibited, were new to most of those who saw them yesterday. Messrs. Thyne received a special Certificate for them from the Royal Caledonian Horticultural Society, but neither of the plants have yet been put into commerce. The greater portion of the area of the hall was occupied with tables of plants arranged for effect. In all there were not fewer than six entries. The 1st prize, along with which was also awarded a Gold Medal given by Mr. John L. Henderson, Vice-President of the Society, was gained by Mr. Ross, of Mr. George Ferguson, Trinidad Villa, Brox. The table was very well finished, banks of Ferns and Crotons, interspersed with Lilies, rising nicely upwards to the central feature, a small Palm tree, which, if anything, however, seemed a little too large for the size of the table. The edges were tastefully screened with plants and grasses of a drooping habit. All the specimens in the collection were noteworthy for their fine, clean, fresh growth. The table which was placed 2d, was not so well covered, there being a deficiency in the groundwork, and the top plant—also a Palm tree—was decidedly too heavy. The specimens were not so cleanly grown as those on the 1st prize table.

The competition for Orchids brought out only four entries, two in each class. The 1st prize for one plant was carried off by Mr. Peter Walker, Hope Park, Donnybridge, with *Vanda Sanderiana*, which seemed to be well established, and was in magnificent flower.

Mr. J. Macleod, Brentnall Park, Stirling, was 1st for two Orchids with *Cyclopogon Massangana* and a *Cattleya*.

The cut flowers all round were of capital quality. Chief among them, the Dahlias, were noteworthy for the admirable manner in which they were exhibited. The 1st prize, with Silver Medal given by Mr. William E. Taylor, one of the Honorary Directors of the Association, was gained by Mr. D. McFarlane, Finlary Gardens, Greenock, with a collection of twenty-four hybrid flowers, which were Vice President Harrison Weir, Statesman, Madam Soubry, and Mrs. Gladstone.

Messrs. Samuel McGredy & Son, Woodside Nurseries, Portadown, sent a stand of Cactus and bouquet Dahlias, which, although they had been rather knocked about in the passage across the Channel, staged very well. One of the sorts, a real Cactus Dahlia, *Glare* of the Garden, attracted a good deal of attention on account of its good form, substance, and exceedingly bright hue. Messrs. McGredy also sent twenty-four hybrid perpetual Rose blooms, which, considering the lateness of the season, were in capital condition.

Several old-fashioned garden favourites turned up among the cut flowers. Mr. Campbell, High Blantyre, for instance, sent a good collection of Hollyhocks. Among these were two seedlings, John Lyon and Sir Garnet Wolseley, the one a full primrose, the other a clear or plum. The judges awarded him a First-class Certificate of Merit for a seedling *Picotie*, Mrs. Campbell, a white delicately edged with pink. Mr. J. Baxter, Daldozie, also received a Certificate for a seedling *Viola*, called *York and Lancaster*, because its petals are striped in the same way as those of the old-fashioned single rose of that name. Mr. Baxter likewise took 1st place in the competition for twelve bunches of *Violas*.

Of the vegetables the general opinion was that they were the finest yet seen in the West of Scotland. Mr. Donald M'Beau, gr. to Mr. J. C. Cunningham, Craigsides, as usual, carried off the chief honours.

The display of fruit was not very large, but it was good as far as it went.

DUMFRIES FLOWER SHOW.

In the Mechanics' Hall the centre of the floor was occupied by the four tables of plants, 16 feet by 8, prepared for competition in the open class. That of Mr. W. H. Scott, of Nunfield, which was justly placed 1st on the prize list, arrested attention by the effect of the grouping, the blending of shades being skilfully and tastefully managed. The principal plants in the group were Crotons, Palms, *Dracænas*, &c., with a nice lot of Orchids in bloom dotted through; and it was edged with a fringe of *Panicum variegatum* and *Isolepis gracilis*. In the group shown by Messrs. Clark Brothers, Carlisle, who received 2d prize, the centre was made up with a beautiful *Cocos Weddelliana* Palm, set round with *Eulalia japonica*. There was a little sprinkling of *Celsia pyramidalis* in the group; and it was dotted throughout with Crotons of very high colour. At each corner there were Palms, set round with scarlet Begonias, this arrangement being very effective; the edging was *Panicum* and *Isolepis*. Captain Maxwell, of Terregles, who was placed 3d in order of merit, showed a group, the centre of which was composed of fine Palms and a magnificent *Dracæna*; and it was inter-spersed with Orchids, a few *Chrysanthemums* in flower, and beautifully coloured small Crotons; the edging was *Panicum*. Mr. Service, Maxwelltown, showed a greater mass of blooms than any of the others, his group presenting quite a gay appearance.

On the left of the hall, on entering, were staged most of the pot-plant exhibits in the professional class. In ornamental foliage plants there was good competition. The best plant of the whole lot was a *Croton D'Israeli*, which was shown by Mr. Scott, of Nunfield, in his group; it was beautifully coloured, well grown, and in every way a gem. The other collections consisted chiefly of Crotons, Palms, and *Pandanus*. The stove or greenhouse plant flowers were in fine condition.

In the amateurs' class, which was staged on the right side of the hall, there were also tables of plants for competition similar to the gardeners', but of a smaller size. In these the display was very attractive. The amateurs' pot plants all through were a most creditable lot. The gardeners' pot *Petunias*, *Chrysanthemums*, &c., which were on this side of the hall, formed a nice group of well-flowered plants.

The platform was principally devoted to fruit and table plants, which were effectively arranged on a raised band behind the tables, or in front of them, looking from the body of the hall. Grapes particularly were very fine, the majority of them being well grown, and of the bloom magnificent.

There were three collections of wild fruit entered. In two—one of which was awarded the 1st prize—no less than fifty different varieties were exhibited.

To have cut flowers in the gallery instead of the vegetables, as in former years, was a very great improvement. Roses were very fine, probably better than they have ever been at our autumn shows; and *Gladioli* and Dahlias were also well worthy of mention. Marigolds were very nice all through.

In the Market Hall, which was devoted principally to what may be called the "useful" or kitchen garden department of the exhibition, were also placed a number of plants for which no room could be found in the larger building. Here were also shown the collections of Ferns gathered in Dumfriesshire—a very interesting exhibit. The 1st prize fell to a lot of eighteen. The 2d group was one of twenty; but in the 1st the plants were considered better grown.

The vegetables were on the whole meritorious. The collections in both gardeners' and amateurs' classes showed care in cultivation. These were staged on the centre table, where were also Onions, Beans, &c. The collections of Potatoes, which were remarkably fine, and Cabbages, Leeks, &c., were on the side tables—the professional classes on the left, and the amateurs on the right; and the Celery, and Onions among the great size; and the pots of Parsley, both in the gardeners' and amateurs' class, reflected great credit on their exhibitors. Condensed from the "Dumfries Standard."

PAISLEY HORTICULTURAL SHOW: September 2 and 3.

THE grand autumn exhibition was held in the Clark Town Hall, which, with the minor hall and the picture gallery, were filled by the exhibitors. The centre of the hall was largely occupied by four huge tables, three of which contained the exhibits of Mr. Stewart, of Kilsnade (gr. Mr. Allan Henderson); Mr. Arch. Coats, Woodside (gr. Mr. James Eve-

ridge); and Mrs. Coats, Ferguslie (gr. Mr. Duncan McDonald). The fourth table was taken up by competitors' exhibits.

The table of exhibits from Woodside was centred by a fine *Kentia Forsteriana*, with a pair of *Cocos Weddelliana*, and bottomed with two magnificent *Gleichenias*, springing from the centre of which was a fine *Lilium auratum*, fronted with a magnificent *Nepenthes Raflesiana*; also two very fine *Mar-nockiana* Heaths, and a mixture of miscellaneous flowering and foliage plants, not the least conspicuous of which were *Nepenthes Lawrenceana* and *sanguinea*, the whole being fronted with a fringe of Club mosses and Russian grasses.

The Kilsnade table was centred by a spacious *Latania borbonica*, flanked with two nice *Arecas*, with a splendid *Ixora* and two beautiful specimen *Pancratiums*, with their white flowers relieved by a dark *Dracæna*, and fronted by a large collection of Heaths, among which were *retorta* major, *Tur-bullie*, *Irbysana*, and *Mar-nockiana*; these, again, were fronted by a choice assortment of Orchids, among which were noticeable some fine *Odonatoglossum Alexandræ* and *granite*, and a very good *Cattleya Gaskelliana*, fringed with an assortment of Maidenhair Ferns, the tasselled *Pacottii* being prominent.

The table with the exhibits from Ferguslie was centred by two very fine *Asplodisa australis*, relieved by grandly flowered Japanese Lilies and a leafy *Coccoloba*, giving a variety of colour which was exceedingly pleasing. *Celosias* and Crotons in variety, and *Dracænas* interspersed with *Valloias*, and scarlet *Pelargoniums* with a parti-coloured *Acalypha* and numerous Maidenhair Ferns, making a very pretty and pleasing effect. The fourth table comprised many fine competitive exhibits.

The four house plants, the 1st prize for which, was taken by Mr. James Maxwell (gr. to Mrs. Arthur Barshaw), were very good, comprising *Anthurium Scherzerianum*, a fine specimen *Lippagaria*, and well-flowered Heaths, the best of which was *Aitonii* Turnbullii. The 2d prize contained a good *Eucharis amazonica*.

The 1st prize for two house plants was gained by Mr. Alexander Johnstone, gr. to Mr. Wood, Oakeshaw, and comprised a beautifully grown *Erica Mar-nockiana* and *Staticia profusa*.

The *Pelargoniums* in the different classes were a good exhibition, as fine as is generally found in any exhibition in the country, being well grown and profusely flowered. The 1st prize *Gladioli* (Mr. Matthew Smith, Prestwick) were exceedingly fine. Both single and double Dahlias formed very meritorious exhibits. Orchids were small, but very nicely flowered. British Ferns were a particularly nice exhibition, as also were Club mosses.

FRUIT AND VEGETABLES

were very good, Mr. James Walls, gr. Southbar, taking 1st prize for collection of fruit with an exceedingly good basket. The same gentleman also took 1st prize for the collection of vegetables. The Grapes as a whole were creditable, and Apples and Pears were very good indeed. Peaches, Melons, and Plums, were a scant exhibition. The table plants in the gardeners' class were shown in the loggia along with the fruit, and were both select and varied. The bouquets were beautiful in point of colour and arrangement, but rather formal.

The exhibits from the different local nurserymen lent additional interest to the exhibition. Mr. William Dickson had a good table of miscellaneous plants, flowering and foliage, suitable for greenhouse and table decoration. Messrs. A. Pattison & Son had a mixed assortment of useful decorative plants. Messrs. William Paul & Son, Crosshat Nursery, had a very fine lot of Palms, Lilies, and decorative plants. Messrs. Wm. Thomson & Son, Clovenford, Galashiels, sent a very nice lot of Grapes.

Obituary.

MR. WILLIAM STEWART. — With regret we have to record the sudden death of Mr. W. Stewart, the head of the firm of John Stewart & Sons, nurserymen and seedsman, Dundee and Broughty Ferry. This business was established in 1809 by Mr. John Stewart, since whose death it has been conducted by his sons.

The deceased, who was the principal partner, carried on the nursery department with energy and success, and through his exertions the firm extended its operations to England, starting a nursery at Ferndown, Dorsetshire. Mr. William Stewart retired three years ago from the active management of the firm, and since then he had lived in the South of England, and latterly in Greenock. Mr. Stewart was seized with an affection of the heart on the Friday, and died the following Sunday, the 12th inst. He was in his sixty-first year, and has left a widow and family.

"COX, OF REDLEAF."—A fine old gardener passed away from us in this parish on August 30, and was buried in the country churchyard of Brading on September 2. A few words in memory of one who was so devoted to horticulture will be welcome to his many friends.

John Cox was born in the village of Buckland, in Berkshire, in November, 1814. His father was principal foreman in the gardens of Sir John Throckmorton. From thence he went to Cornbury Park, in Oxfordshire, at which place he spent the remainder of his life. The son here entered fully into all the details of his business, and besides learning the mysteries of land measurement, geometrical drawing, and such-like things, he became familiar with the management of kitchen gardens, the rotation of crops, &c., and he studied with interest the cultivation of wall fruit trees, in which he afterwards excelled. In 1836 the late Bishop Spencer, who came to Cornbury Park on a visit, took John Cox to his cottage *enrôlé* on the edge of the Derbyshire moors, and he had to battle there with a very inclement climate for several years. His own words about this matter are:—"On arriving at my destination everything looked so desolate that I thought I had made a great mistake, but after a time I became reconciled to the adverse climate, where Green Gages might possibly ripen once in five years, where Keen's Seedling Strawberries were magnificent in August, where Oak trees became tolerably green by the end of June, where common Laurels were either killed outright or were cut down every year by frosts—all so different from the sunny south." But the discipline was invaluable, and Mr. Cox here made the acquaintance of the late Sir Joseph Paxton, from whom he received many kindnesses. From thence he came southwards, and was engaged by Messrs. Knight and Perry, but the great achievements of his life were at Redleaf, in Kent, where he stayed till the year 1884, and where there are still many memorials of his skill in all that pertains to a garden. Trees and shrubs here by thousands speak of him—so to say—still, and splendid Conifers and fine rock-work have made these grounds the admiration of everybody who has been able to visit them. Perhaps in point of rare and beautiful shrubs, alpine and herbaceous plants the gardens at Redleaf, near Pemburst, have few to surpass them. Mr. Cox worked frequently in different periodicals on the cultivation of fruit. He was a frequent contributor to the pages of the *Gardeners' Chronicle*, the *Journal of Horticulture*, and other gardening papers. As a landscape gardener he had abilities of a very high order. His services were also in request as a judge at the large International and other flower and fruit shows held at South Kensington, the Botanic Gardens, Regent's Park, and the Crystal Palace. He was a Fellow of the Royal Horticultural Society, and for many years he served on the Fruit Committee, and in connection therewith he was one of the Associate Commissioners for the Horticultural Department in the Paris Exhibition in the year 1867.

Mr. Cox's health for several years had not been very robust, but in the summer of 1881 he had a sun-stroke, and after this it visibly failed. He came to reside at The Firs, in St. John's parish, near Ryde, and latterly he has been quite incapacitated for all occupation. He leaves behind him a widow, a son, and two daughters. His son is the much respected teacher of drawing at the School of Art in Ryde, which is in connection with South Kensington. Horticulture may perhaps lose votaries who are more widely known than the subject of these few remarks, but there scarcely can be any who has given to it more untiringly the devotion of a life, and who followed out its leadings with more devotion to the end. *H. E. St. John's, Ryde.*

[We are in such thorough sympathy with the spirit and expression of this tribute that we have little to add and nothing to alter in it. Gratitude to one of our oldest contributors on whose knowledge and judgment we could always rely, and respect for a man of high, though unobtrusive character, and great professional ability induce us, however, to point to John Cox as a model worthy of closest imitation by the young race of gardeners. The respectful sympathy of all who knew him will be with the survivors; while those who only knew him by repute will experience a feeling of pride at the record of one who in his allotted career knew his work and did it. A portrait of the late Mr. Cox appeared in our number for September 11, 1875, where may be read a full and very interesting account of his career. Ed.]

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,
FOR THE WEEK ENDING WEDNESDAY, SEPTEMBER 15, 1886.

Sept. 9.—Cloudy; rain till 10 A.M.; fine afterwards.
10.—Morning fine but dull, then heavy rain till the evening; lowest temperature at night.
11.—A fine day.
12.—A fine day, frequently dull, occasionally bright.
13.—A very fine warm day.
14.—A very fine warm day.
15.—Fine morning, afterwards dull and cold; minimum temperature at night.

LONDON: Atmospheric Pressure.—During the week ending September 11, the reading of the barometer at the level of the sea decreased from 30.03 inches at the beginning of the week, to 29.95 inches by the afternoon of the 5th, increased to 30.07 inches by 5 P.M. on the 6th, decreased to 29.76 inches by 9 A.M. on the 10th, increased to 30.06 inches by the morning of the 11th, and was 30.01 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.98 inches, being 0.09 inch lower than last week, and 0.11 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 73°.5 on the 5th; the highest on the 11th was 67°.3. The mean of the seven high day temperatures was 69°.

The lowest temperature in the week was 49°.5 on the 11th; the lowest on the 9th was 59°.5. The mean of the seven low night temperatures was 55°.6.

The greatest range of temperature in one day was 17°.8 on the 11th; the smallest was 10° on the 9th. The mean of the seven daily ranges was 13°.3.

The mean daily temperatures were, 64°.1 on the 5th; 63°.3 on the 6th; 61°.2 on the 7th; 60°.6 on the 8th; 63°.5 on the 9th; 59° on the 10th; and 57°.7 on the 11th. These were all above their averages with the exception of the 11th, which was 0°.3 below; by 5°.5, 4°.9, 2°.8, 2°.3, 1°.4, and 1° respectively.

The mean temperature of the week was 61°.3, being 5°.8 lower than last week, and 3°.1 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 124° on the 6th. The mean of the seven high readings was 114°.1.

ENGLAND: Temperature.—During the week ending September 11, the highest temperatures were 76° at Cambridge, 75° at Leeds, and 74°.2 at Nottingham; the highest at Plymouth and Sunderland was 67°, and at Bradford was 67°.8. The general mean was 70°.4.

The lowest temperatures were at Wolverhampton 39°.1, and at Truro and Sheffield 42°; the lowest at Liverpool was 49°.6, at Blackheath, 49°.5, and at Bradford, Sunderland, Preston and Newcastle 48°. The general mean was 45°.7.

The greatest ranges were at Cambridge 33°.3, at Nottingham 30°, and at Wolverhampton 29°.2; the least ranges were at Sunderland 19°, at Bradford 19°.8, and at Newcastle 20°. The general mean was 24°.8.

The mean of the seven high day temperatures was

highest at Cambridge 72°.6, at Leeds 70°.4, and at Blackheath 69°; and lowest at Sunderland 62°.7, at Plymouth, 64°.9, and at Wolverhampton, 65°.2. The general mean was 66°.9.

The mean of the seven low night temperatures was highest at Blackheath 55°.6, at Plymouth 52°.8; and at Bradford 52°.5; and was lowest at Wolverhampton 46°.7, at Truro 49°.7, and at Sunderland, 50°.4. The general mean was 51°.5.

The mean daily range was greatest at Cambridge 20°.6, at Leeds 18°.7, and at Wolverhampton 18°.5, and was least at Plymouth 12°.1, at Sunderland 12°.3, and at Blackheath and Bradford 13°.3. The general mean was 15°.4.

The mean temperature was highest at Blackheath 61°.3, at Cambridge 60°.9, and at Leeds 59°.7; and was lowest at Wolverhampton 54°.5, at Sunderland 55°.1, and at Newcastle 57°.1. The general mean was 57°.8.

Rain fell on every day at Nottingham, on five or six days at most places, but on two only at Cambridge. The largest falls were 2.74 inches at Preston, 1.95 inch at Liverpool, and 1.16 inch at Bristol. The smallest falls were 0.42 inch at Nottingham, and 0.45 inch at Cambridge and Leeds. The general mean fall was 0.95 inch.

SCOTLAND: Temperature.—During the week ending September 11th, the highest temperature was 70°.2 at Greenock; the highest at Aberdeen and Paisley was 63°.3. The general mean was 66°.0.

The lowest temperature in the week was 43°.1 at Aberdeen; the lowest at Leith was 47°. The general mean was 45°.4.

The mean temperature was highest at Edinburgh 56°.9; and lowest at Aberdeen 54°.8. The general mean was 55°.8.

Rain.—The largest falls were 3.73 inches at Greenock, and 2.84 inches at Glasgow; and the smallest fall was 0.52 inch at Aberdeen. The general mean was 1.64 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

"He that questeth much shall learn much."—BACON.

EDIBLE FUNGUS OF NEW ZEALAND.—*T. V.* wishes to know of any book wherein he may find a chemical analysis of the New Zealand edible fungus, and where he could procure a specimen. *T. V.* is not very definite as to the particular fungus he means. Does he mean the Australian *Cyrtaria*, or the so-called Tasmanian "Native Bread" or what?

SUNFLOWER CULTURE IN EGYPT.—A correspondent is desirous of information as to the best method of cultivating this plant in Egypt, in a locality where there is abundant rainfall from November to March, and an average temperature of 60°. For the rest of the year the temperature averages 78° Fahr. and irrigation is easy. Any correspondent with practical experience would oblige with suggestions.

Answers to Correspondents.

AZALIAS: *F. W. B.* It is well known that these plants yield a gum, but we are not aware whether it has been turned to any useful purpose.

BOOKS: *Ignoramus. A Year's Work in Garden and Greenhouse (Sutton & Windus).—R. S. How to Lay out a Garden.* By E. Kemp, published by Messrs. Bradbury, Agnew, & Co., Bouvier Street, London, E.C., is the work best suited to your requirements. As to the estimating, we do not know of any work dealing with the subject.

PERNS IN OLD MUSHROOM-BED SOIL: *Ignoramus.* The plants will not live long in such material. Get a little loam, peat, and sand; or, failing those, plant in garden-soil manured with leaf-mould and lightened with sand, if that be needed.

GRAPES DECAYING: *F. Orchard.* Your Grapes were almost completely decayed when received. We can only attribute the mischief to the close humid weather. Give more air, and apply fire-brake to make the atmosphere more bracing.

HOW TO LEVEL A LAWN: *A.* The rods are the simplest system of levelling; two rods can be placed on the old ground, and with the third the level can be easily determined at the extreme corner of the new ground. When this has been fixed, a stout pole can be driven into the ground outside the level-peg, and a line stretched tightly from the old field round this pole, will enable the intermediate pegs to be fixed with sufficient accuracy. It will be better to work it in sections of say 20 feet, commencing at the side next the old ground and working outwards. Remove the turf from No. 1 section, and carry it outside the ground to be levelled. If the material to be used in raising the level be old clinkers, odd rubbish, or sub-soil, 9 inches or a foot of the top should be reserved

to place on the top. This should be also removed from the top of No. 1 section outside. When No. 1 is brought up to the requisite level, the turf should be removed from No. 2, and the good soil can be taken off No. 2 and placed on the top of No. 1. The turf can be taken off No. 3 and laid on the top of No. 1, and each section finished as the work proceeds. If the depth of added material be more than 3 or 4 feet, however well it may be trodden down, there will be sure to be a little subsidence, and the turf had better not be permanently relied for a few months. *W. M. B.*

LAPAGERIA: Old Subscriber. Without further information we cannot tell what has done the mischief. It looks as if it had been scalded in some way.

LILIES: A. L. L., Ghent. All three varieties of *L. speciosum*, *alias lancifolium*. Neither is of any special value.

NAMES OF FRUIT: Albert Butcher. Plum: Washington Apple—Winter Redneck.—*T. W. B.* Apple: Red Astrachan.—*A. Neilson.* Apple: Probably Hienheim Orange. Peach: Quite rotten. Nectarine: Violette Hâte. Plum: Golden Gage.—*M. Mairs.* Peach: If the flowers are large it is probably Grosse Mission, if small Bellegrave.—*J. F. Pear.* Beurree d'Assomption.

NAMES OF PLANTS: A. H. *Collonia cocinea.*—*C. M. O.* Certainly not *Silphium laciniatum*; the prolonged receptacle is that of *Rudbeckia.*—*W. M. & Sons.* *Polygonum cuspidatum.*—*T. Walker.* *Solway, Lyme Regis.* The fungus is *Uromyces Fabae* mixed with itsredo form.—*W. B. Red.* *Kiss d'Alpin*, a British plant.—*H. W.* *Crinum Moorei*, a pale variety.—*Old Subscriber.* 1, *Abies (Picea) nobilis*; 2, *Abies (Picea) Lowiana.*—*A. C.* 1, *Odontoglossum grande*; 2, *Cattleya velutina*; 3, *Zygopetalum Mackays.*—*H. W.* 1, Please send flowers when out; 2, *Zygopetalum intermedium*; 3, *Dorstenia argentea*; 4, *Lomaria discolor.*—*G. L. C.* 1, *Veronica spicata*; 2, *Gnaphalium margaritaceum*; 3, *Euonymus Europæus*, the common spindle tree; 4, *Pulmonaria officinalis*; 5, *Valantia Crucifera*; 6, *Solidago*, perhaps *S. aurea.*—*Cent. & Brydon.* We cannot name *Chrysanthemum*; send to some grower.—*H. E.* It seems to be a variety of the White Bae, perhaps *P. Aria var. latifolia.*

PEAS SOWING: C. M. O. This is to be understood as 2 to 3 inches apart, several lines in one drill.

PELARGONIUMS IN WINDOW: Ignoramus. We cannot say why they do not flower. The drainage may be bad, and the soil sour, or they get too little sun, or they are chipped.

POTTING-SHED FLOOR: A. C. Boyd. Clay and brick-chippings, two parts of the latter to one of the former, well mixed to the consistency of plaster, and laid down from 2 to 3 inches thick. But a much better floor, and one that will stand for any length of time is the following.—Three measures of coarse gravel to one of best Portland cement. A layer of this 1 1/2 inch thick should be put down on a good bottom of broken stones or other dry material. *W. M. B.*

ROSES: Ignoramus. Plant in sound turfy loam, to which one quarter of its bulk of rotten manure has been added. Plant in October.

WHITE Poppies: Viridita. The seeds yield an oil, but we doubt whether it would be worth while in this country to grow them for that purpose, and still more do we doubt the desirability of growing them for perfume. We are quite unable to answer your question as to the value of a French bank-note of 1792; you do not even say what the amount is.

SEEDS.

LONDON: Sept. 15.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report to-day's market thinly attended, with but little business passing. Trifolium moves off slowly at the extremely low rates current. Winter Tares are in good supply, and are also extremely moderate in price. Seed Rye unchanged. Bird seeds on the spot are firm; Hemp seed, for forward delivery, however, is cheaper than ever before known. The new samples offering of foreign red Clover seed fail to find buyers. For blue Peas quotations still point downwards. Feeding Linseed is cheaper.

CORN.

MARK LANE: Sept. 13.—Runs of new Wheat, not guaranteed over 63 lb., were quoted 32s. to 32s. for white, and 30s. to 32s. 6d. for red; 64 lb. averages 12s. more. Hard dry foreign Wheats suitable for mixing meet inquiry, and for Indian the rates paid ruled firmer. American sold the turn cheaper. The same has been the case with American flour. Grinding Barley is rather lower on the week. Fine malting scarce and more inquired for, ordinary qualities dull. Maragan Beans were 6d. dearer. Peas unaltered. Oats met a dull sale, and common qualities were 3d. down for the week.

Sept. 15.—The receipts of English Wheat were light but imports of foreign rather large. For both, the inquiry was very limited, and prices almost nominal. The tendency, however, was against the producer. Flour, of which the arrivals were in excess of requirements, was depressed. Grinding Barley was scarce of sale at late rates. Good malting sorts were in scanty supply, and firm. Oats sold slowly at Monday's rates.

Average prices of corn for the week ending September 11:—Wheat, 32s. 5d.; Barley, 29s.; Oats, 19s. For the corresponding period last year:—Wheat, 31s. 1d.; Barley, 31s. 11d.; Oats, 19s. 11d.

POTATOES.

BOROUGH AND SPITALFIELDS: Sept. 13.—Dull trade, and demand confined to best samples. Magnum Bonum, 60s. to 80s.; Kent Regents, 70s. to 90s.; Hebrons, 70s. to 100s.; Early Kosas, 60s. to 70s.; Essex Shaws, 60s. to 70s. per ton.

STRATFORD: Sept. 14.—Magnums, 65s. to 70s.; Schoolmaster, 60s. to 70s.; Regents, 60s. to 70s. per ton.

COLUMBIA (East London): Sept. 15.—Quotations:—Lincoln Magnums, 60s. to 70s.; Kent and Surrey Regents, 70s. to 85s.; and Beauty of Hebron, 70s. to 95s. per ton.

Imports.—The imports into London last week consisted of 64 tons from Barfleur, 4 baskets from Rotterdam, 420 bags from Ghent.

Government Stock.—Consols closed on Monday and Tuesday and Wednesday at 100 to 100 1/2 for account, and 100 1/2 to 100 3/4 for the account. The final record on Thursday was 100 to 100 1/2 for account, and 100 1/2 to 100 3/4 for the account.

To Nurserymen, Seed Merchants, and Florists. **J. BLACKBURN AND SONS** are offering Archangel MATS lower than any other house in the Trade. Also Petersburg MATS and MAT BAGS, RAFFIA FIBRE, TOBACCO PAPER, and Shading Materials. Prices fixed on application.—4 and 5, Wormwood Street, London, E.C.

BOULTON & PAUL, NORWICH.

With new and important improvements. For the Water Supply of Villages, Institutions, Mansions, Gardens, Greenhouses, Stables, Fruit Fields, Farms, &c.

Gold Medal awarded at Calcutta Exhibition, 1884. Made in a variety of sizes to suit different soils and falls of water. Give constant supply for many years with but little attention and outlay beyond the first cost.

Prices upon application from £4 4s.
COPY OF TESTIMONIALS.

"Honoured Sirs,—In answer to your letter this morning about the Ram, it is working well, lifting over 12 pints per minute, the size of supply pipe being 2½ inches, the length 23 feet, the fall 1½ feet 6 inches, the delivery pipe being 1 inch to the fountain, the length of pipe 120½ feet, rise of pipe from ram to fountain 76 feet, ram lifting 12 pints per minute."
"I remain, your obedient servant."

"JOS. MILLARD,
"Gardener to Sir Alexander Acland Hook."

"Gentlemen,—Please find cheque. I have much pleasure in saying that I was asking the gentleman the end of last week how the Ram was working for him. He said it was working well, and he would not be without it for £200."
"Yours truly,"

"ISAAC MILBURN,
"Range Manufactory, Strand Street, Douglas."

"Messrs. Warner."
"W'Alford Rugby, October 23, 1883."
"Sirs,—The Ram you have just put up for me gives me great satisfaction. With the 12 gallons per minute supply it raises, about 600 gallons, 30 feet (I think), in ten hours, and is no trouble to start working. I hope it will continue to work as well, for it is a great convenience."
"I remain, yours truly,"

"JOHN GEE,
"Messrs. Warner & Sons."

"Dear Sirs,—You will no doubt be glad to learn that the Ram you came down to advise about for Showter has been fixed, and so far answers the purpose admirably."
"Yours truly,"

"J. S. BROWNING,
"Newton, Stockfield-on-Tyne, December 20, 1886."

"Dear Sirs,—The Ram I had from you a short time ago is giving every satisfaction. Please send the duplicate valves for it, and oblige, yours, &c."
"JOSEPH SYMM."

"138, Widenorsh Street, Harford, September 14, 1885."
"Dear Sirs,—The Rams you supplied to me last year give every satisfaction. I have not heard of their stopping since they were fixed.—Yours faithfully,"

"ROBERT BARMFORD."
"Kelvedon, Essex, January 13, 1886."

"Gentlemen,—The Ram which I fixed at Little Ereated Mill or J. Fisher, Esq., is much pleased to say, gives great satisfaction, and seems quite undeflected by the Road, working well when quite submerged by water and even left to sight, its locality only indicated by the bubbles on the pulse-valve, and notwithstanding the heavy frost we have had it has only stopped once. It throws off some 250 gallons in twenty-four hours.—Yours truly,"

"JOHN WARNER & SONS,
"Gracient Foundry, Cripplegate, London, E.C.; and the Foundry Works, Walton-on-the-Naze, Essex.
To be obtained of every Ironmonger and Plumber in every Kingdom."

WHY IS WOOD'S GOLD MEDAL BOILER THE BEST FOR GREENHOUSES.

Manufactured to exact dimensions, and ready for fixing. Apply for quotations as above.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago, and its popularity is its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing with turpentine, and is used only on the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or at 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"From ALFRED LOWE, Esq., The Rivers, Albury Lodge. 'Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted.'"

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HENRY PEASE & CO.'S SUCC'RS,
SPINNERS and MANUFACTURERS,
and Sole Makers of the Celebrated

GOLD MEDAL

DARLINGTON DRESS FABRICS,

Ladies are at liberty to change any goods within seven days, and should not fail to see our large box of Autumn and Winter patterns, post free. All Parcels, Carriage Paid.

The union of warmth to lightness, so necessary to health is in these materials brought to perfection.

The fineness of the wool of which they are composed—English Wool, be it understood—imparts the admirable quality of draping in those soft folds now so essential from the point of view of fashion.

These fabrics were awarded, at the all-England competition, the GOLD MEDAL of the CLOTHWORKERS' COMPANY, London. Also the Highest Prizes at the Exhibitions of 1851, 1861, &c., and wherever exhibited.

AS AN ADDITIONAL GUARANTEE TO LADIES that we are the actual Manufacturers, and not mere following Drapers or Self-styled Manufacturers, we subjoin the following Certificate, viz.:-
"Having examined THE 'RECORD OF WAGES' paid by us, we hereby certify that the number of workpeople employed in the PRODUCTION of YOUR MANUFACTURES was, on August 13, 1886,
ONE THOUSAND AND TWENTY-SIX.
—MONKHOUSE, GODDARD & Co., Chartered Accountants, Middleborough and London, August 16, 1886."

SPECIAL ATTENTION is directed to our celebrated CROSS-WARP SERGES, which, alike, resist the effects of weather and sea, 10½d. to 3s. per yard; for Men's and Boy's wear (including the "Clerical" Serge), these will be found "clear away" the best value procurable, 2s. to 8s. 6d. per yard (56-in. wide). Our GOLD MEDAL CASHMERES, in all the New Colourings, from 1s. 6½d. to 4s. 6d. per yard. NEW and FASHIONABLE COSTUME CLOTHS in great variety, from 6½d. to 5s. per yard, including "The LOWSTOCK," "The ASHEIURST," "The DAMIETTA," "The KHAIBER," "The SHUMLA," "The TARAPACA," "The PANAMA," "The HOLSTEIN," "The ZEELAND," &c.

CHARMING NOVELTIES in SKIRTINGS, including "The YESSO," "The NINGPO," "The FOO-CHOO," &c.

THE DARLINGTON BLANKETS (sent on approval) are warranted Pure Wool. Money returned if not approved of. In all sizes and four different qualities. THE DARLINGTON MEN'S UNDERCLOTHING (Pants and Vests), all Pure Wool, are made on our own premises. Sent on approval.

Address—HENRY PEASE & CO.'S SUCCESSORS,
SPINNERS and MANUFACTURERS, THE MILLS, DARLINGTON. Established, 1752.
Please mention "Gardeners' Chronicle" in sending for Patterns. All Parcels, Carriage Paid.

Published at the Office of the Gardeners' Chronicle, 41, Wellington Street, Strand, W.C.

To Travellers, Commission Agents, &c., having influence amongst Fruit Growers, Nurserymen, and the Trade generally. WANTED, by an old-established English house, influential REPRESENTATIVES throughout the United Kingdom and abroad, to introduce Plans of certain striking and most valuable novelties in the Fruit and Vegetable Address, REVOLUTION, T. W. Hannaford, 75, Ludgate Hill, London, E.C.

WANTED, a WORKING PARTNER (Florist), with some capital who thoroughly understands Growing for Market—700 feet run of Glass besides Pits.—H. B. Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, by one who has had good general experience in both branches, a WORKING PARTNERSHIP, in an Old-established Nursery and Seed Business.—For full particulars apply to A. Townsend's Nurseries, Fordham, Salubn.

To Nurserymen's Assistants. WANTED, a steady industrious Young MAN, with full knowledge of Fruit and Plantation Trees and Gardening, to join advertiser in starting a Nurseryman's Business at Bridgewater, on mutual terms.—S. Z. Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

Borough of Sunderland. HEAD GARDENER. WANTED, by the Corporation of Sunderland, a thoroughly Scientific and Practical Man, as HEAD GARDENER, to take entire charge of the Public Parks in the Town, which are about 35 acres in extent, and include large Conservatory or Winter Garden, and other Glass Houses.

Salary, £2 per week, and free house, rates, gas, firing, &c. Applications, in applicant's own handwriting, stating experience, age, number of family (if any), and name and address of last present employer (if any), together with three testimonials of recent date, must be forwarded to the Town Clerk's Office, 24, Fawcett Street, Sunderland, not later than 11 o'clock at noon on the 14th INSTANT, endorsed "Head Gardener."

By order. FRAS. M. BOWEN, Town Clerk. Sunderland, September, 1886.

WANTED, a HEAD WORKING GARDENER, for four men are kept. Must thoroughly understand Vines. Married man, without family, preferred. Wages, 20s. per week with house and coals.—W. Z. RATCLIFFE, 31, Castle Street, Liverpool.

Gardener. WANTED, on a Gentleman's Estate, in Oxfordshire, a good practical WORKING GARDENER, married, must write well, keep simple accounts, and willing to make himself useful. Good cottage and vegetables free. Wages 18s. a week.—Write to J. EVANS, Esq., Woodfield, Bicester.

Gardener. WANTED, a Man and his wife, without family, as GARDENER and LANDRRESS. He must have knowledge of Hot-house and Greenhouse Work, as well as Kitchen Garden, and she must be a thoroughly good housewife. Good wages, comfortable dwelling. Coals and gas free. Apply by letter to W. M. REDPATH, Chemist, Tulse Hill, Lower Norwood, S.E.

WANTED, a GARDENER, near London, where a second Gardener is kept. Must be thoroughly practical in all branches, and have a first-class character. Abstemious preferred. Wages 28s.—Address, C., at Horncastle's Central Advertisement Office, E.C.

WANTED, a FOREMAN, an energetic man to take charge of the Plant Department. Must be thoroughly experienced in the Cultivation of Stove and Greenhouse Plants.—Applicants to state age, experience, and wages expected, with names of particulars, to S. D. A., Messrs. Blenheim Gardens, Woodstock, Oxford.

WANTED, an experienced energetic PROPAGATOR and GROWER of Roses under glass. Preference given to a man who in addition can grow Eucharis, &c., for a Cut Flower Trade.—Apply, stating age, experience, wages, and particulars, to S. D. A., Messrs. Nutting & Sons, 106, Southwark Street, London, S.E.

To Trade Growers. WANTED, for a Nursery near London, an energetic Man as GROWER and PROPAGATOR, experienced in producing Cut Bloom in quantities.—Apply, stating age and experience, to HORTUS, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

MESSRS. W. CUTBUSH AND SON REQUIRE for their Jobbing and Landscape Department, a thoroughly competent energetic MAN. One who is able to give Plans, Specifications, Estimates, &c. Only those who have filed a similar situation, and whose characters will bear strict investigation, need apply.—Highgate, London, N.

WANTED, an active young MAN, who understands Growing Flowers for Market. Must have been employed in Market Nursery. He will be required to look on Shrops. Must be able to Drive in Town.—10, Cumberland Park, Willesden Junction, W.

ORCHID IMPROVER WANTED. Apply, J. R. W., 345, Gray's Inn Road, King's Cross, N.

WANTED, a MAN, to take charge of Glass Department of a Nursery, assist with Wall Trees, &c.—FRANK HUGHES, The Gardens, Overbury Court, Tewkesbury.

Working Superintendent. THE BURIAL BOARD for the Parish of St. Margaret, Barking, intend to ELECT a WORKING SUPERINTENDENT of the Burial Ground at Ripple-site, Barking. Applicants must state age, nature of last employment, and number of family (if any). The salary will be £4 per week, with lodge rent, subject to a week's notice, and to be paid on the 1st of each month, and will be those generally devolving upon a Working Superintendent. Particulars of which may be obtained upon application at the Office of the Board, and Applications, accompanied by Copies of testimonials, to be sent to the undersigned, on or before the 20th inst., and such copies will not be returned. No application will be received unless accompanied by a notice so to do. C. H. MILLS, Clerk to the Board. Barking, Essex.—September 10, 1886.

WANTED, by a General Florist, Nursery, and Seedsman, a smart SALESMAN well up in the profession. (Hibernaceous Plants a speciality.)—ENTERPRISE, T. W. Hannaford, 75, Ludgate Hill, London, E.C.

WANTED, a CARPENTER, on a Gentleman's Place, in that can do Painting and Glazing preferred.—J. FOWLERMAN, The Gardens, Hackwood Park, Basingsstoke, Hants.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender. It is most annoying to receive a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Address, and also a Reference to the Advertisement which they wish Repeated.

B. S. WILLIAMS begs to intimate that he has an appointment in the Nursery and upon his Register some excellent Plants, in competition with the situation of HEAD GARDENER, BALIFF, FOREMAN, or JOURNEMAN. Ladies and Gentlemen requiring any of the above will please send full particulars when the best selections for the different capacities will be made.—Holloway, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Wood, London, N.

SCOTCH GARDENERS. JOHN DOWDIE, Seedsmen, 44, Princes Street, Edinburgh, has at present on his List numerous SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

Gardeners, Under Gardeners, Bailiffs, &c.
W. M. CUTHBURN AND SON have at the present time on hand many characters who will bear the most investigation, and such as from their personal knowledge can recommend as to abilities, &c. Ladies and Gentlemen requiring either of the above can be suited with reliable persons by applying and stating all particulars to **W. M. CUTHBURN AND SON**, Highgate Nurseries, London, N.

Gardeners.
THOMAS KENNEDY AND CO. have on their Register a number of first-class **GARDENERS**, **FORESTERS**, &c., wishing engagement, and will be glad to furnish particulars to any one who would care to same.—**THOMAS KENNEDY AND CO.**, 108, High Street, Dumfries, N.B.

To Gentlemen and Market Growers.

CARPENTER, on a Gentleman's Estate.—Understands the Erection and Repairs of Greenhouses, Cottages, Farm Buildings, Fencing and Glazing. First-class testimonials.—**T. C.**, Ivy Cottage, Wraybury, Staines.

HOLLOWAY'S OINTMENT and PILLS.—Rheumatism and Rheumatic gout are the most dreaded of all diseases, because their victims know that they are safe at no season, and at no age secure. Holloway's Ointment, after fermentation of the painful parts, gives greater relief than in any other application; but it must be diligently used to obtain this desirable result. It has been highly commended by rheumatic subjects of all ages and of both sexes, for rendering their attacks less frequent and less vigorous, and for preserving the four respirations and southing the blood. In many cases Holloway's Ointment and Pills have proved the greatest blessings in removing rheumatism and rheumatic gout which has assailed persons previously and at the prime of life.

The Stock in the above Sale is among the finest in the trade. Catalogues now ready, and may be had at the place of Sale or of the Auctioneer, Wirksworth.

TO BE DISPOSED OF, an Old-established

T SEED, FLORIST and FRUIT BUSINESS, at Kendal, Westmorland, in a most desirable and profitable situation, for reasons for disposal. Incoming light. A rare opportunity for a pushing man.

Apply to JOHN MONKHOUSE, Avonmouth, Kendal.

FOR SALE, a Bargain, a Small FRUIT

NURSERY of Bearing Standard and Ornamental Trees and Shrubs, in a most desirable situation. For description, &c., apply to Mr. J. CARELESS, Solicitor, Hereford.

Market Square, Retford.

TO BE SOLD, solely on account of ill-health, the old-established business of NURSERY and SEEDSMAN, as carried on by Mr. W. Wright for the past thirty years. The shop situated in Market Square, Retford, is a really good Agricultural and Garden Seed Trade, and is worked at a very small expense. The Land (7 1/2 Acres), with five minutes' walk from the town, is worked with a NURSERY, and part for Market Gardening. The Nursery Stock is General, such as Roses, Laurels, Yews, Hollies, Box, &c. A considerable quantity of Fruit Trees, such as Apples, Pears, &c., for which it is very suitable, and my Clergy, both Seed and Plants, commands a ready sale. The above will be sold together, or separately, at the discretion of the Auctioneer. Full particulars from W. WRIGHT, Market Square, Retford.

Little Posbrook, South Hants.

2 1/2 miles from Fareham Railway Station

TO MARKET GARDENERS, FLORISTS, FRUIT GROWERS, & OTHERS.

TO LET, with Immediate Possession, solely in consequence of the death of the Manager, a range of 30 VINERIES, GREENHOUSES, ORCHARD, CUCUMBER, and TOMATO HOUSE, covering about 1 1/2 acre. The Houses are heated by 3 Boilers, and work on the most economical principles. Within the last year, 20 acres of LAND, of the finest quality, partly planted with Orchard Trees, now in full bearing. There is a good Manager's House, and a large quantity of Fruit Trees, such as Apples, Pears, &c., of the best in England for the growth of Fruit, Roses, Cut Flowers, or for Market Garden purposes. The whole of the plant and stock may be taken, or any part thereof, at the option of the purchaser. Further particulars may be had of C. B. SMITH and GOLDSMITH, Fareham and Portsea, Hants.

To Gardeners, Nurserymen, and Others.

TO BE LET, within three minutes' walk of the railway station, a capital NURSERY and FRUIT GARDEN, containing One acre of the Greenhouse, 120 feet long (fitted with hot water Apparatus), Stable, Shed, and Piggeries. Including magnificent Greenhouse and Buildings, and about 4500.

Apply Mr. ALFRED DARRY, Chelmsford.

Vinstone Nurseries, near Plymouth.

TO BE LET, from Lady-day next, for a Term of 7, 14, or 21 years, these well-known NURSERIES, for many years so successfully carried on by the late Mr. Pootney, and since by Mr. Serpell, are situated about a mile from Plymouth, and consist of a Nursery, with a Dwelling-house, Two Gardener's Cottages, large Greenhouses, Melon-pit, &c.

Apply to WOOLCOME and FRIDHAM, Solicitors, Plymouth.

'NEWTON' NURSERYMEN.

NEW DESSERT APPLE, "Beauty of Bath."

GEO. COOLING & SONS

Have pleasure in offering a small Stock of this fine early Dessert Apple.

It ripens in July and early part of August, is quite distinct, of medium size, exceedingly handsome in appearance, being beautifully striped with red towards the sun, has a brisk, sweet flavour, and is in every respect far superior to Juneating or Irish Peach; it is a large and certain cropper, and on that account will be most valuable as a market variety.

During the past two seasons it has been awarded First Prizes in the Dessert Classes at Taunton, Trowbridge, Weston-super-Mare, Kew, and other West of England Shows, where Apples are always well exhibited.

Strong Maiden Trees, 8s. 6d. each; Pyramids, 5s.

Usual Discount to the Trade.

As our Stock is very Limited, we respectfully solicit early Orders.

THE NURSERIES, BATH.

A. B. C.

BULB GUIDE.

Prepared with very much care, containing much reliable information upon Bulbs generally, including the following families:—

HYACINTHS, TULIPS, CROCUS, SNOWDROPS, CHIONODOXAS, GLADIOLUS, &c.

Very extensive lists of varieties of these are included, consisting of nearly every variety which can be considered worth growing.

IRIS.—Of these I hold one of the finest collections in the world; six pages are devoted to this family alone.

HELLEBORES, or CHRISTMAS ROSES, are a great speciality at Tottenham. The collection is very complete, and the plants are exceptionally good. I have thousands of fine, strong, healthy clumps of the varieties major, maxima, caucasica, Madame Fourcade, and many others.

DAFFODILS and LILIES

constitute Part II of my Bulb Catalogue.

Twenty-six pages being devoted to them. Both families are cultivated by me most extensively, my collection including almost every variety in cultivation. These have been shown most extensively during the present season at the Great London Shows, and have been very much admired, and have done much to assist in securing for me the many Awards it has been my pleasure to receive.

Copies of this most complete and interesting Catalogue may be had gratuitously upon application to

THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM, LONDON.

RHODODENDRONS and AZALEAS.

ISAAC DAVIES & SON

Have pleasure in calling attention to their extensive stock of Rhododendrons and Azaleas of all descriptions, for Planting or forcing, which are this year healthy, bushy, and well budded. The Azalea mollis are remarkably fine and well budded, and they offer good bushy Plants, full of buds, at 10s. to 15s. per dozen; 20s. to 60s. per 100. They have also offer, in quantity, Hollies, Aucubas, Laurels, Retinospermas, Flowering and Ornamental Trees and Shrubs, Lilium auratum, &c.

The stocks of these are unusually fine, and the prices are very moderate. Catalogues post-free on application.

Waddon Manor, Baron F. or ROTHSCHILD'S, and Elythrop, Miss ALICE B. ROTHSCHILD'S—together the most extensive, successful, and best stocked places in the history of English Nurseries—were supplied principally from the Knap Hill Nursery.

Intending planters are invited to inspect the Plants growing; no one interested in such matters will regret the trouble. Catalogues convey but a very inadequate idea of such a stock.

A DESCRIPTIVE CATALOGUE will be sent on application.

Knap Hill Nursery, Woking, Surrey.

THE **Gardeners' Chronicle.**

SATURDAY, SEPTEMBER 25, 1886.

DOWNSHIRE HOUSE.

THIS is one of those old-fashioned places that are to be met with round London, where there has been little attempt at modernising the grounds, a process which, unless carried out with judgment, generally results in an incongruous association of old and new ideas, the latter of which often go far to destroy the character of the place without introducing anything that can be set down as a compensation for the loss.

The estate, which is situate in the still rural district of Roehampton, at one time belonged to the Marchioness of Downshire, but has been in the possession of Mr. Chapman for more than forty years. The garden front of the house overlooks a park-like scene, with undulating sward, fine sweeps of lawn, noble trees, and suggestive distance, conveying a delicious sense of quiet beauty and repose, almost the only sign of human presence visible being the distant spire of a church at Richmond.

Scattered about the lawn are a number of old trees, including Sweet Chestnuts, Oak, Elm, Beech, Larch, Turkey Oak, Lebanon Cedar, and Mulberry. Evergreens, consisting of most of the ordinary kinds, thrive luxuriantly, Hollies and Rhododendrons especially: of the former, standing out on the lawn, there is one of the most perfect specimens we have met with of Waterer's golden variety—it forms a pyramid 10 feet high, and 15 feet through at the base, its lower branches lying flat on the turf. Although so dense that a sparrow could scarcely find its way between the leaves, there is a pleasing irregularity in the surface, which has not been subjected to the terrible trimming process which specimen evergreens sometimes undergo.

Southwards from the lawn the ground slopes quickly; here is a flower garden arranged in the usual geometrical style. This flower garden is one of many, full to overflow with gay flowers, and bordered by low banks of Clematis and Roses. The planting is nicely done, the colours are bright and effective. A couple of beds filled with seedling tuberous Begonias of various colours, with an edging of Alternantheras and Echeverias, had a pretty effect. There is here a good specimen of the Maiden-hair tree, Salisburia adiantifolia. The site for this flower garden has been well chosen, as it is sufficiently below the level of the lawn for the blaze of colour not to intrude between the eye and the view of the surrounding country; this, though highly objectionable, particularly in an old-fashioned place, often appears not to be sufficiently understood. About 10,000 plants are used for bedding, all of which are grown on the premises. The grounds extend considerably southwards, ending in a dell, which is nicely laid out with evergreen and deciduous shrubs and trees. Amongst the latter is an example of Salix babylonica, with its trunk clothed with Ivy. In this direction also the Rhododendrons are a prominent feature, thriving luxuriantly, large clumps of them growing to a height of 10 or 12 feet. A few beds here are filled with tropical

plants that are appropriate to the situation, which affords them the requisite shelter from strong winds. In the centre of this cool spot there is a small basin planted with water Lilies, and in whose glassy surface the surrounding trees, a bright clump of Phloxes, and the cheerful foliage of the variegated Negundo, are mirrored. An arbour, from which in hot weather can be enjoyed the refreshing sound of the trickling water as it escapes from a miniature pond, recently made, completes the arrangement of this sheltered nook. From this a return walk, overhanging in places by tall trees, bounded by dense banks of evergreen shrubs, leads back to the higher ground in the direction of the house. Here is a temple brought from Athens by Lord Duncannon. It is exquisitely proportioned, and from it a nice view of the undulating country toward Coombe Wood is obtained.

The kitchen garden, which is situated on the southern side of the flower garden, is enclosed by walls, and lies well to the sun. Across the northern end is a straight walk, with a mixed border right and left, filled with standard and bush Roses, Hollyhocks, kept to the ground all the winter; Delphiniums and Phloxes at the back, with low-growing herbaceous plants in front, mixed with annuals and summer bedders, some or other of which keep blooming from early spring to autumn, and furnish a wonderful variety and profusion of bloom. The wall running parallel with this walk is covered with Peaches and Nectarines, mostly young trees in excellent bearing condition; in fact, if there is fault to be found with them, it is the enormous crops they are allowed to carry, and which nothing but the attention that is given in supplying them with an abundance of water at the roots and overhead, and keeping them free from insects, admits of their bringing to maturity. A sewage-tank contributes its share to the nutriment of the trees. The sorts consist of Early Alfred, Early Louise, Early Rivers, Stirling Castle, Bellegarde, Royal George, Alexandra Noblesse, Grosse Mignonne, and Diamond Peaches; Pine-apple and Lord Napier Nectarines. All the trees were bearing an immense crop of splendidly coloured fruit, that, in addition, had a brightness about it that is peculiar to fruit that is cultivated under glass, and not usually met with in that which is grown on open walls. The other aspects of walls are occupied by Pears and Plums; of the latter a beautiful crop was ripe, including such varieties as Coe's Golden Drop, Kike's, and others. Standard trees were also bearing well. Apples, though many are on the Paradise, as elsewhere, were mostly thin. Of Pears some sorts were a fair crop, others thin. Culinary vegetables in their several kinds are very well managed, both as regards the winter crops and the summer. There is another kitchen garden, of about 2 acres, at a short distance away, where bush and other fruits are grown.

In the glass department, devoted to fruit culture there are two Peach-houses, each about 40 feet long; in the earliest house the crop had been cleared some time. A large tree of Noblesse Peach planted thirty-eight years, and which shows signs of dying off, is being replaced by one of Mr. Rivers' seedlings—Condor, a large bright coloured variety, not much known, but which is recommended as a good early forcer, but which requires setting. The second house is timed to come in so as to get the fruit cleared when Peaches from the open walls come in; the crop was about over. Lord Napier is considered the best Nectarine. The best Plums are Rivers' Early Prolific, Jefferson's, and Coe's Golden Drop. The trees in both houses are full of good healthy wood, the foliage clean and in a condition that promises well for another season. Two lean-to-houses are occupied by Vines that bear plenty of fruit, but from the houses being filled all the year round with Ferns and other water-loving plants the Grapes do not colour well. Amongst other things a nice lot of seedling Gloxinias were in flower in one of these vineries.

In the plant stove there are some large examples of *Eucharis amazonica*, vigorous and blooming well, being free from the destructive little mite that has wrought such havoc in many places with this fine flowering plant. In large growing fine-leaved subjects are good specimens of *Anthurium Warocqueanum* and *A. crystallinum*, but the greater portion of the occupants of the house are small stock suitable for room and table decoration. These include some

of the smaller growing Palms, Crotons, Dracenas, *Pandanus Veitchii*, and others of like character which are collectively remarkably well grown, and bright in colour. In the Cucumber-house adjoining was a nice lot of *Euphorbia jacinthiflora*, strong and in good condition. This, which is amongst the brightest of bright blooming winter plants, seems not to be now so much grown as it used to be; many fail with it through giving too much pot-room and over-watering it when little growth is going on, both of which the plant has a dislike to.

A lofty lean-to conservatory, with an iron roof, was gay with *Lilium aratum*, tuberosus *Begonias*, *Achimenes*, the early white-flowered *Chrysanthemum Madame Desgrange*, and *Petunias*, intermixed with Palms, Ferns, Coleus, and other foliage plants. With them was a good pair of specimens of *Rhynchospermum jasmimoides* grown in pots. Against the back wall, planted out, are some large examples of *Plumbago capensis*, *Heliotrope*, &c.

The pits and frames are occupied by a healthy stock of *Primulas*, *Cinerarias*, and *Calceolarias*, which are very well done, as also *Poinsettias* and *Bouvardias*, the last named planted out in a pit, where they are allowed to flower, heat as required being turned on. Out-of-doors were stood a number of *Camellias* that occupy the conservatory in winter. With them also were a quantity of *Azaleas*, varying in size from large bushes to the pretty little standards, which the Belgian growers cultivate in such numbers; they were in beautiful condition, full of free growth, and profusely set with bloom-buds—their leaves as free from any trace of thrips or red-spider as if these pests were non-existent.

Chrysanthemums, of which some 450 are grown, and of which Mr. Sullivan, the gardener, is a successful exhibitor, were in fine order. The cultivation is directed to the production of large, fully developed flowers; no trained specimens are grown; each plant is confined to a single stem, which is stopped once and allowed to form three branches, the buds on each of which are thinned to a single flower. The stems were as ripe, and almost as hard in the wood as a walking-stick, though carrying their leaves fresh and green to the bottom—a condition that promises well for the production of fine blooms. Notwithstanding the somewhat formal character of the flowers of many of the varieties of *Chrysanthemum*, and the sameness which an assemblage of them presents, there is nothing in the way of late autumn flowering plants that give such a bright, cheerful looking mass of colour as this at a time when there are comparatively few things to choose from. The garden and grounds collectively are well kept, clean, and justify the confidence and satisfaction which the owner feels with regard to his gardener.

becoming, just beneath the tube, of a dusky purplish-grey, or dark slate colour. The tube of the spathe is $\frac{1}{4}$ inch long, $\frac{3}{8}$ inch thick, ellipsoidal, green, mottled and suffused with red-brown. The limb of the spathe is 5 inches long, by 2 inches broad, oblong obtuse, with a short convolute apiculus, concave, with revolute margins; the inner surface is transversely rugulose, white, more or less suffused with a very pale carmine wash, giving it a faint pinkish tinge; outside it is shining white, densely covered with pale carmine lines. The spadix is as long as the spathe; the female part is cylindrical $\frac{1}{2}$ inch long, with densely crowded, somewhat compressed-globose, light yellowish-green ovaries, with white stigmas and containing about five or six erect basal ovules; the neuter or staminoideal part is about $\frac{1}{4}$ inch long, cream-coloured or pale ochreous; the male part is $\frac{3}{8}$ inch long, white; and the appendix is $4\frac{1}{2}$ inches long, stout, cylindrical, acute, pale ochreous. *N. E. Brown, Herbarium, Kew.*

ZINGIBER BREVIFOLIUM, N. E. Brown, n. sp.

This is a dwarf Ginger, whose chief merit resides in the colour of the bracts of the flower-spike. It has been introduced from the Philippines by Mr. W. Bull, of Chelsea.

The plant is entirely glabrous and about a foot high. Stem destitute of leaves below, but with three to four obtuse, dull reddish sheaths on the basal part, leafy above the middle. Leaves few, three to five (or perhaps more in strong plants), with green stem, clasping or free sheaths, and sessile, oblong-lanceolate, or elliptic, acute blades $2\frac{1}{2}$ –4 inches long, $1\frac{1}{2}$ – $1\frac{3}{4}$ inch broad, base rounded, sometimes subacute, upper surface dark green, under surface greyish-green. Flower-spike sessile, terminal, fusiform, $2\frac{1}{2}$ –3 inches long, 7–8 lines broad. Bracts adpressed, oblong, retuse, with a small lanceolate rudimentary blade arising from the notch, or the upper ones simply acute, orange-yellow striped with red, two-flowered; inner bracts oblong-lanceolate, acute, three quarters of an inch long, 3–4 lines broad, membranous. Calyx membranous, spatheaceous, three-quarters to 1 inch long. Flowers yellow, corolla tube $\frac{1}{2}$ inch long, exserted, slender, curved above; petals linear-lanceolate acuminate, 8–9 lines long, the two lower ones connate to nearly half way up; lip 7–8 lines long, 3-lobed; lateral lobes falcate-oblong, obtuse; middle lobe lanceolate acute, twice as long as the lateral lobes. Anther with a curved beak 4 lines long.—*A native of the Philippine Islands. N. E. Brown, Herbarium, Kew.*

RENOVATING IMPOVERISHED CONIFERS.

NOTWITHSTANDING how greatly large specimen Conifers are prized by their owners, as well as by those in charge of the grounds in which they are planted, it is quite surprising that steps are not more frequently taken to preserve healthy trees in a vigorous growing condition, as likewise to reinvigorate those that show from their meagre appearance unmistakable signs of requiring it.

When we consider the case of specimen coniferous trees on the lawn as compared with that of trees planted in groups, the differences are great indeed—far greater than one would at first be inclined to believe.

In the first instance—that of single specimen trees—they are totally deprived of all the natural aids of enriching the ground in their immediate vicinity, such as are afforded by the decay of their leaves and fallen branches, accumulations of bird droppings, &c., all being swept clean away, while the very grass which impoverishes the soil beneath their shade is mown over closely, perhaps two or three times each season, and carried off wholesale.

Another disadvantage single trees have to contend with arises from their density of foliage causing even the heaviest showers to be thrown off almost beyond the reach of their rootlets, thus causing the soil beneath their shade to become dry, hard, and almost impervious, but more particularly is this the case with specimens growing in sheltered situations. On the other hand trees planted in groups have, in the majority of cases, the ground immediately around them annually enriched by the fallen *Abies*—dead twigs, branches, leaves, and underwood, all of which are allowed to remain unmolested, while the inter-lacing of their branches enables them to convey water almost direct to each other's boles.

New Garden Plants.

ALOCASIA GRANDIS, N. E. Brown, n. sp.

THIS is a very fine species, quite as ornamental as *A. Tibautii*, and more striking as to its inflorescence, the contrast between the blackish petioles and the large, handsome, white spathe being very effective. It has been recently introduced by Mr. W. Bull from one of the East Indian islands.

The whole plant is entirely glabrous. The petioles are 3– $3\frac{1}{2}$ feet long, proportionately stout, terete, and of a very dark blackish-green, or blackish-purple colour; as seen at a little distance they appear distinctly blackish, shining. The blade of the leaf is 20–24 inches long by about a foot broad, ovate-sagittate in outline, shortly cuspidate-acute at the apex; the basal lobes are about 6 inches long, broadly rhomboid ovate, very obtuse, and more or less overlapping, including a narrow acute sinus between them; the margin is slightly sinuate and undulate; the upper surface is of a uniform bright dark green, the under surface is blackish-green with purple midrib and nerves, which are slightly prominent and slightly convex above, very prominent and rounded beneath; the front lobe has about six distant, nearly straight, very spreading primary nerves on each side of the midrib; and each of the basal lobes have 2–3 stout nerves arising from the upper edge, and three finer nerves arising from the lower edge of the postical branch of the midrib, which is only very shortly denuded in the sinus. The scape is terete, about 2 inches long, and four lines thick, of a light reddish-purple below,

Placed at such a disadvantage it will be seen that single specimen trees must eventually suffer from one or other, perhaps both, of the above causes; and as it takes many years for the majority of Conifers to attain a size calculated to make them objects of interest, the best means of renovating impoverished specimens will now be briefly considered. Too frequently, perhaps, it happens that specimen Conifers are planted in well prepared holes of just sufficient size to contain the roots, the soil outside this confined space being hard, and, in many cases, poor and clayey, so that when the roots have exhausted their limited food supply, and begin to penetrate the hard and poorer outer crust, a check is instantly received that either induces an almost total suspension of growth or causes the annual development to be of the poorest and most meagre description.

TOP-DRESSING.

Under such circumstances timely top-dressings or the cutting of trenches around the trees, and substituting fresh loam for that taken out will set matters right and bring about that fresh healthy appearance that is so desirable a feature in specimen trees on the lawn, and other parts of the estate. Where top-dressing is to be resorted to, the best way is to remove the surface turf, and with a pick to gently ease the top soil for say 6 inches in depth, and in a circle around the stem equalling the spread of branches, substituting in its stead a compost of decayed vegetable refuse, well rotted manure, and good fibrous loam in equal proportions, this being raised to about 6 inches above the general level of the surrounding ground, or in all about 12 inches in depth, and laid over with the turf previously removed. In removing the old soil great care is necessary to avoid injuring the roots, and for this reason we have found that a fork (four-pronged) is preferable to the spade, and causes less damage in the furtherance of the work. A good watering should next be administered, and the turf bent firmly down with the back of a spade. To prevent the lower branches getting damaged or coming in the way of the workmen they may be tied up while work is going on, and released when finished.

We have examined the top-dressings given to coniferous trees in the above fashion after two years, and found the soil a complete network of rootlets even to within a few inches of the surface, thus showing the need they were in of such an application, and clearly pointing out the immense benefit of supplying the adequate amount of food for maintaining the trees in a healthy growing condition.

TRENCHING.

Trenches cut just outside the spread of branches and filled with fresh strong loam or the compost above recommended are, we find, even better and more immediate in effect, as well as lasting in their resources of food supply than top-dressings, probably owing to the greater depth at which they can be administered, as well as larger quantity that can be applied at a time. Dig the trench 30 inches wide and 2 feet deep, all roots touched upon being preserved as much as possible, and carefully relaid in the introduced compost with which the trench is completely filled. The compost used must, of course, depend upon circumstances, but should invariably be fairly rich and adapted to the special requirements of the trees operated upon. With very marked success we have used leaf-mould, road scrapings, and thoroughly decomposed manure in about like quantities, but either this or the compost above recommended will be found well fitted for the end in view. In five years after the first trench is taken out dig another immediately outside it, and substitute a similar mixture to that already described in lieu of the soil taken out. This may be thought as overdoing the work, but not so, for those who value their trees will certainly not begrudge this little outlay, particularly after they have once experienced the invigorating effects of such a course of treatment on poor, half-starved specimen Conifers. At what distance from the stem the trench or trenches should be cut must, to a great extent, depend on the size and species of trees to be operated upon. For close short-branched specimens, such as the Wellingtonia, Abies Nordmanniana, A. Pindrow, Cupressus Lawsoniana, C. torulosa, C. sempervirens, Araucaria imbricata, Cryptomeria japonica, C. elegans, Pinus Cembra, &c., the trench should be cut well outside the spread of branches; but in the case of those with wide spreading branches, like the Lebanon and Indian Cedars,

Cupressus Lambertiana, various species of Pinus, particularly P. excelsa, P. Strobus, and P. austriaca, Abies Douglasii, A. cephalonica, A. Webbiana, and several others, it may be made within the circle circumscribed by the branches.

It must be borne in mind we are here referring directly to trees that through poorness of the soil have become stunted in growth and meagre in appearance through an undue loss of foliage, for there are many soils and situations that suit these well and where neither top-dressings that suit these well and where neither top-dressings that suit these well will have to be resorted to.

DRAINAGE.

In conjunction with the application of rich compost to impoverished Conifers there is another trifling matter that is often neglected and to which we feel inclined just now to draw attention, that is, to the thorough drainage of pinetums, as likewise in the case of singly planted lawn specimens, and that particularly where the surface soil is largely composed of stiff unctuous clays. These surface drains should be shallow and wide, say 2 feet deep by 2 feet wide at top, and narrowed at bottom, with a good outlet. If neatly formed they need not mar the appearance of even well-kept grounds, although, when such work is executed close to the mansion buildings, it will be wise policy, and to the forester's own credit, to have tiles laid in the bottom, a few stones placed atop, and the remainder of the drain filled up with the previously removed soil, neatly turfed over.

By paying attention to the above important operations, and having them attended to in time, fewer, indeed, would be the ill-favoured, miserable-looking specimens of Coniferous trees with which one is frequently confronted, even in what are considered well-managed pinetums. *A. D. Webster, Penrhyn Castle, North Wales.*

FLORICULTURE IN THE UNITED STATES.*

LIKE nearly everything else in this fast age of the world, floriculture has made an astonishing advance in the past forty years, and when we look back we wonder why our operations in many things were so primitive and crude.

HEATING.

Forty years ago I doubt if on the whole continent there was in use for commercial purposes a greenhouse having a fixed roof; at least I have no remembrance of ever having seen one until about 1857, when the system was advocated by Peter B. Mead, in the *New York Horticulturist*. Previous to that time all greenhouse structures for commercial purposes were formed of portable sashes, and nearly all were constructed as "lean-to's," with high back walls, and none were connected—all were separate and detached—placed at all angles, without system or plan. Then the heating was nearly all done by horizontal smoke-flues, although here and there some private individuals, for their own use, made a crude attempt to heat by hot water as early as 1835; but the first use of heating by hot water on anything like a large scale was done in 1839, by Hitchens & Co., who heated a large conservatory for Mr. William Nible, of New York; and from that time until nearly twenty years after heating by hot-water was almost exclusively confined to greenhouses and graperies on private places, as few professional gardeners in those days could afford to indulge in such luxuries. All the work had to be done by smoke-flues, which, together with the greenhouse structures, were usually the work of their own hands.

Heating greenhouses by steam, to the best of my information, was unheard of in the United States at that date, though I am informed by Mr. Isaac Buchanan, of New York, that when he was employed in the Botanic Gardens of Edinburgh, Scotland, as early as 1830, the greenhouses there, which consisted of some 15,000 square feet of glass, were successfully heated by steam, but that later, for some reason, this method had been abandoned and hot water had been substituted. So it would appear the use of steam-heating with us to-day is, like many other things in human progress, but the revival of a lost art.

To give an instance of how excellent methods long in use have been abandoned and forgotten, I may mention that some fifteen years ago, when on a visit to Philadelphia, I called on our friend, W. K. Harris, who showed me where, with one fire, he successfully

heated a greenhouse, 20 x 100 feet, by the excellent plan of returning the flue so that the chimney was placed on top of the furnace. It was no doubt original with Mr. Harris, and I gave him the credit of the invention, which I described in the *American Agriculturist* of that date. But it had no sooner been printed than a gentleman in Salem, Mass., wrote me, saying that if I would refer to the *Transactions* of the London Horticultural Society for 1822 I should find the same plan there described; but, like many other valuable things, it had been lost sight of and forgotten, for there were few books and fewer magazines obtainable by the gardeners in those days.

In this country heating greenhouses by steam for commercial purposes was, I believe, first successfully practised by E. H. Bochman, in Pittsburgh, about 1875, but it is only in the past five years that its merits have been so fully proved.

Progress is slow in many things, mainly for the reason that publicity is not given to new ideas; hence the great value of such an Association as ours. It is somewhat singular that few, if any, of the large greenhouse establishments in England yet use steam; and it may be that we are yet to show them that it is not only much cheaper, but, I believe, also the best method of heating any greenhouse structure having 5000 square feet of glass.

PROPAGATION.

Not only has a great advance been made in the structure of greenhouses and their heating, but methods of propagating and growing plants have also been much improved upon. The propagator, forty years ago, for the few large establishments in the country, was generally imported from England, and was usually a most important personage—often full of mystery and overweening conceit, who guarded his knowledge, of which he had often not a very large stock, with a miser's hand. One of these gentlemen was a sort of autocrat in the greenhouse establishment of the late Robert Buis, when I worked there in 1844. He not only refused to impart any knowledge that he possessed on the subject, but actually locked the door of the propagating-house against all his employes; and he was sadly put out one day when a sarcastic wag tacked to the door the following transposition of Goldsmith's famous couplet:—

"And still we gaze, and still the wonder grows,
How one small head can carry all he knows."

We are glad to know that few of that ilk can get a foothold here to-day. The knowledge of propagating has now been so diffused by books and magazines devoted to floriculture, and the rules laid down are so simple, that all the mystery that was thrown around it in those early days has been dispelled. But every now and then, even now, we find some fellow arrogating to himself some "special secret" in our trade. There are no secrets in horticulture. The laws that govern the germination of a seed, the rooting of a cutting, or the taking of a bud or graft are the same now as they were a thousand years ago, and any one pretending to a "special" knowledge (unknown to others) in the matter is either an ignoramus or an impostor. Of course, experience or special advantages give a knowledge that the want of such cannot give. But the underlying principles never change, though undoubtedly in the methods of making them available we have made vast strides in this country, particularly in the matter of propagating, in the past twenty years. Whether we have made much advance in the classes of plants grown now, from what were grown forty years ago, there may be some question. Certain it is that there were many fine varieties of plants then grown which we fail to find to-day, particularly in the hard-wooded or New Holland section, such as *Heaths*, *Eparis*, *Correa*, *Pimeleas*, &c. Mr. Buis, of Philadelphia, and Mr. Hogg, of New York, over half a century ago, both had collections rich in these classes, together with nearly everything desirable in stove and greenhouse plants, but they gradually became diminished, as it was found that their culture was attended with special care in our hot and dry summers. Sales diminished in consequence, and their collections were allowed to run down, to be replaced by such plants as were found to be better adapted to our tropical summers.

CUT-FLOWERS.

But the most wonderful advance in floriculture has been in the arrangement of cut-flowers into bouquets

* "Floriculture in the United States during the past Forty Years," a paper read before the Society of American Florists, at the Annual Convention, held in Philadelphia, Pa., August 18, 19, and 20.

and other designs. Forty years ago, in New York, in constructing a simple hand bouquet, some of us did not know enough to use a thread to keep each flower in place as the construction went on, and it was some years later that the centre stick was used to steady the structure. The wire design man did not put in an appearance until nearly twenty years later, and when a cross or wreath of flowers had to be made, the cross was usually constructed with pieces of lath, on which the flowers were tied, and the floral wreath had the groundwork of a piece of old barrel hoop or a Willow twig. The bouquet was usually a one-sided affair, the groundwork being a flat bunch of Arbor-vitæ, through which the flowers were drawn. Occasionally a round bouquet was attempted by some artist of local fame, but with a result that must have done violence to the feelings of the poor flowers that were used in the structure.

The character of the flowers used for cut-flower purposes has also been radically changed. Forty years ago Camellia flowers were freely retained at 1 dol. each, and Philadelphia used to send thousands to New York florists at the holidays, getting 500 dols. per 1000; while Roses were then going a-begging at one-tenth of that sum. Now the Rose is queen indeed, and the poor Camellia finds none so poor as to do her homage. The culture of Tuberoses came a little later. I find, from an old schedule of prices, that in 1865 Tuberoses were quoted in November at 8 dols. per 100, and a reference to my own books shows that in that year my receipts from a house (10 x 100 feet) of Tuberoses were 1500 dols. in November; now they are rarely sold at all in New York, unless to the poorest class—Dame Fashion has stamped them out, as she, twenty years before, stamped out Camellia flowers; and just here comes the question, May there not be danger of a rebound in the Rose "boom"? May there not be danger ahead in placing so many eggs in one basket, fascinating though the basket be?

SALES.

The increase in the sales of all products of floriculture in the past forty years has certainly kept pace with most other industries, and has probably exceeded many. In January of 1844 I was employed by a New York florist, who did nearly the whole business of the city at that time. His sales of cut flowers for New Year's Day of that year footed up the sum of 200 dols. I have but little doubt that the aggregate sales of cut flowers in the city of New York on January 1, 1886, were not less than 100,000 dols., and the aggregate for the past year cannot be short of 3,000,000 dols., which is probably twice that of any European city of its size. An equal advance has been made in the output of plants. We have good reason to believe that Mr. William Elliott, the well-known horticultural auctioneer, of New York city, often sells more plants in two hours from his warehouses than were sold during a whole season by the florists of New York in 1844. I know that he repeatedly sells at one sale 50,000 plants; but it is exceedingly doubtful if that number was sold in New York during the whole year of 1844. The past season there were probably shipped and sold in the market and at auction not less than 50,000,000 of flowering and ornamental plants, of which perhaps one-tenth was sold at auction. The aggregate value of the sales can only be approximated, but I should think it safe to say that the average would be quite 5 cents apiece, or 2,500,000 dols. E. L. Taplin, a most careful writer, in an article in the January number of the *Floral Cabinet* for 1885, says:—

"According to the best information, there are over 8000 florists established in business in this country, who, with their workpeople, make a considerable showing in the population. The number of Americans engaging in the business increases yearly, for though England contributes the largest quota to the trade, with Germany and France following closely, Americans are now waking up to the possibilities of the business. Allowing 400 feet of glass-covered surface to each florist—a low estimate—this would give a total of 3,200,000 feet, or 630 acres of glass surface. Last year the trade sold 24,000,000 cut Roses and 120,000,000 Carnation flowers."

If the business increases in the same ratio for the next forty years rest assured the now somewhat humble florist will have a place in the community; that the increase will be even greater there is good reason to believe. In the early days of floriculture nearly all the men engaging in the business were old-countrymen who had been private gardeners, often

lacking in education and intelligence, and utterly untrained, from the nature of their occupation, in business habits. Now hundreds of young men, with better opportunities of education, are training direct for the business in all sections of the country; and I think it safe to predict that the leading florists forty years hence will be far better business men than even the most prominent among us now. And it may be that, when the Society of American Florists meets again in this good old city four decades hence, some other veteran, now a stripling here to-day, will tell, as I have done, of the primitive ways of the craft as practised "forty years ago." *Peter Henderson, in "The Ladies' Floral Cabinet."*

CONSERVATORY AND BALL-ROOM AT SANDRINGHAM.

The accompanying illustration (fig. 77) represents a structure erected last year for H. R. H. the Prince of Wales, at Sandringham House, Norfolk, by Messrs. Boulton & Paul, Norwich. Designed as a flower court, it forms a valuable addition to the large ball-room, and affords a means of communication between several of the principal rooms. The whole is carried out in a first-class manner. The heating apparatus is arranged under the iron gratings.

Orchid Notes and Cleanings.

ODONTOGLOSSUM ODORATUM, Lindl.

Mr. SANDER has observed that he has received from the late Arnold a Columbian plant, which by its slender virgulate panicles is well distinct from the southern *Odontoglossum odoratum* with very conferruminate dense branches, which sometimes form a nearly contiguous mass of flowers. It happens, however, that this fresh plant is the typical *Odontoglossum odoratum* itself, gathered at the very spot where the original plant was met with: Dr. Lindley's herbarium gives evidence of it. *H. G. Rehb. f.*

VANDA DENISONIANA HEBRAICA,

which forms an evergreen tuft, is quite new, having been introduced by us [B. S. Williams] a few years ago, and flowered for the first time this year. It resembles its parent, *V. Denisoniana*, in its growth, and attains the height of 3 feet, with perfect foliage, and when well grown is an unique plant. The spikes of its fragrant flowers are produced on each side of the stem from the axils of its copious leaves; the sepals and petals are sulphur-coloured on both sides, but darker within, where they are covered with numerous streaks and short transverse bars, forming marks somewhat resembling Hebrew characters; the spur is orange-coloured inside, and the front part of the blade of the lip pale sulphur-yellow. The blossoms are produced during the summer months, and continue in perfection for some time. We received it from Burnah.

We have grown this distinct variety in the East India Orchid-house with other Vandas, and find it succeeds well grown in pots with live sphagnum moss and good drainage, filling the pots three-parts full of broken pots, and placing the moss on the top, above which the plant is elevated about 3 inches. A few broken crocks mixed with the moss will be beneficial to the roots, as they help to keep the material open so that the superabundant water can pass away, for stagnant moisture is detrimental to these plants. They require, indeed, to be kept moist at the roots during the time of vigorous growth, which comes after the flowering season, but they are growing more or less during the whole year, even during winter, and at this time the moss should be kept rather moist, which prevents them from losing their bottom leaves, a misfortune which frequently occurs if the plants are kept dry, as they have no thick fleshy bulbs from which to draw support.

These Vandas are of easy cultivation if they get the treatment they require. We find no difficulty about this, as we always treat them alike, and grow them in the same house. They require shading from the hottest sun, but this should be done with very thin shading, as the plants like all the light possible. For this reason the blinds should never be kept down when the sun is on the decline, or during dull weather.

These plants are propagated by the young growths which spring from the base and sides of the stems; these should be left on until they make roots, and then be taken off with great care and potted in the same kind of material as recommended above for the parent plants. "*Orchid Album,*" August.

TRICHOPILOIA MARGINATA, Hofrey.

The original record of this distinct plant was confirmed by Professor Reichenbach last week from a specimen which flowered in the collection of R. J. Measures, Esq., at Cambridge Lodge, Camberwell, and thus the general impression in works of reference and in gardens, that it is identical with *Trichopilia coccinea*, is set aside. The plant was recently exhibited by Mr. Measures at the Royal Horticultural Society, and those who saw it will remember that in habit of growth and flower it seemed exactly intermediate between *T. tortilis* and *T. coccinea*, having the twisted green sepals and petals with reddish middle band and spots, and the lip much more expanded than that of *T. coccinea*; white with red blotches in the throat. The pseudobulbs and leaves are much shorter and stouter than those of *T. coccinea*, and more like those of *T. tortilis*. The species are very pretty and distinct, and need never be confounded with *T. coccinea* by those who know it. They must, however, take care not to confuse it with *T. crispa marginata*, which it resembles perhaps more than it does *T. coccinea*. *James O'Brien.*

CYLOGYNE DAYANA

is a plant of evergreen habit, and is furnished with long narrow—almost cylindrical—pseudobulbs, which bear dark green foliage. It produces its long pendulous inflorescence from the base of the pseudobulb, and bears about twenty-four flowers on each of its somewhat loose racemes. The sepals and petals are of a very light ochre-yellow, the lateral lobes of the lip being marked with numerous collateral longitudinal broad dark-coloured and white stripes, and the front lobe on the same light-coloured ground, bearing a crescent-shaped half ring of dark brown. This Bornean species blooms during summer and flowers in succession, all down the spike.

This species will thrive with the same treatment as *C. Massangeana*, that is, it may be grown either in a pot or in a basket suspended from the roof of the Orchid-house, using as a compost rough fibrous peat and sphagnum moss, and being careful to secure good drainage. A liberal supply of water must be given during the period of vigorous growth, and a smaller quantity during the season of rest. The plants are free in blooming if they are well cultivated and receive proper attention, which is simply to expose them to plenty of light, and to furnish them with good sweet material to grow in. They will do either in the East India-house or in the warmest part of the Cattleya-house, with a slight shading during the time the sun is powerful. The foliage frequently gets spoiled through having too much sun; a little of the early morning sun will not harm it, neither will it suffer after 4 o'clock in the afternoon, when the heat is on the decline; but the hot mid-day sun is more than it can bear. *Orchid Album.*

PERISTERIA BARKERII.

This species was sold at Messrs. Protheroe & Morris' rooms in July last year under the name of *Aciceta species*. I bought a plant which produced strong flower-spikes last month, and on comparing it with the plate in *Bot. Mag.*, t. 4203, I find it is the same plant that Mr. Ross sent to Mr. Barker, of Birmingham from Xalapa in Mexico. It is interesting to watch the development of the flower-spikes during a period of seven months, but when the great pendulous spike of rich yellow flowers are developed it is disappointing to find they last in beauty but three days only. *J. D.* "LINDENIA."

The following species and varieties are figured in the last number:—

Anguloa Kucheri, var. *media*, Rehb. f., t. 53.—One of the globular flowered Orchids, with flowers of the size of a medium sized Apple, segments yellow, thickly sprinkled with red dots, and with a red lip. Culture is easy, growth begins in February or March, when water should be freely supplied. After flowering the plants should be repotted, taking special care not to break the roots. The plants should be shaded. In potting the plants should be well raised on peat mixed with lumps of wood charcoal.

Spathoglottis plicata, l. 54.—Flowers racemose,

flat, five-rayed; segments ovate, rosy-lilac; lip smaller than the segments. The Compagnie Continentale has succeeded in raising some hybrids between *S. augustorum* fertilised by *S. plicata* and by *Calanthe vestita*.

Cattleya Mendelii, t. 55.—The Editors consider this, with reason, as a variety of *C. Trianae*.

Vanda Lindenii, Kchb. l., t. 56.—A native of New Guinea, nearly allied to *V. hastifera*. *Vandas* grow throughout the year, and having no pseudobulbs, require proportionately a more constant supply of moisture and a high temperature.

ÆRIDES ROHANIANA.

At p. 206 in the *Gardeners' Chronicle*, n.s., vol. xxi., Reichenbach truly describes this as a grand *Ærides*, although under the circumstances probably he was unable to detect all its properties. A fine specimen has been flowering for some time back in the East Indian-house at Kew, and proves to be not

with the same potting material and the same cultural treatment accorded other East Indian and Asiatic species. *♀. P.*

ORCHIDS IN FLOWER AT MESSRS. LOW'S, CLAPTON.

Of *Oncidium bicolor* there is a very large importation, the plants as well as the flowers reminding one of *O. bifolium*. A few of them are in flower, and very lovely they are—the lip of a clear yellow on the upper surface. We shall be glad of a good supply of this species, as it is evidently September flowering. There is an excellent plate of it in the *Botanical Register*, t. 66. Dr. Lindley there wrote of it as "This charming species of *Oncidium*, one of the rarest of its genus, was obtained by Messrs. Loddiges from the Spanish Main. It flowered with them in September, 1842." *O. bicallosum* is also in flower; it is of the *O. Cavendishianum* type, but is quite distinct from it, and ranks as a species. It was sent

yet, although there is a pretty spike of *P. Esmeralda*; *P. Sanderiana* and *P. violacea* are also in flower. The plants in this house are remarkable for their vigorous growth. The Ladies' Slippers are represented by *Cypripedium Spicerianum*, and the *Cœlogynes* by the lovely little *C. ocellata*; its pure white flowers with orange-coloured spots on the lip are very striking, and cannot fail to please. *♀. D.*

CATTELEYA BICOLOR WRIGLEYANA.

This beautiful form is at the present time flowering very freely with us here. Though it cannot be compared with the larger and more showy flowers of the *Mossie* and *labiata* sections, it nevertheless has a special and peculiar beauty of its own.

I forward a spike of seven flowers, which I have just cut. This number is the highest we have reached, and as we have several of this number out of fifty spikes now in flower we are anxious you should have an idea what this variety is when at its

FIG. 77.—FLOWER COURT ERECTED AT SANDRINGHAM FOR H.R.H. THE PRINCE OF WALES, BY MESSRS. BOULTON AND PAUL. (SEE P. 392.)

only distinct and handsome, but deliciously fragrant when in full flower and before it is too far gone. The odour resembles as nearly as possible that of dried Cinnamon bark, and few people would dislike it. It is another of the many instances of the great variety of odours within the limits of a single genus. The densely flowered and thick cylindrical inflorescence droops or is suspended in a graceful manner from the end of the horizontal peduncle. The distinctness in colour lies in the delicate blending of various hues, none of which are dark or exhibit any glaring contrast. Although little stress is laid upon colour for botanical distinction yet from a horticultural point of view it is a matter of the greatest importance, and at the hands of the gardener receives the first consideration. The sepals and petals are delicate rosy-lilac on a white ground, or, as elsewhere described, rose-mauve with a white border; while the lateral segments of the labellum are pale yellow, with a few faint purp' spots towards the base, and the middle segment white, or nearly so, with a few faint purple spots towards the apex. The spur is greenish-yellow, mottled with purple. It seems to be perfectly at home in a basket hung up near the light,

in the first place from Guatemala by the late Mr. Skinner. Mr. Bateman flowered it in 1842 from which it was figured in the *Botanical Register*. It is also figured in the *Botanical Magazine*, t. 4148. There are evidently two varieties, one with more of an orange colour in the sepals and petals, and the other paler, as in the *Botanical Magazine*. Both varieties are in flower at Messrs. Low's. It is much superior to *O. Cavendishianum*, the flowers being much larger. *Cattleya Harrisianum* forms a nice flowering group in one house; some varieties are much paler than others; the darkest have rosy-purple sepals and petals, the lip creamy, with an orange band in the centre. *Laelia Dayana* and *Cattleya Gaskelliana* are in flower; the first named should be in every collection, its rich maroon-purple reflexed lip is very striking; it does well near the glass in a basket. *C. Gaskelliana* has quite usurped the position so long held by the autumn-flowering *C. labiata*. The finest form of it I have seen is now in flower here; the sepals and petals are a lovely rose colour, with a richly coloured lip like *C. Warneri*; usually the lip is very pale.

In the *Phalenopsis*-house the time of flowers is not

best. It is a great advance in size and colour upon the original form—the sepals and petals being a pale green, with a yellow shade, this latter colour more distinct along the edges. The lip is of an intense rosy-purple, the column of the variety sent being pure white. The plants are grown in pots in peat, with just a bit of moss, plenty of charcoal being used in the crocking. We have new groups 2 feet to 2 feet 6 inches long this season, in many instances longer than the imported buds. The plants have had much more light and heat than is usually given to *Cattleyas*. *W. Swan, The Gardens, Howick House, Preston.*

HYBRID PLUMS.—M. Carrière has been experimenting by crossing *Prunus japonica* and *P. susquehana*, the latter a form of *P. pennsylv.* Among other results he has obtained a curious form, which he calls *P. hybrida reptans*, characterised by the production of long loosely arranged branches spreading on the surface of the ground. The flowers are small, white, and produced in May. The singular habit of this plant should render it desirable for large rockeries. M. Carrière suggests that it should be propagated by layers.

MARKET PLANTS.

ONE of the leading market nurseries, of which there are now so many round London, has recently been purchased by Mr. Sweet at Whetstone. It consists of some 17 acres, with a large extent of glass devoted to the growth of Camellias, Grapes, Tomatos, Cucumbers, and several of the kinds of plants that are in demand in Covent Garden Market.

The stock of Camellias is very large, filling several houses. One house, span-roofed, is 100 feet long by 24 wide; two rows occupy the space; they are big dense bushes, all planted out. Much the greater portion of the stock consists of the old double white variety, of which there is probably twenty times as many sold in the market as of all the other kinds put together. The largest plant of this variety has a house to itself, which it fills, and will shortly have to be made bigger, as the plant has reached the top, and the branches have extended so that there is insufficient room to get round it. The diameter of the plant is 18 feet, the height nearly as much. Eight or ten years ago account was taken of the number of flowers gathered from it in one season, which was 7000; since then the number has reached as much as 10,000, after a still greater quantity have been thinned from it. The largest house devoted to Camellias is composed of three spans some 65 feet long by 60 wide. The plants here again are all large and are turned out in spaces enclosed with 4½ inches of brickwork.

The vineries now in bearing consist of a number of large houses, mostly span-roofed; one of these, 185 feet long by 23 wide, is filled with Black Alicante carrying a very fine crop of medium sized bunches, the berries larger than usual, met with. The Vines are planted on both sides of the house, and are confined to one row each. By the side of this is another house, similar in size, occupied by Lady Downe's, like the last planted on both sides. On one side the crop is all that could be desired, on the other there has been some scalding. Another long span, similar to those described but with a division in the middle, contains Black Hamburghs. In one division the crop is a very good one, in the other the bunches are small.

Here may be seen the danger of using paraffin. Mr. Sweet finding that the Vines in this division were affected with mealy-bug had them dressed with Gishurst and Fir-tree oil added to the usual mixture of soft-soap, sulphur, and clay. Soon after they came into flower it was seen that the buds were not all killed on the old wood, which was then dressed with equal parts of paraffin and sperm oil, which had no apparent effect on the growth, except that the young wood seemed to swell faster than usual, and that the bunches were smaller, though the berries have swollen, and are ripening right. The wood is in a most singular condition, the lower part of the shoots, and for some length above, being quite green, and without any sign of its ripening, whilst above from where the bunches hang it is brown and ripe. This is a state the like of which I have not seen or heard of before. It will be interesting to see how these Vines behave next year, and whether they will show a crop from this green-looking wood.

Two spans, each 185 feet long by 25 feet wide, that Mr. Sweet has rebuilt and planted with Gros Colmar Vines, are now filled with Tomatos. These are in rows right and left across the houses, leaving a passage down the middle. The arrangement of the planting that is found to give the most fruit is to have four rows 18 inches apart, and then a space of 2 feet so as to be able to get amongst the plants to thin and water them, and to gather the fruit. Another span-roofed vinery, 200 feet long and 25 feet wide, is principally occupied by Black Hamburghs, carrying a fine crop of well finished bunches, black, and nicely covered with bloom. Near this are two more span-houses, each 120 feet long, both filled with Gros Colmar, carrying a full crop of moderate sized bunches, which the market buyers like much better than large ones. They were colouring with every prospect of their finishing up well. These and the various houses of Black Alicante and Lady Downe's will be kept for sale in winter.

Another long house that has been recently planted with Black Hamburghs is filled with Tomatos. Still another house, a lean-to of considerable length, is occupied by Tomatos, the latest crop; the plants are remarkably strong, and promise to keep on bearing late. As much as 3000 lbs. of Tomatos per week have been sold. Italian Red and Trophy

are the varieties grown; the first-named does best early in the season, but the last answers better later on, and being smoother and of a more equal size is in more favour with buyers. Some long beds out-of-doors have done remarkably well this season, and were still full of fine fruit ripening fast when I saw them at the beginning of September. Tomatos seem to be less affected by competition with foreign produce than other things; those of foreign growth are not only flavourless through being gathered so long before they are ripe, but they contain such quantities of seed that few of those who have compared them with good home-grown Tomatos care to have them, however tempting the price may be.

Another vinery contains Gros Colmar, somewhat earlier than those already named. The next vinery in bearing is a span about 100 feet long by 24 feet wide—all Lady Downe's, carrying plenty of bunches, but the crop has suffered a good deal through scalding, although there was no deficiency of air kept on during the critical time when this variety is so liable to be affected in this way. A roomy, hip-roofed house, standing at the northern extremity of the nursery, contains Gros Colmar planted about three years, and now carrying an even lot of bunches. Two more span-roofed houses in front of this have been planted this season with Black Alicante, which is a favourite with Mr. Sweet, and deservedly so, for as a winter Grape taking into account its fine appearance, and the immense weight of fruit which it is capable of finishing up perfect in colour, there are not many kinds that will beat it for marketing. Cucumbers in very large quantities are grown in the early part of the season.

A number of long houses are filled with plants of various kinds, including Cinerarias, which are grown in quantity, and also double white Primulas, with Paelegonias of the usual fine early flowering varieties. Of the berry-bearing Solanums there are also large numbers. A tree is being got up of the double yellow Marguerite (*Chrysanthemum frutescens*), which at one time buyers would not look at, but now it seems to be much in favour.

Winter flowering Heaths are very well done, quantities of these standing out-of-doors were beautifully set with bloom and in excellent condition every way. A batch of E. Cavendishii have made good growth, and promise to flower well. This beautiful Heath has only recently been brought into requisition as a market plant, but managed as it is now is by a few of the growers, in small pots; the plants covered from the tops of the shoots down to the pots with their bright yellow flowers, it is very attractive. Not the least of the merits it possesses is that it keeps fresh so long in flower.

Celosia pyramidalis is another plant done well here; it is grown, like most things that are intended for market, in small pots. The strain is a remarkably good one; the plants are stout and bushy, and the colours bright and vivid, ranging from the deepest crimson to pale pink and yellow.

Something like an acre of Chrysanthemums are grown in pots for the production of cut flowers; they are strong, bushy plants, calculated to yield an immense quantity of bloom. They go to fill the various houses that are cleared from Cucumbers and the earlier crops of Tomatos. The varieties grown are the usual kinds that keep up a supply from autumn to the beginning of the new year. A large extent of ground is covered with bush fruits and Plums, the latter of which this year, here as in other places, are unfortunately scarcely worth gathering.

In the numerous houses that Mr. Sweet has rebuilt Payne's patent ventilating gear is used. It is the best of the many contrivances that I have met with, inasmuch as it is simple, and there is no strain on the ironwork or the lights and shutters it is employed in opening. This may be understood from the fact that the hinged roof lights in houses 200 or 300 feet long can be opened at once the entire length. Ordinary 1-inch or 1½-inch gas piping is used for the bar running the length of the roof, and on which the executive levers that raise the lights are attached. All wrenching and straining is avoided by the use of weighted rods attached at intervals to the opening bar on the same principle that the railway signals are weighted. These are so arranged that they nearly balance the lights to be raised. The simplicity of this is such that a child can work it.

In one of the long span-roofed houses here there is an example of one of the number of what may be

termed curiosities in glazing that was to have superseded the use of putty, and which not a few of those wanting in experience or caution have been led to try with the usual result, that the mistake is discovered when enough time to test the system has elapsed. The house in question is to be reglazed, and putty, that has so often by some been supposed about to be done away with, used.

Mr. Sweet still keeps on his other place at Leytonstone, where, amongst other things, Grape growing on an extensive scale has been long and successfully carried out. T. B.

The Rosery.

ROSE MADAME GABRIEL LUIZET.

THERE has been a good deal of contention over this Rose, as to whether it deserves to be called a hybrid perpetual or not. All along I have maintained that it is so, but even this year I have met rosarians of far more experience than myself who maintained that it must be classed amongst summer Roses. I have, therefore, been unusually gratified to find that the bushes which have been most covered with bloom in my small Rose garden have been those of this very charming variety. Every shoot has three or four buds upon it, and although these have to be thinned out in order to get larger blooms, yet I can safely say they are as full of bloom as they were in the height of the Rose season. This is very satisfactory, for when I have praised the flower for the exquisite beauty of its colour the reply has generally been—"Oh! yes, very pretty, but it is a pity that it is not a perpetual bloomer." There are Roses which at once by their habit of growth proclaim their unperpetual character. I have one of last year's which showed this at once, but where it is not the case, and the wood gives promise of its being a perpetual character, it is well not to pronounce a verdict upon it for a couple of seasons. How many, for instance, of those Roses which are usually considered hybrids have not given a bloom this autumn, notwithstanding that it has been a good season as far as my experience goes—a very good one for second blooming. I therefore hope that the slur which has been cast on the fair fame of this lovely nymphet may be removed, and that she may be considered "good in autumn."

The hot weather we have experienced in the early part of the month (September) has been very favourable for the autumn flowering of Roses where mildew has not been excessive, but this has in some cases been very bad, the great alternations of temperature being very favourable to its development. We have found out this in our Hops, a large quantity of which have been affected by mould, so that the fruit has been undeveloped and the bines not worth picking. The same effect is produced amongst Roses; the buds become mildewed, and, if they open at all, are poor, and quite out of character; good blooms are, however, to be found now, and especially amongst those where there is a preponderance of Tea blood. Captain Christy, La France, and such-like Roses, are pretty sure to be good autumnal bloomers, so is Baroese Rothschild, while many are uncertain, and only treat us now and then to a good bloom.

But, after all, the Tea Roses are the most satisfactory of all for this purpose, and I am not at all surprised at their increasing popularity. What lovely blooms of Anna Olivier, Marie Van Houtte, Madame Lamiral, Rubens, and many others one can get all through this month, where anything like care has been bestowed upon them; what vigorous shoots they throw up from the ground where they are either budded low or on their own roots. Some of the later varieties are deeper in colour, and will be appreciated by those who do not think that they interfere with the delicate form, the elegance and refinement of the Tea Rose. Such flowers as Madame Cusin and Madame de Watteville are sufficiently delicate in their colouring, but Souvenir de Thérèse Levet is by far the highest coloured of them all. Then, to those who wish for such flowers, there are the hybrid Teas, such as Chesham Hybrid, Reine Marie Henriette, and, if we may believe report, especially American Beauty. This, which was raised in the garden of Mr. Bancroft, the historian, is said to be as large as Paul Nevon, combining the ever-blooming qualities of the Tea Rose with the fragrance

of the damask; colour rosy-red—so says Mr. Boyson, of Caen.

Madame Gabriel Luiza has led me into a diving-path, but I could not resist writing a few words about these favourite flowers. *Willd. Resc.*

NOVA SCOTIA APPLES.

The Apple crop, which is one of growing importance, promises to be very satisfactory. The two counties chiefly devoted to this industry for the supply of the English market, are King's and Annapolis. In the former there will be nearly an average crop; but in Annapolis there is appearance of an unusually full crop of fine quality—the most promising market sorts being apparently Baldwin, Northern Spy, Gravenstein, Nonpareil, Golden Russet, Rhode Island Greening, and Ribston Pippin. In those two counties there has not been so much extension of the orchard area as in some former years, but more attention is paid to culture, so as to produce the best possible quality of fruit. In some others, however, not hitherto recognised as fruit counties, the formation of orchards is progressing in a vigorous manner.

It is well known to fruit growers that certain varieties bear full crops only every alternate year; other circumstances affect the crop, so that, even in a favourable year there may be a small crop of some kinds and a large crop of others. The indications of the following returns are, that there will be a rather poor showing of Yellow Bellefleur, which, of late years, has been on the decline; that King of Tomkin's County is also decidedly under average; that the Baldwin and Northern Spy will give over an average crop of fine quality; Gravenstein and Nonpareil abundant crops of exceptionally fine quality; Golden Russet decidedly good; Rhode Island Greening above average, and Ribston Pippin a fair average.

EARLY AUTUMN FRUIT SENT TO COLONIAL AND INDIAN EXHIBITION.

Arrangements having been made to supplement, by fresh samples, the permanent exhibit of Nova Scotian fruit at the Colonial and Indian Exhibition, a first shipment for this purpose was made at Halifax, per s.s. *Uluda*, for London, on August 14. It consisted of the following varieties:—

<i>Apples.</i>	
Early Harvest	Fruit of Old-naw
Sutton's Ezey	Transparent Moscow
Early Pough	Williams' Early
Early Red Margaret	Alford's Red
Red Astrachan	Gravenstein
Early Joe	Alexander
Petricky	Chesnut Beauty
<i>Plums.</i>	
Nectarine Plum	Early Clivia
Hamilton	
<i>Peaches, Grown in the Open Air.</i>	
Alexander	
<i>Pears.</i>	
Clapp's Favourite	Osborn's Summer
Maria	Reister
Jessamine	Doyen d'Été
Helbrock	

A second shipment of Nova Scotian fruit to the London Exhibition was made at Halifax on August 30, per s.s. *Nova Scotia*, for Liverpool. It consisted of the following kinds, and will be followed by other shipments as the later varieties ripen:—

<i>Apples.</i>	
Early Williams	Black Doctor
Early Joe	Chesnut Beauty
Red Astrachan	Alford's
Early Pough	Ohio Nonpareil
Primate	De Roca
Duchess of Oldenburg	Drapp d'Or
Chenango Strawberry	Gravenstein
Early Red Margaret	Maiden's Blush
Sutton's Early	Calkin's Pippin
Fourth of July	Porter
Allison's Early Red	Early River
Washington Strawberry	Munson's Sweet
White Astrachan or Transparent de Moscow	Perry's White
Fall Genetling	Golden's Sweet
Early Calkin	Eye
St. Lawrence	Sweet Russet
<i>Plums.</i>	
Maria's Arctic	Green Gage
Clingstone Damson	Yellow Gage
Smith's Orleans	Jefferson
Washington	Goldmine Gage
Prince of Wales	Imperial Gage
Hamilton	
<i>Pears.</i>	
Clapp's Favourite	Earlett
Maria	Osborn's Summer
Southern du Congrès	Burdick
Italo deval	Rosé de
Brandywine	Pyrie's Early

George Lawson, Office for Agriculture, Halifax, Government of Nova Scotia, September.

BOTANIC GARDEN, CAMBRIDGE.

PERHAPS the most interesting plant now in flower is *Capparis spinosa*, which yields the Caper of commerce. The dark green roundish leaves combine with large white-petalled flowers to produce a pretty effect, of which few know the plant to be capable. It requires rather a special treatment, a brief account of which, with an illustration, will shortly be given. A specimen of *Gunnera manicata*, planted on the margin of the pond, has this year reached magnificent proportions, which much exceed those given by Mr. Baker in his account published in your issue of July 3, where he describes Sir George Macleay's specimen as having leaf-blades 4 feet in diameter, and quotes Libon's statement that the leaf attains a circumference of 5 metres. The largest leaf is 6½ feet in diameter, while the circumference given by Libon would indicate a diameter of about 5 feet 2½ inches. This specimen has twenty leaves, and is 13 feet 6 inches across. It is planted about 15 inches above the level of the water, and appears to enjoy the position. Under similar conditions, in the bog garden, *Saxifraga peltata* is also very large. It is 6 feet across, and the leaves, which are very numerous, are about 15 inches in diameter. On the borders two uncommon annuals have for some time been very pretty. The one is *Heliphila pilosa*, a Crucifer, rather less than a foot high, with flowers bright blue, tending, perhaps, a little towards violet. It is a charming plant. The other annual referred to is *Chrysanthemum multicaule*, of very compact habit, a foot high, producing innumerable golden flower-heads rather more than an inch over. It blooms profusely for a long time, and has been spoken of as suitable for bedding purposes.

In the houses *Nelumbium luteum* has again flowered in about the same strength as before. *Viola peritropa* (*V. gongyloides*) is now flowering freely, and the mistake of supposing the petals to fall cohering to a cap is clearly evident. They invariably reflex for some time before falling off. As the aerial tubers of this species are so remarkable, some have been kept quite dry for the purpose of observing how long they would retain their vitality, with the result that they are found to grow after three years keeping, failing the fourth year. *Eichornia azurea*, now well known as a handsome stove aquatic, has lately flowered effectively in a tub—the only means here of growing such a plant; it was figured in these columns, p. 17, January 2, of this year. The magnificent North American *Ibiscus*, *H. Moscheutos* and *H. rosea*, which, though hardy, do not flower out-of-doors, have this season flowered in a house of about intermediate temperature, where they have been so effective as to indicate considerable value for conservatory decoration. These species flower the second year from seed, and as they are rarely seen, attention may well be directed to them. Both have rose-colored flowers of immense size. The Mahogany tree, (*Swietenia Mahogany*) it may be well to note, has flowered this year, as in cultivation it is not supposed to do so. It may be the result of starving, which was tried to induce the production of flowers. They are so small as to be quite inconspicuous, and being green are not easily seen among the leaves. *R. from Lynch*

TREES AND SHRUBS.

BERBERIS VULGARIS.
THIS is a most attractive shrub at this season of the year, being literally covered with its sprays of pink fruit. It is alike suitable as a single specimen on turf in a shrubbery, or amongst a collection of other shrubs; but being of a drooping habit, it shows to better advantage as a single specimen on turf where space can be afforded it.

COTONEASTER FRIGIDA.
THIS is also another very useful berry-bearing shrub, which is now in its full beauty, being loaded with its large scarlet berries. I do not think it is so generally cultivated as it deserves to be, as it is seldom met with. *E. Ward, Huxell Gardens, Bromsgrove.*

THE MYRODELLA OR CHERRY PLUM AS A FENCING PLANT.

About forty years ago the Mr. J. W. Ewing, of Norwich, introduced into Norfolk and advocated it

use of *Prunus Myrobalana* as a plant with which to form fences. It is claimed for it that it will grow in almost all soils, but especially those of a light sandy or dry stony nature, where *Whitehorn* will barely exist, and for filling up gaps in old *Whitehorn* fences when the soil has become exhausted for the growth of *Whitehorn*; and it also grows well in boggy soils. But it is necessary to protect it from cattle for the first two or three years of its growth; and it should be kept clear of weeds.

GRAPES.

SEVERAL kinds of Grapes were shown at recent exhibitions at the Royal Horticultural Society, and at the Crystal Palace, in remarkably good condition, the best of both black and white being well represented. Among blacks, the finest bloom and finish was apparent in the Alnwick Seedlings as staged by several growers; this Grape has been abused, but will, we think, hold its own for years to come, being, when well ripened, a worthy successor to the late Black Hamburgs. It requires severely thinning when the bunches have set well, the advantage in respect of which was obvious in the 2d prize lot at Kensington in comparison with those which gained the 1st prize, the latter being much packed although very handsome bunches with a dense bloom. It succeeds well in either the Muscat-house or with Lady Downe's in the late vinery. *Gros Muroc* has come well to the front of late; it was hardly so well finished this year as last, but still grand in berry, and some fine bunches too were staged. This is a free setting kind, also requiring to be thinned very freely in order to allow its berries room for development. Small bunches (to all appearance) of this Grape, when in its earlier stages, grow up and form handsome clusters. It does well with Hamburgs, and forms a good succession thereto, but wants as much room as Muscates to develop its foliage.

Gros Colmar is not seen at autumn shows so much as it was a few years back. Unless grown with Muscates it cannot be ripened in time, being, in fact, a winter Grape, at its best from Christmas onwards throughout January, and does not compare favourably with either of the aforementioned kinds for autumn use.

Madresfield Court was not represented by such good examples at either show as we have seen; the finest bunches shown required another good thinning to show up the proper character of the Grape, which was far more apparent in neat bunches that did not obtain recognition. When the thinning of this Grape is finished the best way is to go over the bunches and thin them again, never fearing its peculiarity of cracking. This failing we have always found to be either entirely prevented or reduced to a minimum by free ventilation when commencing to colour. The most limited collection should include at least one Vine of this finely flavoured and handsome Grape.

Alicante, a deservedly popular kind, easily managed, and invariably finished well, was again shown in first-rate order. It seems, however, a pity to see such fine bunches cut so soon in the autumn, whilst Black Hamburgs and Madresfield Courts are in good condition, and the Alicante itself, with few exceptions not having attained to its peculiar flavour.

Black Hamburgs were seen better earlier in the season than shown at either exhibition; still some good examples were staged. It is frequently remarked that Hamburgs are not shown of good colour. Some allowance must, however, be made in this case when any comparison is made between this and other black kinds that carry such an intense bloom, beyond that attained with rare exceptions by the Hamburgs. Then, again, since the introduction of newer kinds, in many cases without doubt the Hamburgs have been subjected to a higher temperature than is safe for them wherein to finish well. For some weeks to come it should be the most sought after of any black kind for consumption.

Lady Downe's Seedling was shown in splendid order at the Kensington exhibition, indeed it was one of the most attractive classes on the whole of any individual kind, and the majority well finished. As in the case of Alicantes, it seemed a pity to see such fine fruit cut now, when three months more, at the least, should be allowed to elapse before they are included in any dessert.

The condition in which Mrs. Pince was shown did not speak highly for the kind, only one or two lots

being presentable; neither can much be said for Gros Guillaume or Black Prince, in fact it is doubtful if the two latter kinds are worth the room they occupy in any vinery.

Want of finish was the prevailing characteristic of Muscat Hamburgs; this somewhat fickle kind, although of fine flavour, does not appear to get just the treatment it needs to bring it out in first-rate condition.

We did not notice that finely flavoured autumn Grape, West's St. Peter's. It is worth a place in any late vinery, even if only for the use of invalids, by reason of its refreshing and melting character. It is the "invalid's Grape" after the Black Hamburgs are used up.

Of white Grapes Muscat of Alexandria is pre-eminently the best of its class. Shown we think on the whole even better than usual this season, there seemed to be an absence of loose bunches with traces

coloured examples were, however, the most attractive on the whole, and more in character with the kind.

Duke of Buccleuch was shown by his raiser with berries of enormous size and presented a grand appearance. In its class, however, its cultivation does not seem to be better understood than a few years back; the North Country growers seem to succeed better with it than we do in the South. Neither White Tokay nor Trebbiano are worth the room they take up when compared with the aforementioned kinds, having only size of bunch to recommend them.

Golden Queen, when well-finished, is a handsome Grape, but this rarely is the case. The better use to make of it, where it is still being grown, is as a stock for a better kind, it is a robust grower, and as such is well fitted for this purpose. Compared with Foster's Seedling it is beaten for early work, whilst for later use it is simply nowhere.

We would, in conclusion, like to inquire if there is

Paris, under the personal supervision of Mr. André, in whose office our young countryman is now studying.

The site of the park, which occupies 100 acres, is in the best quarter of a large town, and the land surrounding it on two sides, Mr. Jackman has judiciously marked out in suitable sized plots for gentlemen's residences. On another side a terrace and crescent is marked out for good houses, with a public garden in front of each, which will be planted with flowering plants and shrubs and choice Conifers.

The whole of the park is surrounded by wide avenues, and the park entrances are placed in the most convenient positions for easy access from the streets, with an ornamental lodge to each (25), which gives a pleasing and useful appearance to the park.

The style which Mr. Jackman has adopted is a natural undulating surface, as being the most picturesque, and also harmonising best with the surrounding country, and when carried out gives a much

FIG. 78.—PLAN OF A PUBLIC PARK.

of imperfect fertilisation. Solid and lumpy bunches were staged at both shows, and of that rich amber colour so much sought after yet not attained unto even by good growers in some instances. A few green examples were seen, but they were the exception. When will exhibitors of Grapes learn to leave their produce at home when not of good colour for the respective kind?

Next in point of place we would name Foster's Seedling, some remarkably clean and clear examples being shown. It may fairly be termed every one's white Grape, by reason of its hardy constitution and good bearing qualities.

Buckland Sweetwater did not come to the front so strongly in our opinion as the former kind. It is very taking when well done, but more often than not it is shown in a condition far past its best.

Mrs. Pearson is a white Grape worthy of more extended cultivation, its fine appearance and rich Frontignan flavour should recommend it. The large ungainly bunches at Kensington seemed to find most favour with the judges; the smaller and more highly

any difference between Gros Maroc and Cooper's Black. They appear to be one and the same thing; if so, the sooner the latter name is dropped the better. *Vitis*.

LANDSCAPE GARDENING.

THOSE who visited the great provincial show at Liverpool must have noticed among other exhibits a plan for laying out a public park of 100 acres (fig. 78), designed by Mr. A. G. Jackman, landscape gardener, of Woking, which obtained the highest award.

The design contains many high qualities, and displays throughout that good taste which Mr. Jackman has acquired during the time he studied the profession at the establishment of Mr. Shaw at Manchester, Mr. Pyoart at Ghent, and Mr. André at Paris, the latter gentleman being well known in England as the designer of Sefton Park, Liverpool, and other large gardens.

The plan was elaborated by Mr. A. G. Jackman in

more varied appearance to the park's or garden than any other style, and makes them also seem much larger than they are.

The site chosen for the park is undulating, and consists principally of meadows and grass fields, except on the west side, where there is a wood with a stream rising out of it, and flowing down through the grounds, which Mr. Jackman has taken advantage of, and converted into two ornamental lakes, which form the most important feature in the park.

The large lake (1) for boating and skating is fine, with its two well planted islands, and the pavilions and summer-houses placed in the most prominent places for obtaining views over the different parts of the park. The smaller lake (2) for birds, &c., is also very beautiful, with its waterfalls and rockwork (17, 18) in different parts, on which several varieties of alpine and aquatic plants can be grown. Both lakes are fed by a constant supply of water from the stream, at the head of which is a magnificent cascade (16), which, being in the wood, gives it a very natural appearance. A few walks with rustic bridges (13) across the stream have been made so as to get good views of the waterfalls, rockwork, and other scenery round the lakes.

The wood Mr. Jackman has retained, but he has also improved it by opening a few large spaces to obtain vistas, which spaces he intends to be used for archery or other amusements.

Several small plantations of Firs and forest trees have been made in different places of the park, so as to harmonise with the above mentioned part, and to vary the scenery. All the shrubberies are raised, and are so arranged as not to interfere with the views.

Another feature is the large open grass spaces (1, 3, 4, 5, 6, 8) for cricket and football, which may also be used for exhibitions and for volunteer grounds. The raised band pavilion (19), and also the refreshment pavilion (20), are conveniently placed, with large trees planted round them, with seats (24) underneath for shade and shelter, and to enable people to enjoy the music and games, and take refreshments. The other spaces for lawn-tennis, croquet, &c., are well designed, and are distributed over the whole of the park. A fine bowling-green (7), is also formed, and is placed in a suitable position, with every convenience. The boys' and girls' playgrounds (9, 10) or gymnasia are also a good introduction.

The flower garden (11), with large fountain in the centre (12), and statuary placed in different parts, is very pretty, and should be one of the most interesting

neighbourhood. When the cutting was obtained the girl made a hole in the ground with a poker, and in it the slip was planted. The soil is very rich about the district, and Roses are generally to be seen on the Manx cottage walls at Christmas time. *Geo. P.*

THE SEED HARVEST.

So far as returns have come to hand, relating both to actual and probable realisations, it would appear that the seed harvest all round will be a decidedly good one, but much will depend upon the character of the weather during the next fortnight. That the present season has so far proved favourable to the maturation and harvesting of the seed crops there can be no doubt; and growers are earnestly hoping that the prevailing bright sunny weather with a drying atmosphere may continue, so that the late crops (owing to a retarding spring, later in ripening than usual) may be harvested in as good condition as the early ones.

Peas, generally, are well secured, and are reported to be of excellent quality, with only a few exceptions,

Lettuce, and Leek, also require a continuance of drying, ripening weather to ensure good growing quality in the seeds; and growers have to be constantly on the watch to reap at the right time, or much that is promising might be destroyed.

It will thus be seen how much depends upon a fine dry autumn, and especially after so a late spring. The grower and seedsman alike have their anxieties; and both are anxious their customers should have the best they can supply—seeds plump, of good growing power, and, as far as human means can compass this end—of the highest quality. But very much depends upon Nature being in a mood to yield to man in the highest form "the kindly fruits of earth."

Titum.

FRUIT NOTES.

PEACHES: ALEXANDER AND AMSDEN.

It is just possible that Mr. Markham may not have the above true, and that only one variety has been

FIG. 79.—A FUCHSIA IN THE ISLE OF MAN.

features in the park. Flower beds are also placed in several parts of the park, and give it a very bright appearance, and help to liven the shrubberies up greatly.

As no park can be considered complete without the usual means of propagating, storing, and growing plants, a large garden has been formed with greenhouses, gardener's house, sheds, &c. (27).

From an announcement in another column it will be seen that Mr. Jackman was placed third out of eighteen competitors for his plan of the public park to be constructed at Poole. In addition to the references cited in the text, we may add that on the plan (13) indicates the position of statuary, (14) Rhododendrons, (15) that of flower-beds, (19) the bandstand, (21) boat-house, (22) summer-houses, (23) aquatic birds, (26) retiring-rooms, (28) gardener's house, (29) greenhouses, (30) sheds.

FUCHSIA TREE AT BALLME HOUSE, RAMSEY, ISLE OF MAN.

We illustrate above (fig. 79) a large Fuchsia, *F. magellanica* (coccinea), which is 15 feet high, and has a girth of 80 feet. This tree was planted either in the year 1834 or 1836 by a girl at that time in the service of a Miss Judith Christian, the then owner of the Ballme estate, Fuchsias being at that time somewhat rare in the

where local showers did some damage, but these are decided exceptions to the general rule. The yield of Peas is above the average, and more especially is this true in relation to the wrinkled varieties; prices will rule extremely moderate in consequence compared with some dear years, with the probable result that the wrinkled Peas which have already done much in the way of thrusting the old round kinds out of cultivation, will be now more extensively grown. The stocks of Peas already received are of excellent sample, and it is believed that the quality of the colonial grown Peas, always high, will be quite equalled by those grown in this country.

Samples of Broad Beans that have come to hand are remarkably good for colour and condition—they have rarely ever been surpassed.

Turnip seeds of various kinds have been well harvested, and it is reported there is generally a fair average crop.

Onion seed, that promised well in the early part of the season, is much weakened owing to mildew having largely attacked the stems in some localities, and if another week's fine weather continues the crop will be fully ripened: on the other hand rain would have a most disastrous effect upon it.

Late crops, such as Beet, Carrot, Radish, Parsley,

sent to him. I admit that the fruit has a considerable resemblance when ripe, but I never considered that they were identical. They are both described very fully by Dr. Hogg, in the *Fruit Manual*. The leaves of the variety Alexander have round glands, and those of Amsden are kidney-shaped. We grow both of them in pots, but if there is room for one only I would plant Alexander in preference. I have not grown Waterloo, but I believe it ripens with Alexander, bears freely, and the fruit is also larger. It was raised at Waterloo, New York, and is also well described in the last edition of the *Fruit Manual*. I never found any difficulty in setting the blossoms of Prince of Wales Peach; we have always had a full crop, and I have grown it since the first year it was sent out. "Vagabond" omits the three best Peaches in cultivation from his list, viz., Bellegarde, Grosse Mignonne, and Royal George.

The true Early Grosse Mignonne is a most excellent early Peach; in our orchard-house at Loxford Hall it was quite ten days earlier than Grosse Mignonne, although not quite equal in quality to that fine variety. There have been many mid-season Peaches introduced during the last few years, but were I confined to two varieties, they would be Grosse Mignonne and Bellegarde.

AUTUMN COMPOTE PLUM.

I should like to say a few words in favour of this variety. I do not say it is the best Plum for preserving or for any other culinary purpose, but it is as good as any known to me, and we have Cox's Emperor, Victoria, and Pond's Seedling growing with it. Its great value is in the fact of the fruit ripening about the end of September, when most of the large Plums are over. The fruit is of large size, and rather paler than that of Victoria. It succeeds Cox's Emperor. *J. Douglas.*

Florists' Flowers.

THE AURICULA.

I HAVE just finished the second repotting of the Auriculas. Those repotted early have been attacked by aphids. There is no better cure than taking the plants out of the pots, forking out the aphides with a pointed stick, and repotting. In some collections of stove plants a very similar parasite attaches itself to the roots, sometimes entirely covering them with a white fluff. It can only be destroyed by constantly repotting the plants, after removing as much as possible from the roots. I have never seen an Auricula injured by the woolly aphids, whereas the ordinary greenfly that attacks the leaves would, if undisturbed, kill the plants in a few weeks. The hot weather up to the first week in September has been very trying to show Auriculas. The plants have been kept tolerably dry at the roots to prevent their blooming, which they will do notwithstanding all precautions. Seedlings from seeds sown last autumn or in the spring of the present year may be potted on as they require it. The alpine out-of-doors have passed through the warm weather admirably; they are deep green in the foliage, and have lost few leaves. Caterpillars and the leather-coated grub are troublesome at this season; but their destruction is one of the incidents of everyday experience.

THE CARNATION AND FIGOTEE.

These seem to appreciate dry hot weather with heavy night dews; the layers have made exceedingly good and healthy growth in our garden; and they will be quite ready to be taken off the last week in this month; but if the operation is delayed until October it will not make any difference. The plants are best out-of-doors, although we have a considerable number under glass, left there to protect the seed-pods from wet. As the seed-pods ripen and are removed the plants are at once turned out-side; they are in an open position, exposed to sun and wind. The soil is prepared now, by carefully looking over the loam and manure to pick out from it all grubs and wireworms. The loam used to pot the layers in is much finer than that for potting them in to bloom; less decayed manure is used, more leaf-mould, and a larger proportion of coarse sand. When repotted place the plants in a cold frame, the lights of which must be kept rather close by day, but in calm nights they are drawn off to expose the plants to the cool night air, and to allow them to be saturated with dew. Push the lights on again in the morning before the leaves are quite dried by the sun; tilt the lights a little, and shade for a few hours during hot sunshine. The old stools, on which there are sure to be a few unrooted layers, may be planted out in the open garden, or be given away to friends or neighbours, who may have room in their gardens for them. *J. Douglas.*

The Rockery.

ALTHOUGH the rockery does not wear the bright aspect it did some few weeks since, yet there is still much to attract the attention, as the autumn *Ericas* are now in full bloom, of which I give the names:—*Erica vulgaris*, *E. Scarpil*, *E. carnea*, *E. vagans*, and *E. multicolor alba*. *Cotoneaster microphylla* is also covered with its bright scarlet berries; planted on the high part of the rockery, and allowed to hang down, it is very effective. *Smilax aspera* is very attractive with its bright foliage, but it does not often

fruit with us. The various varieties of Ferns are now assuming their bright autumn tints, but especially noticeable is the Beech Fern, *Polypodium phegopteris*: this, after changing to a bright golden colour, remains for some time like this, so that large clumps of it, as growing here, are very effective. By keeping the rockery all picked over, and removing all Fern fronds as they get unsightly, this department will be kept attractive for some few weeks yet to come. *Edward Ward, Head Gardener, Brounsgrove.*

The Flower Garden.

PROPAGATION.

VERBENAS and other soft-wooded plants may still be propagated, where the stock is deemed insufficient, but a gentle bottom-heat will now be necessary to secure success with them, and they will require very careful treatment to winter them successfully, when propagation is so long deferred. Those struck in July and the beginning of August, and treated on the cool principle may be successfully wintered in cold pits with a covering of straw or mats to exclude frost although a few degrees will do them little injury. In order to accomplish this good drainage is the first essential, say 6 or 8 inches of clinkers surfaced over with coal-ashes. The pots should be stood on boards as close to the glass as possible, and these should be elevated on flower-pots to allow of a free circulation of air beneath the pots. The points of the shoots should be within 2 or 3 inches of the glass. The sashes should be tilted every cool day, and removed every fine day. When water is necessary, sufficient should be given to moisten the whole soil in the pots, choosing the earliest opportunity on a sunny day, when the sashes can be left off so that the superabundant moisture may be dried up as far as possible before it is necessary to close the pits for the night. Should the nights be mild, a little air being allowed will serve to prevent mildew. Cuttings of *Gazania splendens* may now be put in to strike. A treatment similar to that for *Violas* will be found to answer for these, as the plants are all but hardy. An old sash and a little straw, or an old mat or two, will afford all the protection necessary in the severest weather. Bedding *Felargoniums* may still be struck from cuttings, but they will be better under the protection of glass sashes than standing out-of-doors, as the weather is not to be depended on for a single day now.

CALCEOLARIAS.

Towards the end of the month it will be necessary to secure a stock of *Calceolaria* cuttings for next year. This had better be deferred as long as possible, but it should be attended to before frosts set in, as the cuttings are more subject to mould if they have sustained any injury to the foliage. The best place to strike them is behind a wall, facing the south; the less sun the plants receive during the rooting process the better. Make a good hard bottom of ashes and let it be firmly beaten down. On this place the frame, then in this put some rough leaf-mould, to the depth of 1½ inch, then some finer leaf soil, with a slight addition of river or sharp pit sand, finishing off with about 1 inch of pure sand. Prick in the cuttings from 2 to 3 inches apart each way, give a good soaking of water to consolidate the whole, shutting up the sashes and keeping them constantly closed. They will require no more till they are rooted. If the sun is prevented from striking the glass (which it cannot do if thus situated) during severe frosts they will require to be protected with mats or straw. In dry seasons *Calceolarias* are very unreliable unless they be liberally treated, and receive due attention at the proper time. *Aplexicaulis* is a good old sort, but different localities have their most suitable kinds to depend upon. What suits one district may prove a failure in another.

PLANTING EVERGREEN SHRUBS AND TREES.

This may now be satisfactorily proceeded with. The heat in the soil at this season of the year will assist in the formation of fresh roots before the winter sets in, and the plants will be in a much better condition to meet the parching winds of March than those which are planted during winter. Where the

soil is cold, and general stagnation prevails, avoid slushing the roots with water, as this will retard rather than assist root action, but rather dew the plants frequently with the syringe or garden-engine. Previous to planting let the soil be well trenched or the pits made twice or thrice as large as requisite; no plant will thrive in a thimble. In lifting the plants preserve as many of the roots as possible, and secure as much ball as will hang to the roots with each. The planting of deciduous trees and shrubs had better be deferred till the bulk of the leaves have dropped off and the growth of the present season matured.

LAWNS.

In order to maintain a neat appearance the mowing machine will require to be kept going and the edge clippers should be freely used. Do not use the edging iron at this late season if it can be avoided, else the edges will crumble down with the frost. Edgings should only be cut to preserve uniformity of width. Turfing may now be undertaken, and all *Plandains* and other weeds may be removed from lawns as opportunity offers. *W. H. Bailie, Luton Hoe Gardens, Luton.*

THE ORCHID HOUSES.

ORCHIDS IN COOL HOUSES.

REPOTTING.—During this last fortnight we have been overhauling our specimens of *Odontoglossum crispum*, dipping and cleaning the plants, washing the pots, and removing overgrown moss. I do not advise clipping of the latter with shears, but to tear it away rather deeply, rather than to pinch off the green heads. My reasons for doing the cleaning first is because it is of more importance than the potting, and should be finished as quickly as possible, or the insects might spread from the plants; not cleaned to those already done.

There are now so many recipes for Orchid-dipping mixtures, and almost every grower has his own favourite one, but none are so infallible as to prevent the insects spreading to the plants again. Very few insecticides that are used cold will injure the plants, if not left on too long before thoroughly washing off with rain-water. After the cleaning is done the potting should be commenced, as I still think the autumn the best time for this operation. If those plants that were shaken clean out last season and then replaced into such smaller pots have made plenty of roots, and appear too large for their pots, they may be shifted into larger ones, disturbing the roots as little as possible, keeping the weaker bulbs of the plant closer to the side so as to place the leading growths near the centre. Those plants that require to be freed thoroughly from the old potting material should have all their dead roots cut away.

In selecting a pot I never provide against the plants growing over the sides, as I believe many are made unhealthy through over-potting, but take one just large enough to hold the roots comfortably, draining it with clean crocks for about two-thirds its depth, then place a layer of sphagnum moss, above that a few lumps of good fibrous peat, afterwards using about two-thirds moss to one-third peat. Fill the pots nearly to the rim before placing the plants on it, then spread the roots around, putting a few lumps of compost under the plant to raise it to the desired height. After the potting is finished clip the surface over, and then set a few live heads of sphagnum about over it. The potting should be done very lightly, only pressing the compost firm enough to steady the plants. We shake a little very coarse sand on the surface, which gets washed in when watering. From the time of potting until the spring the surface and the pots should be kept damp, using a fine rose syringe, after which time the watering-pot can be used. Give the plants as much light as possible without letting the sun actually shine on them.

MASDEVALLIAS.

The month of September is a good time to break up and re-pot *M. Harryana* and its varieties, *M. Lindenii*, *M. Veitchii*, or any that are not coming into flower. Here the plants are treated much the same as the *Odontoglossums*. In potting they require less drainage; we fill the pot one-third with crocks, mixing a few with the potting material, the peat is broken up rather smaller than for *Odontoglossums*.

glossums, and more of the earthy matter is retained. A compost might be mixed before commencing potting, of equal parts moss and peat, which can be used about the roots of the plants, but finishing the surface with larger pieces of peat and sphagnum moss not mixed beforehand. I have used for Masdevallias of late years some half-rotten Oak leaves rubbed through a sieve; this, I believe, benefits the plants, but still there is the risk of getting fungus in the pots. We also use a little coarse sand, as for Odontoglossums. When turning out a Masdevallia to pot it, my practice is to divide the plants into smaller pieces without the use of a knife; after cutting away dead roots, tie a small stake to some if not all the pieces, keeping the crowns a little above the rim of the pot; select the longest leaves for the centre, and as the plant is put together place some moss and peat between each piece, keeping them all firm. If we have a plant of an extra large size that requires a pan—say, over 2 feet diameter—I adopt the practice of placing the pieces a few inches apart. After potting take care not to let water touch the young growths, for during the period of small rootation they soon rot if wetted. Give them moisture in the same manner as recommended for Odontoglossums. Masdevallias should never be allowed to get dry at the root at any time. Before potting the plants they should be all dipped and cleansed from insects, so that there shall be no need to disturb them some time after. The cool houses will now be closed at night, and the shadings should not be used more than is really necessary; we have taken it off the Dendrobium-houses and the north sides of warm houses. *C. Woolford, Downside.*

PLANTS AND THEIR CULTURE.

CONSERVATORY.

THE removal of stove and intermediate plants to their proper quarters divests this structure of its chief ornaments. Fine-foliage and flowering plants of a more hardy character should now be put in their places; these include *Dracænas*, *Palms*, *Grevilleas*, *Ferns*, *Celosiæ*, *Fuchsias*, *Salvias*, *Tuberoses*, *Gœdeltias*, *zonal Pelargoniums*, *Begonias*, *Mignonette*, *Petunias*, &c.; when these are arranged with taste, they make a nice display. If any stove plants are still in this house, they must be treated with great care as regards watering; if this is reduced, and the ventilators opposite to where they are staged be kept closed, they will not be hurt for a few days. Go over trailers and creepers; thin out the shoots, stop the laterals, and pick off the dead foliage. If these plants be left alone, they very soon shut out the light from the occupants below, which soon suffer in consequence.

FERNS.

These will now be gradually getting to a quiet state of growth, and will require less watering, but they should not be allowed to become very dry. Place all plants of *Gymnogramma* and *Chelanthæ* in a dry atmosphere, or they will soon turn rusty; all deciduous kinds, whether stove or intermediate, should be placed in the coolest part of the house, but on no account let them get dry, or they will be found to be very weakly in the spring. Any plants of *Gleichenias* that have been in cool houses will require to be placed in warmer quarters for the winter, and such species as are subject to thrips, which include *Lomarias*, *Woodwardias*, and a few others, should be closely watched in order that they may not get disfigured, which they soon do should the pests once get a lodgment on them. The quickest and most effectual way to get rid of thrips is to dip the plants in rather strong tobacco-water, but in no case should this be done unless the fronds are matured. *A. Evans, Lytch Hill, Haslemere.*

HARDY FRUIT GARDEN.

GENERAL WORK.

THE bright sunny weather experienced for the past week has been most favourable for the ripening of late fruits, and the change which has occurred in the colour of the wood on wall Peaches, &c., under its influence shows clearly that it has done a vast amount of good in this direction. Morello Cherry and Peach

trees, &c., from which the frosts are now cleared, should occasionally receive a thorough washing with the garden engine so long as the bright weather lasts, and this should take place early enough in the day to allow the trees to get dry ere nightfall. A newly made growths, especially on choice Peaches, Nectarines, &c., should be kept persistently pinched out, in order that every available ray of sun may reach the fruiting wood. Any Peach trees, &c., which seem to have made too much fruiting wood, and more than is really required for next year's service, should have part of it cut away at once. It is very rarely we see the wood of outdoor Peach trees raised out so thinly as it ought to be. In the case of fruit trees which have been unfruitful during the past season, and in which the result may be attributed to an over-vigorous growth, this is the time, before the soil gets into too wet a condition, to proceed with root-pruning. No hard-and-fast rule can be laid down for the execution of this kind of work, but the case of each tree must be studied and treated according to the number and quality of its roots and the size of the tree. The proper way to proceed with root-pruning has been many times detailed in these columns, and there remains but little to add; however, I may say when carrying out the work make certain that all gross roots taking a downward course immediately beneath the ball are severed, otherwise all the labour of excavating the soil round the ball may have been undertaken in vain. The workman must have a good wide trench round the outside of the ball, and of sufficient depth to enable him to work his spade well under the ball of soil containing the roots to be pruned. It is better to err on the safe side, and root-prune a tree two years in succession, than to overdo it, thereby causing a sudden check, such as the tree would not sufficiently recover from to enable it to carry fine fruit for several years afterwards. Any old worn-out trees on walls should be grubbed up as soon as the fruit, if any, is gathered, and fresh soil procured at once in readiness for planting new ones. The state of the old soil and other circumstances will indicate whether the drainage already present is sufficient or otherwise. When planting young trees in old worn-out soil excavate at least a cartload of it, and replace with good virgin loam if possible. Before planting the young trees the re-pointing of the wall should be done, if necessary, not only in order to destroy all harbours for insect, but to preserve the wall in a good state.

GATHERING FRUIT.

Fruits of late Peaches, Figs, Plums, &c., when gathered, should be placed in a warm dry house for several days before being sent up for dessert. Continue to gather Apples and Pears as the different varieties become ready, being careful not to place too many fruits together when conveying them to the fruit-room. All fruits which are the least pecked by birds should be kept apart for immediate use. Hard Pears in this condition are adaptable for stewing purposes, whether they are stewing varieties or not; keep the fruit-room as cool as possible, by the aid of shutters partly closed either inside or outside the windows. In the absence of these, mats may be hung up, which will answer the purpose well. If the fruit-room is not damp, no air will be required. *G. H. Richards, Somerley, Ringwood.*

The Kitchen Garden.

LETTUCE AND ENDIVE.

SOME portion of the latest sown plants can be drawn from the seed beds and pricked out singly on to raised beds in sheltered positions; into cold frames or underneath the shade of walls, where, if necessary, some protection can be afforded them during severe frosts in winter.

Towards the middle of next month Lettuce fit for use should be fitted with good balls attached to them, and planted into cold frames near the glass, and as thickly together as possible without touching each other. After receiving sufficient water to settle the plants in their new positions, all the air possible should be given by removing the lights entirely, as often as possible, closing them only during rain or frost. Where frame accommodation is limited or wanting, a temporary bed of ashes spread in a sheltered corner, or against a south wall, with some provision to throw off heavy rains and exclude

frosts, will suffice for the planting and storing of full grown Lettuces, and considerably prolong the supply. Full grown curled Endive should also be lifted and treated in a similar manner to Lettuce, and when stored on ash beds a portion can be tied up and plunged deep enough to bleach. Italian Endive, being more liable to decay, should if possible have frames placed over the most forward plants where they have been grown, or have flower-pots placed over them, which, in the event of frost, can be protected by bracken or straw litter. Whenever Endive or Lettuce is covered or tied up for bleaching purposes, it is most essential that both should be in a dry condition at the time, and also that all frames containing the same should be kept well aired, and all decayed leaves removed at once.

CAULIFLOWER.

Provision should also be made for these by pricking out into good soil, in frames near the glass, young plants of Early London, Walcheren, and Veitch's Autumn Giant, to stand through the winter: a portion also may be transplanted on to beds, where they can when necessary be hooped over and matted; hand-lights being available for the purpose, should be placed in position at a distance from each other sufficient to allow of the easy removal of the lights for giving air, &c. On a piece of ground which has been well manured from six to eight plants may be allotted to a light until spring, when finally four only should be allowed to remain, the surplus ones being used for filling up blanks and additional plantings. After the plants have recovered the check of moving, and during the winter, they should be exposed as much as possible whenever the state of the weather will permit, to render them firm and hardy; an occasional dusting of soot or lime followed by a surface stirring between the plants with a hand-fork, will tend to keep slugs in check, and the soil in a healthy and sweet condition.

FRENCH BEANS.

Another good sowing in pots should now be made. A cold frame will suffice at present and until the seeds germinate, when they can be removed into a warmer temperature. Those sown as advised in a former Calendar should now be top-dressed and put under glass. Late sowings on outside borders, and which are now coming into bearing, can be easily protected from early frosts and the supply prolonged by forming a rough trellis with stakes sufficiently high and strong to bear a light covering of tiffany or mats at night.

CUCUMBERS.

Encourage the plants intended for winter fruiting to cover the trellis allotted them by maintaining a brisk growing temperature, and by the addition of fresh soil at the roots. Avoid overcrowding of the foliage, allowing sufficient space for each leaf to fully develop itself. Air should be given gradually and freely during bright sunny days, care being taken in doing so to prevent the plants from drooping; a little air can also be given on mild nights through the top ventilators, unless the fruits are required. Keep the blooms removed as fast as they appear. Plants fruiting in dung frames will require additional lining, and should be closely matted at night. *John Austen.*

PLANT PORTRAITS.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Sept. 27	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
WEDNESDAY,	Sept. 29	Sale of Dutch Bulbs, at Stevens' Rooms.
THURSDAY,	Sept. 30	Sale of Imported Orchids from Mr. F. Scudder, at Stevens' Rooms.
FRIDAY,	Oct. 1	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
SATURDAY,	Oct. 2	Sale of Dutch Bulbs, at Stevens' Rooms.

THE harvest of the TOBACCO at Forest Hill was commenced by MESSRS. JAMES CARTER & CO. on the 18th inst. The two or three cold nights previously, with rumours that 3° or 4° of frost had been registered in the neighbourhood, induced Mr. C. H. SHARMAN—who from the very first has taken a deep interest in the results of the Tobacco trial—to commence cutting the crop. A beginning was not made until past 4 o'clock, owing to Mr. SHARMAN having been detained in London, but a band of a dozen labourers soon laid nearly one-fourth of the crop low. Mats were laid upon the soil, and then, by the use of a strong knife, the stalk was cut through close to the roots after the plant had been bent a little on one side by the left hand; the plants were then laid carefully on their sides on the mats in a line, and a further layer of mats placed over them. The remainder of the crop was cut on Monday, and the plants got under cover on that and the next day. So far the weather has favoured the proper ingathering of the crop, and the leaves were rapidly beginning to take on a tint of greenish-gold, which is said to indicate the proper time to harvest.

A commodious barn close by has been engaged for the "curing" process. This is undertaken by an expert, and the result will be watched with great interest, especially in the immediate locality, where the culture of such an unusual crop in this country may prove to be an event of the highest importance. A light wooden framework is fitted up in the barn, and when the plants are taken there they will be fastened to stakes 5 feet or so in length, as many as can be conveniently attached, the base upwards, so that the leaves can hang downwards; and these stakes will be placed on the framework so that they can be supported at each end, and here the leaves will gradually dry. It is said that artificial heat will have to be introduced for three or four days at least, to ensure that the drying process is complete. How long the process of "curing" will occupy remains to be seen; probably much will depend upon the character of the weather in the next two months. The proper curing of the leaves is undoubtedly the most important point—on that will depend the commercial value of the experiment. Various sorts of Tobacco have been grown in this country for years past for garden ornament: we have yet to learn whether it can be made a profitable crop in this country for manufacturing purposes.

As a matter of course, Tobacco being an article subject to excisable duties, the requirements of the Excise officer have to be considered and obeyed in all stages. So far this official appears to be acting in perfect harmony with Mr. SHARMAN, and there is little fear of any official restrictions interfering with the perfect harvesting of the crop.

Presuming that the curing process is carried out in a satisfactory manner Mr. SHARMAN is hopeful that the yield will average at least a ton per acre. This must of necessity be a rough guess, and it is to be hoped it will not be much below the quantity hoped for. When the curing process is complete the crop will pass into the hands of a Liverpool firm for manufacturing purposes.

Altogether seventeen varieties of Tobacco were tried, and to make the experiments as complete as possible the very best varieties were obtained from the most reliable sources.

The names of the varieties are Big Frederick, Can-seed Leaf, Connecticut, Florida, Glasner, Havannah, Hester Virginia, Island Broadleaf, Kentucky, Maryland Broadleaf, One Sucker, Pennsylvania, Virginian, White Burleigh, White Stem, Yellow Orinoco, and Yellow Prior. The seeds were sown in heat, the plants grown on into size and planted out in rows, being about 2 to 2½ feet apart each way. A good dressing of manure was given to each plant when placed in the ground, but though they grew very strongly, they appear to have assimilated only a portion of it; and each plant was helped by having a small mound of earth drawn up about the roots. At a certain stage the flowering stalks were cut away, leaving the plants to develop and mature on an average nine large basal leaves each. In point of

FIG. 80.—SPIRANTHES ROMANZOVIANA: THE EVICTED ORCHID.

height of growth there was but little perceptible difference, and the sameness of character applies equally to the blossoms.

The group of seventeen varieties could be divided into two distinct types—one with dark, somewhat pendent, and distinctly corrugated leaves, especially on the margins; the other with paler, smoother, and semi-erect leaves, quite hiding the stalk from view. The last type resembles in growth the prickly Comfrey. The varieties composing it are Glasner, Island Broadleaf, Kentucky, Pennsylvania, and White Burleigh. A few of the finest for gardening ornamentation are found in Big Frederick, Glasner, Island Broadleaf, Kentucky, White Burleigh; the two last-named greatly resemble each other, they have white midribs to the leaves, and appear to be both early in maturing; and Yellow Prior. Altogether there were sixty-four rows of plants, and about sixty plants in a row.

The piece of ground planted appeared to include three different kinds of soil: at the upper portion was a gravelly soil, next came a good and rather dark loam; and the lowest portion (for the plot of ground fell away from the south-west to the north-east) was bog, and rather moister than the rest. But as each row passed athwart the ground, some of the plants of each variety were growing in each character of soil; but the difference of development was only slightly perceptible, the strongest and best developed generally were in the loam.

THE announcement of the possible destruction of one of the very rarest and most interesting of British plants (*Spiranthes Romanzoviana*) made in one of our recent issues, is, unfortunately, a matter little likely to interest Home Rulers or peasant proprietors; but the Irish division of the British nation—still more, the Irish nation—might well take measures to prevent the eviction of so distinguished a citizen, and one in whose protection and perpetuation the Irish might be expected to take special pride. The plant is one little likely to interest the Floral Committee of the Royal Horticultural Society, and the Scientific Committee, who naturally would feel more keenly on the subject, could only protest. The authorities at Kew, who were invoked to come to the rescue, could hardly interfere to better avail. Meantime we place a practical proposal from the other side of Europe at the disposal of those concerned in the honour and scientific welfare of Ireland. M. NAUDIN, the accomplished head of the rich botanic garden at Antibes, thus writes:—

"I read in the *Gardeners' Chronicle* for September 11, p. 349, the regret expressed concerning the destruction of this very rare Orchid in the only station in which it grows in Europe. It is plainly to the interest of science to protect rare species of plants and animals against vandalism, and botanical and horticultural societies, as well as amateurs, should acknowledge this responsibility. We need not, however, altogether despair of again seeing the plant which is the object of this regret. It is probable that the labourer who disturbed the ground where it was found to plant his Potatoes has not altogether destroyed the tubers of the *Spiranthes*, and that some day the plants will reappear if cultivation be discontinued, the Potatoes rooted up, the ground levelled and allowed to remain a waste as formerly; if the tubers of the *Spiranthes* still exist the plant will certainly reappear. A good way of preserving rare species like this would be to plant them in private grounds, where no one would disturb them. They should be planted in situations and in soils like those in which it usually grows. Here is an example. There is at Collioure a locality—the only one in France—where the beautiful North African *Scolymus grandiflorus* is found. This locality is less than 2 hectares in extent, and it is very likely that one day or other it may be cleared and planted with Vines, consequently *Scolymus grandiflorus* will disappear. Foreseeing this occurrence I have sown some seeds of this pretty plant in the waste spots which surround the Villa Thuret, and the experiment has succeeded perfectly. I saw to-day among the brushwood of these places superb specimens of *Scolymus*, which flower in May. I showed several to M. THOMAS HANBURY one day when he visited me at the Villa Thuret."

As so much interest is felt in this plant, we reproduce our illustration (fig. 80) from our number for October 8, 1881, p. 465, where also will be found a brief summary of the history of the plant, and of the interesting speculations to which it gives rise. The specimen figured was grown by Mr. BURRIDGE in the Trinity College Botanic Garden, Dublin, the plant having been originally collected in its native locality by Professor PERCEVAL WRIGHT. Let us hope Mr. BURRIDGE has contrived that the plant shall increase and multiply. The head-quarters of the species are in the United States.

— CATTLEYA MOSSIE: A FINE SPECIMEN.—Fifty years' experience of this noble Orchid has but served to confirm and strengthen the good opinion of

The Gardener's Chronicle.]

FIG. 81.—CATTLEYA MOSSIAE, GROWN IN THE GARDENS OF E. A. LENTHAM, ESQ., M.P. (SEE P. 400.)

September 15, 1866.

it formed by the lovers of Orchids at the time of its introduction, and it is still regarded as one of the very finest and most lasting of early summer-flowering Orchids. A glance at our illustration (fig. 81) will serve to show to what perfection the plant may be brought by good cultivation. The figure was prepared from a photograph of a plant grown by Mr. F. EXELL, gardener to E. A. LEATHAM, Esq., M.P., Misardien Park, Cirencester. The plant in question produced this year from thirty-six flower-sheaths over ninety flowers, each 8 inches across. The variety is a very fine one, the sepals and petals being of a bright rosy-magenta, and the rich crimson and yellow labellum is very beautifully fringed. Mr. EXELL is a great advocate for plenty of light and air for Cattleyas, with rather a cooler temperature than many give them, and in his comfortable and well-arranged intermediate-house he further demonstrates his belief in reasonably cool treatment by growing to perfection with his Cattleyas some very fine *Phalenopsis*, *Vandas*, *Aerides*, and *Dendrobies*. Many of his plants of *Cattleya Trianae* were very heavily flowered last season, some of them closely approaching in excellence the plant of C. Mossie here illustrated.

— "MALPIGHIA."—The second part of this new Italian botanical journal contains an article on Sicilian amber, which differs chemically from that of the Baltic, and in which, up to the present time, few vegetable remains have been found.

— NEW RHODODENDRONS. — M. FRANCHET has lately described in the *Bulletin* of the Botanical Society of France, some new *Rhododendrons* from Tibet and Yun-nan. Among these *R. calophytum* has long leathery leaves, and trusses of large spotted white flowers. *R. rotundifolium* has leaves like those of a *Limnanthemum*; *R. Davidi*, belonging to the Caucasian group, has leaves of a golden yellow on the under surface; *R. Delavayi* has trusses of cherry-red coloured flowers surrounded by leaves which are glaucous above, reddish-brown beneath. *R. dendrocharis*, a small species which covers the trunks of trees with its purplish flowers; and sundry others. We may hope that seeds of these will be forthcoming in due time. M. FRANCHET alludes to the value of studying the hairs on the leaves as points of distinction between species, but always in association with other characteristics. Some species have no hairs, others are provided with scale or shieldlike hairs, others with an investment of felted hairs, and so on.

— ANOTHER NEW POTATO.—According to the *Revue Horticole* M. SAEC has discovered a new form of the potato in Bolivia, where it is said to be very productive, yielding four crops a year [], and where its tubers weigh from 100—250 grammes. Analysis of these tubers shows that they contain 20 per cent. of starch and 72 per cent. of water.

— HELF ACKNOWLEDGED.—"G. B." writes to us from 12, Penge Road, Norwood, to say, that having been out of work for eleven months, and having a large family dependent upon him, he has been driven to great straits. Some of his brother gardeners, hearing of his case, have helped him so far as they could, and it is to them he desires to make his acknowledgments. Further assistance is, however, greatly needed. "G. B." had the management of a large garden establishment at Southampton for six years, but his services were no longer required, the garden being devoted to other purposes, and the proprietor having gone abroad. On enquiry, we learn that the statement is correct, and "G. B.'s" late employer gives him a good character for industry, sobriety, and good conduct.

— NEW ZEALAND EDIBLE FUNGUS.—For the benefit of a correspondent who made enquiries of us lately we extract the following from the current number of that excellent periodical, the *Pharmaceutical Journal*.—"An edible fungus, which is shown in the New Zealand department of the Colonial Exhibition (*Hirneola polytricha*) forms an article of considerable export to China, where it is used largely as an ingredient in soups, &c., and also as a dye for silks. It is imported from New Zealand to the extent of about 100 tons per annum. This fact suggests that other objects of Chinese commerce might be worthy of cultivation in the colonies, such as the true *Ginseng*. A full account of this fungus may be found in a previous volume of this journal [3], xii, p. 866).

It bears considerable resemblance to the Jew's-ear fungus of this country, which is common on Elder trees in damp shady places." Our own columns contain an article on this subject (see p. 464, October 8, 1884).

— BOTANY IN MEDICAL EDUCATION.—We had occasion recently to mention incidentally the fact that the authorities had determined to remove botany from the curriculum of medical education, and we expressed our opinion that, whatever changes in the mode of teaching be required, the exclusion of botany from medical education is a serious mistake. We are glad to find similar views expressed at a recent meeting of the British Pharmaceutical Conference by Professor HILLHOUSE. "The collective wisdom," says he, "of the conjoint Colleges of Physicians and Surgeons has ordained that a branch of knowledge which most ordinary people would consider to be dependent on prior chemical and botanical training, shall henceforth, while retaining its chemical, be deprived of its botanical basis." At the same time therapeutics, or the proper use of drugs, has to be taught during the first year of the student's career:—

"But underlying this matter there is a grave principle at stake. Is it, or is it not, true that from the vegetable kingdom the physician draws, and will probably continue to draw, his most potent drugs, his most certain remedies, his own specifics? Is it, or is it not, true that the most valuable applications of medical knowledge, in the way of new modes of treatment, and of the ability to grapple with hitherto omnipotent forms of disease, have been, and increasingly are, most closely associated with a knowledge, a practical knowledge, of the phenomena of plant life? If this be true, is it not mortgaging the highest possibilities of the future for a mess of pottage to risk in even the smallest degree the powers of a grand profession for the sake of some fifty or sixty hours gained by excluding the subject of botany from the medical student's curriculum? Or, at least, let the medical authorities be consistent, and, by excluding equally the subjects of chemistry, botany, and physiology, the conjoint basis of medicine, send their students out armed with power of life and death, but without even the shadow of a preliminary scientific training."

— LANDSCAPE GARDENING.—The Town Council of Poole having offered prizes for the best plans for laying out a recreation ground given to the town by Lord WIMBORNE, has awarded the 1st prize to MESSRS. R. VEITCH & Son, of Exeter; and the 2d to Mr. R. Upcher, of Seale, Norfolk. It appears that eighteen plans were sent in, of which four were selected for further consideration, the four comprising, as we are informed, those of Messrs. K. Veitch and of Mr. R. Upcher, as above-mentioned; Mr. George Jackman, jun., of Woking; and Messrs. J. Veitch & Sons, of Chelsea. Other plans, as we learn from the *Poole and Bournemouth Herald*, were sent in by Messrs. Lovegrove, Usill, Backhouse of York, J. R. Reid, Barron & Son of Borrowash, G. B. Simpson, J. Kingsnorth, Little & Ballantyne, Cheat & Sons, S. S. Marshall, J. Anderson of Meadowbank, Golding (query Goldring), Ponton, and W. H. de Caple, Cardiff. The journal from which we quote gives details as to most of the plans, but as these have reference mostly to strictly local requirements we do not extract them.

— EDUCATION.—A very celebrated surgeon of our acquaintance, in higher repute as an operator than as a lecturer, was wont to tell his class when lecturing on surgical diseases—"you must treat them, gentlemen, on general principles;" but he did not devote much attention to explaining what those principles were, being evidently much more expert in the use of his hands than of his brain. The consequence was, that little reliance comparatively, was placed on the opinion of the surgeon, but very much on his operative skill. We are reminded of this circumstance by the discussion on education now taking place. To use the power of thought and reasoning, says Prof. HILLHOUSE, "this is a prime factor in true education, and I would rather have a man who thinks wrongly than one who does not think at all. There is hope for the one, none for the other. Once get principles and reasons well grounded, and facts march themselves. Facts without reasons are like a fleet of vessels without crews, capable of no concerted and intelligent action, but nevertheless readily capable of mutual destruction."

— ROOTS.—Another illustration of the wonderful faculties with which roots are endowed has lately been made known by Messrs. VAN TIEGHEM and

DOULIOT. Botanists have long known that in the great majority of cases the roots originate in the interior of the axis, and find their way outside by, as was supposed, pressure of the growing tip of the root on the surrounding tissues. The two botanists whose names we have mentioned show, however, that the rootlets, buried at first in the substance of the main root, make their way out by secreting a fluid which destroys the neighbouring cells, converting them first into jelly, and then dissolving and perhaps absorbing them. The action of the rootlet, then, in the tissues of the root from which it originates, is similar to that by means of which it attacks the particles of soil and derives food-material from it. The action is also the same as that by means of which an embryo plant—say, of Wheat or of the Cocoa-nut—destroys the albumen surrounding it, and appropriates it for food.

— MYOPORINEOUS PLANTS.—Some time since, we had occasion to publish a woodcut, representing what we know as a greenhouse shrub as a tree of no slight magnitude. For the photograph we were indebted to Baron F. V. MUELLER. That unwearied labourer has now issued a quarto volume of seventy-six lithographic plates, representing all the species of this order, the members of which are distributed throughout Australia, attaining their highest development in the hottest and most arid regions. As many of these plants run a risk of extinction by fire and pasturage of animals, it is desirable to place on record descriptions and figures of these plants, many of which are very suitable for conservatory decoration in this country, their bright flowers being produced nearly throughout the year. The drawings have been made by Mr. GRAFF.

— HORTICULTURAL SOCIETY OF GHENT.—At a meeting held on September 13 the following awards were made:—First-class Certificates: To Mr. James Bray, for *Vanda Sanderiana*; to MM. Jacob Makoy & Co., for *Curmeria Kegeliani*, and for *Davallia tenuifolia Veitchii*; and to M. Linden, Director of the Compagnie Continentale d'Horticulture, for *Alcaesia Lindeni*, *Cupania denticulata*, and for *Aphelandra macedoana*. Cultural Certificates: To M. Aug. Van Geert fils, for *Alcaesia Van Houttei*, and for *Siphonogyne imperialis*; to M. Desmet-Duvivier, for *Miltonia Clowesi*; and to MM. Vervaeet & Co., for *Cypripedium Parishii*. Commendations: for novelty, to MM. Jacob Makoy & Co., Liège, for *Finanga spectabilis*, and for *Adiantum Weigandii*; to M. Aug. Van Geert fils, for *Croton Allicie*; and to M. Linden, for *Ardisia velutina*. For good forms, to MM. Vervaeet & Co., for *Lelia eupathia*, *Billeta pulvinaria*, and *Cattleya Dawiana*; and to M. Linden, for *Cattleya Eldorado*. For culture, and to M. Bern-Spac, for *Asplenium dimorphum*.

— CARRIAGE OF FRUIT.—The importance of this matter to our fruit growers induces us to publish the following letter, which originally appeared in the *Manchester Guardian*:—

"I noticed in the *Daily Telegraph* yesterday a letter from Mr. MARK SANDFORD, the Pond Farm, East Peckham, in which he said:—'I sent to Bath this week about 25 lb. of Plums, worth in London possibly 2s. This morning I received a telegram that the consignee refuses to receive them in consequence of the railway charges, 5s. *od.* A similar lot may come from America, I am told, for 8*s.* Is it possible for English fruit growers to compete with such unfair, one-sided competition?'"

"Without adopting Mr. SANDFORD'S conclusions as to the responsible cause the facts themselves surely do call for immediate and united action in a matter of so much moment in these days when the problem of agricultural depression is so constantly before the public mind, and when the subject of food for the people is one which is forcing itself with hungry clamour upon the public ear with a terrible persistence. Our dietetic errors and the thriftless habits of a large proportion of our superstitious population carry doubtless a fearful responsibility, but surely there should be some plan by which home-grown produce could be placed in the markets of towns within a few scores of miles of the fruit-growing centres at something less than eight times the cost of conveyance of similar produce—brought, I presume, miles across country—over the Atlantic and on to the home markets to which such consignments may be made. English fruit-growing, as applied to hardy British fruits, ought to have a grand future, but it must not be subjected to ridiculous conditions. There should be persistent education and determined organisation to secure results commensurate with the importance

of this subject, as affecting the future welfare of the nation and its peoples.

"The population ought to be better instructed as to the dietetic value of fruits. In many houses the contents of the fruit basket is regarded as a prelude to cholera morbus. Combined action ought to be taken in the matter of cost of transit and facilities for rapid delivery. Organised effort should be persistently directed towards the establishment of centres of sale, whereby growers might ensure some more profitable return and purchasers be placed upon more favourable terms than present arrangements seem to permit.

"There are many other points of detail that suggest themselves, but your space, I fear has already been too far encroached upon. EDMUND J. BALLEW.
"Chester, September 15, 1886."

— PRACTICAL LESSONS IN GARDENING.—Our recent leading article on this subject has brought us the following letter, which we print in the hope of stimulating some competent gardener to undertake the task. This is a matter that some of our prize essayists should be competent to undertake for a fitting remuneration:—

"The following is an extract from a letter received from a gentleman who has recently joined our Association:—

"This is a great village for gardens, and I think the suggestion made in the *Gardener's Chronicle*, of lectures on gardening, good. If you could guarantee a thoroughly good man to lecture, I would try and see what could be done to organise a circuit in this neighbourhood."

"The writer is the Rev. F. A. WOODHOUSE, of Gotham Rectory, Kegworth, Derby. Do you know of anybody used to this kind of work? and, if so, would you put us in communication? *Fishard Owen Greening, Managing Director, Agricultural and Horticultural Association, Limited, 3, 35, & 37, Strand, London, W.C.*"

— SEEDLING FIGS.—The discussion on this subject has elicited the fact, that seedling Figs do come up in this country, but in the majority of cases they are derived from imported Figs. One or two cases have been recorded wherein it was very probable that the seedlings originated from English grown Figs, but so far only two cases have been recorded where there was direct positive evidence that this was the case. A well known botanist and cultivator sends us seeds which look as though they were perfect, but on cutting them open the embryo is seen to be shrivelled and abortive. So far, then, Count SOLMS and Mr. HEMSLY are amply justified in their statements, but both are too good botanists not to admit that exceptional instances may occur, just as Cucumber flowers occasionally occur, with stamens and pistils in the same flower.

— FLOWER SHOW ARRANGEMENTS.—Messrs. ROBERT VEITCH & SON, of Exeter, obligingly send us photographs showing the manner in which their plants were staged at the late exhibition of the Devon and Exeter Horticultural Society. We shall probably publish one or more of these illustrations at a future time. Meantime we congratulate Messrs. VEITCH on the success of their arrangement, which must indeed have been a delightful change from the wearisome monotony of ordinary flower shows. Instead of showing them in tiers in the conventional mode, they built an imitation rockwork, introducing, in miniature, grottoes and caverns with mirror pools. By this means they were able to exhibit, in a natural-looking position, many trailing plants and creepers, and aquatic plants which are seldom seen at a horticultural exhibition. Suspended here and there from jutting rocklets and boughs were ornamental lanterns, which, when lighted up at night, gave a charming and picturesque effect.

— NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.—The annual meeting of this Association was held on the evening of Friday, the 17th inst., in the Christian Institute Hall, Aberdeen. The President, Mr. PETER HARPER (Duthie Public Park), occupied the chair. There was a large attendance of members. The annual reports from the Secretary and Treasurer were submitted, and showed a satisfactory and prosperous state of affairs. During the past year it appeared that twenty yearly members and one life member had been added to the membership of the Society; three First-class Certificates and ten Cultural Certificates had been awarded, and twenty-one papers treating of horticultural and scientific subjects had been read. The financial statement showed a balance

in favour of the Association of £32 9s. 10d. Mr. A. ROBINSON, Market Street, Aberdeen, was elected President, in the room of Mr. HARPER; and Mr. A. GRIGOR Vice-President for the ensuing year. Mr. WILLIAM REID, 8, Hadden Street, Aberdeen, was reappointed Secretary; and Mr. WILLIAM WYLLIE, Market Street, Treasurer. Committees were formed, and other formal business transacted. A cordial vote of thanks to the retiring President ended the proceedings.

— AGRICULTURAL LECTURES.—A course of lectures on agriculture will be given at the City of London College, White Street, Moorfields, E.C., on Tuesday evenings, at 7 P.M., by Mr. BERNARD DYER, F.C.S., F.I.C., Consulting Chemist to the Essex Agricultural Society, Devon County Agricultural Association, Notts Chamber of Agriculture, &c. The course of lectures will treat of:—

1. *Soils*.—Their formation and variations in character—Distribution—Classification—Chemical constituents—Causes of fertility.
 2. *Plant Life*.—Its influences—Sources from which crops get their food—Plant food in the soil—Active and dormant matters in soils—Composition of farm crops—Influence of the mechanical condition of the soil on plant life.
 3. *Manure*.—Farmyard manure, its production, its fermentation, its composition and character—Good and bad management—Action of manures in the soil—Artificial manures: salt, lime, chalk, &c.—Their mode of use and special properties.
 4. *Plough Operation*.—Mechanical and chemical changes—Influence of atmospheric agents—Drainage of land—Influence on its temperature, and on the health of stock—Choice of crops—Rotation of crops—Advantages of good cultivation.
 5. *Live Stock*.—The economy of good stock management—Special requirements for making land either a good dairy farm or a good sheep farm, or good grazing land.
 6. *Food*.—Chemical matters present in various kinds of food: in milk, green food, hay and corn, &c.—The different materials necessary for the growth of the body—Maintenance of heat—Process of fattening animals.
- The fee for the course (October to May) is only 7s. 6d. The Saddlers' Guild offer a prize of £5 5s. to the student who passes the best examination in chemistry and agriculture.

— ORCHID SALES.—Last Tuesday and Wednesday, September 21 and 22, the celebrated Fernfield collection of Orchids of Dr. PATERSON, Bridge of Allan, was sold by auction by Messrs. PROTHROCK & MORRIS, at their sale-rooms in Cheapside. The largest sum paid for a single plant at this sale was £47 5s., for *Cattleya Trianae*. A fine plant of *Laelia elegans* Turneri was sold for £39 15s. For one plant of *Odontoglossum crispum* as much as £33 12s. was paid, and £32 11s. for *Vanda suavis*. Among other good prices may be mentioned *Colonye* Gardneriana, £16 5s. 6d.; *Cypripedium Vetchianum*, 15 gs.; *Cattleya labiata*, 18 gs.; *Laelia Perrin* labi, 20 gs.; *Vanda Cathartii*, 15 gs.; *Cymbidium Lowianum*, 13 gs.; *Vanda tricolor* Patersoni, 16 gs.; *Odontoglossum crispum*, £14 3s. 6d.; *Dendrobium Ainsworthii*, 13 gs.; *Vanda suavis*, 14 gs., &c. The total number of lots was 742.

— GARDENING APPOINTMENTS.—Mr. ALFRED BISHOP, late Head Gardener to Mrs. DAVIDSON, of Abbotsford Park, Burgess Hill, Sussex, has succeeded Mr. WICKSON as Head Gardener to R. BURRELL, Esq., Westley Hall, Bury St. Edmunds.—Mr. GEORGE TESTER has been engaged as Head Gardener to H. G. BAINBRIDGE, Esq., Malvern Hall, Solihull, near Birmingham. He was lately Gardener at Packwood Gate, Knowle, in the same district.—Mr. C. CHIDLEY, late Gardener to C. NORRINGTON, Esq., Abbotsford, Plymouth, has been engaged as Gardener to W. CURRIE, Esq., Fallapit, South Devon.

YAMS IN THE WEST INDIES.

THE root crops, often termed "bread kind," associated with the above plants are largely used in the West Indies for food purposes. The sweet Potato (*Batatas edulis*) is the main food crop at Barbadoes, where Yam is little known, whereas at Jamaica the converse is the case, the Yams (*Dioscorea*) being very largely grown all through the interior hills, while the cultivation of the sweet Potato is confined to a few places in the lowlands. Since the large emigration of negroes to the Isthmus of Panama there has arisen a considerable trade in Yams between Jamaica and Colon, to the manifest advantage, in present cash returns, of the former country. Unfortunately, the cultivation of Yams entails the cutting down of forest year by year, as good Yams seldom do well, in the manner cultivated at Jamaica, except by the "rotation of land"—a peculiar negro mode of interpreting the European idea of "rotation of crops." Hence it is not very desirable, from a general economic point of view, to extend or encourage the cultivation of Yams. With the sweet Potato, however, it is different. This tuber can be grown without the sacrifice year by year of valuable virgin forest, and it is, in many respects, a crop well adapted to all the lowlands, not only of Jamaica, but also of the West Indies generally.

Besides being utilised directly for food purposes, it would appear that a new demand is likely to arise for the tubers of the sweet Potato in connection with the production of alcohol. The first notice of the sweet Potato being utilised in this manner appeared in a report to the Foreign Office given by Consul Hiertset on the trade and commerce of the Azores for the year 1884.

Owing to a variety of causes it appears that cultivators at St. Michael's and other islands of the Azores, who had hitherto looked upon Oranges as their staple production, were so disheartened by low prices and the diminished crops yielded by their trees that they resolved to clear their land of everything and plant it afresh with sweet Potatoes. The whole of the crop thus raised was used in the preparation of alcohol. During the year 1884, 1826 pipes of alcohol, of the value of £40,588, made from sweet Potatoes, were exported from the Azores to Lisbon; and, as will be incidentally shown later, the trade has assumed still larger proportions.

For the information contained in this article we would mention at the outset that we are indebted to Mr. D. MORRIS, late Director of Public Gardens and Plantations, Jamaica, now of the Royal Gardens, Kew, who has obligingly placed it at our disposal for the use of West India planters.

Encouraged by the success of the enterprise at the Azores it appears that an enterprising French chemist, Mons. A. Ralu, having much experience in chemistry, as connected with distillation, and possessing extensive relations with the West Indies (Martinique), has taken out patents:—1, For utilising as a commercial and industrial substance sweet Potatoes and Yams by means of desiccation and conversion into flour; and, 2, for distilling alcohol from the above flour.

In relation to the ordinary or Irish Potatoes, white Beetroot, and Maize flour, sweet Potatoes possess an alcoholic richness of 15.50 per cent. as compared with 8 and 9 per cent. of the Irish Potato, and 4 and 5 per cent. in the Beetroot. The value of raw sweet Potato for distillation, and its superiority, both as to quantity and quality, over other substances, has been for some time known and recognised. The difficulty has been in extracting the alcohol on the spot; added to this, there is the danger attending its exportation, for it is impossible to prevent leakage, and the vapour of alcohol at 95° Fahr. in hot climates is said to be inflammable. Alcohol, therefore, is assumed to be a dangerous cargo. As alcohol cannot, it is supposed, be made on the spot and exported to Europe, Mons. Ralu's patents aim at the preparation of sweet Potato flour in the West Indies, from which afterwards the alcohol may be distilled and utilised in Europe.

As already noted, one establishment for distilling alcohol from raw sweet Potato exists at the Azores, and we gather that since it began work it has doubled its plant, and all the alcohol it produces is sold in advance at Lisbon, where it is used for the fortification of wines. M. Ralu says:—"The alcohol of which we have specimens is superior in quality to the best marks of France. The distillery obtains 12 per cent. (i.e., 12 litres of alcohol at 100° per 100 kilograms,

of sweet Potato) of alcohol. We have experimented with the sweet Potato of Algeria. They give 13.4-10 litres of alcohol per 100 kilo. The sweet Potato of Martinique and Brazil have given 15 litres. There is here, therefore, a very rich material for distillation. Ordinary Potatoes yield only 3 litres of alcohol per 100 kilo.*

The objects sought by M. Ralu's patents involve the extensive cultivation of the sweet Potato in the West Indian Islands, its desiccation by means of fruit driers, its reduction into a meal, and its export to Europe, where an almost unlimited demand exists for sweet Potato meal for distilling purposes. The alcoholic richness of the sweet Potato is unquestioned, and the following table will give its superiority over the cereals ordinarily employed at present for distilling in Europe:—

	Francs.	Litres.
Wheat	10 75 to 21 50	28 to 30
Rye	15 50 to 16 25	22 to 23
Barley	17 75 to 20 00	24 to 25
Oats	17 25 to 19 50	20 to 21
Buckwheat	16 00 to 17 00	24 to 24
Maize	14 00 to 14 50	28 to 30
Rice	18 00 to 20 00	30 to 33
Sweet Potato flour	14 00 to 15 00	38 to 39

Maize, it will be seen, is the only cereal which is as cheap as the Potato flour, but it requires 324 kilo. (714 lb.) of Maize to make one hectolitre (22 gallons) of pure alcohol, whilst it requires only 235 kilo. (519 lb.) of the flour to make the same amount of alcohol. There is a great saving of time and combustibles when distilling from the flour, as compared with the Maize. Alcohol from Maize costs 10 francs per hectolitre more to make, and when made sells at from 8 to 10 francs less than the alcohol made from the sweet Potato flour.

The question for the planter, however, is, Will it pay to grow sweet Potatoes and to prepare the flour for export purposes?

The sweet Potato at present cultivated in Jamaica is mostly intermingled with other plants in the provision grounds of the negroes. Hardly any is cultivated by Europeans. No definite area is returned as exclusively devoted to this cultivation, and no returns of yield per acre are available from authentic sources. A negro in the same ground will have Yam (Dioscorea), Corn (Maize), Sugar-cane, and possibly, also, two or three other plants, such as Bananas, Plantains, Cocos (Colocasia).

Sweet Potatoes thrive best in rich friable soil free from clay.

At the foot of the Liguanea Hills, and, indeed, in most localities with the soil indicated above, they are found to thrive. They are easily propagated by slips or portions of the stem planted in rows or in hills. The roots come to maturity in three or four months, and the cultivation is continued by covering up the stems when digging up the more perfect roots for use.

The crop comes in practically all the year round: there is no regular season for it, and hence it can be best harvested by examining the state of the roots, and taking out those that are found perfectly ripe. The crop may be gathered at least three or four times in the year; but as to the amount or value of each cropping no data are immediately available.

If the cultivation were undertaken by sugar planters, and large areas were planted with sweet Potatoes, there is no doubt that in Jamaica they might be grown as advantageously and as successfully as anywhere.

We apprehend that few of the West Indian islands would care to grow sweet Potatoes to be utilised simply in the manner indicated by M. Ralu. Why should they go to the trouble and expense of drying the tubers, reducing them to a meal, and export the latter to Europe to be there converted into spirit? If the whole process can be accomplished at the Azores there is no reason why it should not be also accomplished in the West Indies. We say this with due regard, of course, to any patent rights held by M. Ralu or his friends. At least, it is well worth trying; and the number of sugar planters now on the look-out for something to supplement the meagre profits (or something worse) of a West Indian sugar estate should lead to some concentrated and united action being taken to examine and test everything having the slightest hope of aiding them at the present juncture.

In relation to its size, Barbadoes at present grows sweet Potatoes more extensively than any other West Indian island. They are grown as a catch crop between the regular intervals of planting the Sugar-cane, and are generally sold as they stand, the purchaser harvesting them himself. Here there would be no difficulty in growing sweet Potatoes on the most extensive scale commensurate with the size of the island; but there are no stills already in existence as in Jamaica, and both the plant and the knowledge of distilling would have to be introduced. Jamaica has the advantage in this respect, for every sugar estate

there has its still-house, and when once the *modus operandi* is known as regards this special industry it would be a very simple matter for the Jamaica planter to distil alcohol pure and simple from the sweet Potato, as for him to distil rum from molasses. The Barbadoes planter at present ships his molasses either to Europe or America, or sells it to the distillers at Martinique, where it is used in the preparation of French rum.

It is not our intention to advocate, in any decided manner, the preparation of alcohol from sweet Potatoes, or express a strong opinion either way. We only wish to point out to the West Indian planter a possible means, in these hard times, of meeting a demand which evidently exists for a certain article, and to throw out suggestions which may be of ultimate benefit to him.

At St. Vincent, for instance, where nothing at present appears to pay, a well-established industry connected with this method of utilizing sweet Potatoes might give the initial start to local enterprise and lead to a more prosperous state of things. Or, again, there is Tobago with its Métyer or *juari* co-operative system which might offer an excellent opening for an industry of this kind, provided, of course, it were taken up in a business-like and systematic manner and adapted to the special circumstances of the island. In fine, this is essentially a matter which commends itself for consideration to West Indian planters in general, and they would do well to look carefully into it. *European Mail.*

The Apiary.

SENDING HONEY.

ABOUT this time last year I mentioned the fact that before the advent of the Self-opening Tin Box

FIG. 2.—HONEY-BOX FOR POSTAL TRANSPORT.

Company, there was no known method of sending extracted honey with perfect safety by rail, certainly not by post. Lest that notice escaped the eye of any bee-keeper, I mention the fact again, and add an illustration (fig. 2). Since last year the sale of these tins has immensely increased, and they are used for endless purposes; but we have only to deal with them as far as the storage and carriage of honey is concerned. Many influential members of the British Bee-keepers' Association, and others interested in apiculture have given their favourable opinion unasked about these tins.

Everybody knows that even a box of sardines is not always easily opened, while larger tins of various articles are certainly opened with some difficulty. To get over this difficulty, the Tin Box Company invented a tin with a lid which is opened by leverage, and which can be lifted up by a penny. The lid fits so nicely that it is not only impossible for it to tumble off, but when pressed down into its proper place, the box is perfectly air-tight, and therefore very useful for all purposes where a perfectly air-tight vessel is required. This company, while keeping to the original principle, has improved its tins in many ways. I have one standing before me now which is a great improvement on those I had last year. It is made entirely without solder. There are only two pieces to each box, one piece for the lid, and another for the box itself. To suit the convenience of bee-keepers various sizes are made, and some tins holding $\frac{1}{4}$ cwt. were recently shown.

Two silver medals were awarded to this company at the recent large show in the conservatory at South Kensington in connection with the Colonial Exhibition.

WINTERING.

As September is now nearly run out, if not already done, look over all stocks at once, to see if they have enough food to carry them through the winter, and if not feed at once. All feeding ought to be completed before October commences. I would state that about 20 lb. of honey is considered a perfectly safe quantity. *Walter Chitty, Penryn.*

HOME CORRESPONDENCE.

Picea pungens glauca.—This charming though, comparatively speaking, little known species of Spruce Fir—better known in gardens as Abies Parryana—is now growing most luxuriantly in our York nursery, both in exposed and sheltered positions. One young tree has made a leading shoot during the present season fully 21 inches in length, the total height of the tree being only 56 inches, its longest lateral shoot produced this season being 9 inches. The soil where this tree is planted is rich sandy loam, and the position is a decidedly moist one, *Gentiana pneumonanthe* being in bloom close alongside. The variety *P. pungens glauca* also promises to be an equally hardy and rapid grower, and so far retains its characteristic feature well. Such a wet season as the one we have had will, no doubt, account in large measure for the unusually strong growth of the particular tree referred to above, but it is worthy of note that similar trees planted on higher ground, in drier positions and in stiffer soil, appear less vigorous in health. From the habit which this tree possesses of retaining its bud-scales until June, it proves itself to be one of the hardest species of Spruce Fir which we grow, and consequently one highly suited to our climate. It will, I feel sure, be much more generally cultivated as this quality becomes better known, seeing that it is proof against our latest spring frosts, as well as the most severe winter weather, our plants having stood uninjured during the last eight years. *F. Backhouse, jun., York.*

Crocus karduchorum, Kotschy.—I have at last obtained corms of this species which has heretofore been only known by a few dried specimens scattered through European herbaria, collected by Theo. Kotschy, on September 27, 1859, on a mountainous ridge between Mukus and Scherwan in Kurdistan. The corms I have recently forwarded were sent me last autumn by the Rev. A. H. Hubbard, American missionary, of Sivas, Asia Minor, but whether they were obtained near Sivas, or from the locality far to the east where Kotschy discovered the species, I have not yet been able to ascertain. The figure in my monograph of the genus *Crocus* (plate v.) which was drawn from Kotschy's herbarium specimens, fairly represents the plant, except that in colour the fresh flowers are a little bluer in tint, and each segment is veined with about nine fine purple lines extending half way up the segment, which were not visible in the faded dry specimen. *C. karduchorum* somewhat resembles *C. zonatus*, of Gay, but the flowers are smaller, and instead of the bright golden zone at the base of the inner surface of the segments above the throat, two small orange spots occur similar to those in *Crocus vallaicola* of Hebert. In Kotschy's specimens preserved in the Vienna herbarium the leaves pertaining to the previous vernal growth were preserved up to the flowering time in September—two years' sets of leaves, one dormant within the sheathing leaves, being present at the flowering time. This occurs in only one other species, *C. Scharojani* of Kuprecht. *George Maw, F.L.S., Benthall, Kenley, Surrey, Sept. 20.*

Allotment Land.—Conversing with a native of Nottingham who called upon me the other day, he said that for some time he had been allotment land round about the city, and that he had obtained the extraordinary price of rather rental annually of 2½d. the square yard, the which, if Nottingham yards are the same as elsewhere, means about 6s. per rod, or £48 per acre. It is surprising to learn also, such is the wonderful cultivation given, that even at this rental the allotments are made to pay. What a comment does this fact offer upon the doubts cast on the capacity of working men to cultivate allotments profitably! Not only does this case illustrate the extraordinary capacity of the Nottingham operatives to garden well, but it also displays the strength of that latent earth-hunger which is at the bottom of the recently formulated demand for small holdings and allotments. The fear expressed lest working men should fail as cultivators is hardly borne out by experience, for as a rule allotments, where the land is at all of decent quality, are invariably well cropped and productive. The labouring classes seeing land falling out of cultivation because farming on a large

scale has proved to be a comparative failure, do but ask that they may have a fair chance to try their fortunes as small cultivators. If eventually they fail, a problem will at least have been fully solved, but it is hardly fair that those who themselves have failed should endeavour to prevent others from trying in a diverse way. It is obvious that when agriculture, whether in large or small farms, fails us, then the country must soon shut up shop. *A. D.*

Chrysogonum virginianum.—I send a specimen of a North American Composite, little known in English gardens, but of great merit, *Chrysogonum virginianum* (Lin.). It is dwarf, having few stem-leaves, and a generally procumbent flower-stalk a foot long, on which flowers are borne in succession from June till the frost. It increases sparingly by runners, and is readily divisible. It never becomes weedy; and though yellow American Composite is a terrible character in the opinion of many, it does not look like a Composite. I had it first from St. John's Nursery, Worcester, and having grown it for two years can give it a very good testimonial. *C. Wolley Dod, Edge Hall, Malpas.* (An engraving is in preparation. *Ed.*)

Semi-double Cypripedium (figs. 83, 84).—As an addition to the series already published, we now give an illustration and plan of the floral arrangements in a flower of *Cypripedium superbiens* (Veitchii) kindly for-

rected hot weather has had something to do with perfecting the growths and setting the buds. When the pots are packed full of roots as these are, abundant supplies of water and sunshine in the same proportion harden the growths, and the buds are formed before the cold nights set in. Large quantities of *E. cafra*, *E. gracilis*, *E. melananthera*, &c., are also grown. *7. D.*

Herbaceous Plants.—What are we to understand by "herbaceous plants"? I find that at flower shows a very wide latitude is given to this term, and in a stand of "herbaceous cut flowers" I not infrequently see Clematis of the Jackmanni type, Roses, Pentstemons, Gaillardias, and other things differing somewhat widely in character. It is difficult for judges to disqualify unless they are prepared to give an authoritative definition of a "herbaceous" plant. I perceive that a writer in a gardening contemporary describes herbaceous plants thus:—"They differ from shrubby plants in the limited and less woody nature of their growth, and in dying down to the ground every year after they have flowered, and their leaves and stems have performed the functions necessary to their future well-being." Can this be accepted as a safe definition? If so, then Roses and Clematis should find no place in a stand of flowers of herbaceous plants. Taking flower shows generally, I should think, judging from the nature of the subjects shown

sionally treated to surface-dressings of soot. As all the plants are standing in the open ground it was necessary for Mr. Wildsmith to take necessary precautions against their being damaged by wind, and therefore he hit upon the plan of driving into the ground two stout stakes, one at each end of a line of some 50 feet; four strong wires are stretched from stake to stake, and against these wires the plants are placed. Each plant is supported by means of a long stout stake, not placed in the pots but into the ground behind the pots; the plants are secured to the stakes, and the stakes to the wires. They are so secure that no possible harm can come to them through being blown about by the wind. The height to which some of them have grown leads the visitor to wonder how the flowers will be gathered, but in a place where Vines are growing upon their heads instead of their roots, one need not wonder at anything being accomplished. Mr. Wildsmith is growing a representative collection, but chiefly in-curred Japanese and refined varieties. Where he will stow away all his plants when the time comes to house them, is enough to set any one considering, but it will have to be accomplished some way or the other. In addition, there is a fine lot of bush specimens of *Chrysanthemums* that will be valuable for decoration in the autumn and winter. It will be well worth a visit to Heckfield to see the *Chrysanthemums* in November, and at that time the terrace garden will be full of winter occupants, and repay an inspection also. *R. D.*

Narcissus viridiflorus.—I have just succeeded in flowering this species from bulbs I collected in the neighbourhood of Gibraltar in the autumn of 1883. I have been in doubt whether, like some other autumn-flowering bulbous plants, it has a double period of growth—an autumn growth of the flowering scape and a separate vernal growth of the leaves; but I am now satisfied that there is but one

FIG. 83.—TWO-LIPPED FLOWER OF *CYPRIPEDIUM SUPERBIENS*.

FIG. 84.—*CYPRIPEDIUM SUPERBIENS*.

Plan of flower:—s, Sepals; p, Petals; col, Column; a1, a2, lateral fertile stamens.

warded to us by Mr. James, Castle Nurseries, Norwich. In this flower the sepals, s, in the plan fig. 84 were in their customary position; there were four petals, p, the two lower ones being represented by pouch-shaped lips; so that in place of one lip there were two, placed side by side and evidently in the same cycle as the two upper petals. In this case, therefore, the lips cannot be considered as belonging to the staminal series. The column, col, with its shieldlike staminode, two lateral fertile stamens, a1, a2, and stigma, showed in this flower no deviation from the ordinary conformation. It is possible that the two lips may have arisen from the sub-division of one, but that could not be ascertained in the full-grown flower. *M. T. M.*

Erica hymenalis.—If the summer-flowering species of Cape Heaths have lost something in popularity during the last few years, the winter-flowering species seem to have gained. In Messrs. Low's nursery at Upper Clapton the plants in preparation for the winter supply take those by surprise even those who have had an intimate knowledge of the London trade in these Heaths for a quarter of a century. *E. hymenalis* is the principal species grown; there are 60,000 plants in 5 and 6-inch pots. The plants stand about 18 inches high from the surface of the pot, and many of them have from twenty to thirty stems, furnished the whole of their length with flower-buds. Messrs. Low's manager considers that the plants are finer this year than they ever were before. Doubtless the

as herbaceous plants, that anything almost that is hardy enough to stand out-of-doors all the winter is regarded as admissible, while some apply it to tender things such as the Gaillardia. Can you give a definition that can be safely accepted by judges, and clear away the doubts which exist in the minds of many, and especially in that of a *Perplexed One*. [We agree with our unnamed contemporary—Roses, Clematis Jackmanni, and Gaillardia, certainly are not herbaceous plants in the ordinary acceptance of the term. *Ed.*]

Chrysanthemums at Heckfield.—For two or three years past at least Mr. W. Wildsmith has proved himself a successful grower and exhibitor of *Chrysanthemums*, cultivating a select collection, and doing it well, as he does everything else in the gardening way that he takes in hand. Calling upon him a few days since I found that he has this season greatly extended his collection, and has now between 600 and 700 plants in pots, the larger part of them on single stems for the purpose of obtaining exhibition blooms. They were raised from cuttings taken in December and January; that they have done well is seen from the enormous stems they have made, their vigorous growth and large dark leaves, and the height to which they have attained. If all goes well, as there is abundant evidence to believe it will, some grand flowers should result. The plants are well looked after in the matter of watering, and are occa-

growing period in which flowering-scapes or leaves, or both together, are thrown up in the autumn, the leaves continuing to grow late into the spring; then with the hot weather comes the long period of rest from April or May to September. My potted bulbs, last year, continued to produce a free growth of leaves up to the end of last May. I then dried them off and reported about the beginning of August, standing them for about a month under the conservatory stage, and then removed them to a slightly heated pit in which leaves are being rapidly produced with the flowering scape. I can detect no difference of character or structure between the leaf and the scape, indeed it seems that the rush-like growths, call them leaves or scapes, are identical in their nature, the stronger growths only producing flowers. I believe the difficulty attending the flowering in cultivation of many autumn-flowering bulbous plants, e.g., *Narcissus viridiflorus*, *N. serotinus*, *N. elegans*, &c., is, that they are kept growing when they ought to be at rest, and that we often reverse and mix up their natural periods of growth and of rest in cultivation. *George Mason, F.L.S., Bentham, Kenley, Surrey.*

Peas, Telephone and other Kinds.—At p. 371 I was very pleased to see Mr. J. Rust's account of the Telephone Pea. I have grown it two seasons, and my experience is just the same as that stated by Mr. Rust. I shall not grow it again, and feel sure it will be out of cultivation in a few years' time. After growing the new Pea, Prodigy, sent out by Messrs. Veitch & Son (I had only one row of it this year) I can say it is the grandest Pea I ever saw, and that it has the largest and best filled pod I have ever seen. This is a distinct green wrinkled marrow variety, and is first-class in quality, a heavy cropper, and the plant a robust grower, and resists drought and mildew. It grows to a height of from 5 to 6 feet. When this grand Pea gets better known we shall hear but little more about Telephone. I will mention

a few of the best kinds I find do best here, and I sow 36 quarts per annum:—Early Sunrise, Linton's Alpha, William I., Criterion, Prodigy, Veitch's Perfection, Marvel, British Queen, Ne Plus Ultra, King of Marrows, and Sturdy. The last four named kinds I am picking daily, and am likely to continue doing so till the end of October or November if the season keeps mild. *W. Smythe, The Gardens, Basing Park, Alton.*

Classification of Dahlias.—I am glad you have called attention to the urgent necessity for a better classification of Dahlias. For some seasons past, and at local flower shows in particular, there has been a growing confusion between the two classes of show and fancy varieties. To be sure there is but little difficulty amongst practical men, and it is mostly the less experienced growers who fail to see where the one class ends and the other begins. One reason for much of the complaint lies in the fact that competitors accept the lists given in nursery catalogues, and are thereby led to place facies in stands of show varieties, or *vice versa*, without considering that when a fancy variety throws a self flower (which several varieties often do), the flower thus thrown is, of course, quite disqualified from being exhibited as a fancy. Even nurserymen are not blameless, for I find that Messrs. Keynes & Co., of Salisbury, and others to whom my attention has been drawn this season, catalogue Stafford Gem, a very old fancy variety, as a show Dahlia. I think your proposed new division of classes a much needed improvement, and one which would greatly simplify our catalogues. But in my opinion an even simpler classification would be to abolish the present divisions of show and fancy, and classify the Dahlias according to their prevailing colour. Thus we would have, say, whites, yellows, crimson, and purples, with all the intermediate shades grouped round their respective primary colours. Tipped and striped varieties would have to be relegated to the colour of which they showed most. *James Service, Massillonton, Plumfield, M.B.*

Fuchsia corymbiflora.—What has become of *Fuchsia corymbiflora*? I know many gardens all over Ireland, and only remember having seen it with Mr. Durlidge in the greenhouse of the fine old gardens attached to Trinity College, Dublin. Within the past few weeks I have been much around London, including Kew, the "Home for Flowers," &c., and cannot remember having seen it. The query is suggested by an old Irish gardener having told me of several places in the south of Ireland where, thirty years ago, he saw it, and tulipists dotted at every yard along an avenue as Irish mile long, and left out in the winter, merely covered with bracken. I know the latter will live through the winter, as does *F. corymbiflora*, but is it not a mistake to allow such good things to become so scarce? *W. J. Murphy, Clonmel.*

Delphiniums.—A collection of beautiful Delphiniums, shown by Messrs. Kelway & Son, nurserymen of Langport, at the meeting of the Royal Horticultural Society on September 7, scarcely got the recognition their beauty and distinctness deserved. There were fruit and Dahlias, and other things, in large collections, and these engaged the attention of the visitors to the exclusion of other things of a less imposing character. Some of the varieties from Langport were particularly distinct, especially those of a single and semi-double character, with large rounded petals and saucer-shaped flowers having a bold centre of white stamens. These took the eye at once; deep blue and violet with white centres went well together. I made a note of the following as represented by bold and massive spikes of a very showy character:—Her Majesty, semi-double, bright blue dashed with white, fine and striking; Nemesis, very fine and distinct single variety, deep blue, with white anthers, flowers large and bold; Aphrodite, deep azure-blue, large and fine; Rupert, greyish azure blue with white anthers, very fine; Nahamah, the outside petals deep bright blue, the inside bronzy-magenta, semi-double, very fine; Juno, exterior petals very bright blue, the inner petals blue shaded with pink, semi-double, very fine; Lord Carrington, blue, centre bronzy-pink, semi-double, very fine; Very Grand, deep purple-blue, with white anthers, very fine; and Shotover, pale blue, the centre slightly dashed with pink, white anthers, very fine. It would be a very easy matter to extend this list, and some fine older varieties might be added to it, such as *alopocarpoides*, *belladonna*, *celestinum*, *formosum*, *grandiflorum plenum*, *Keteleeri*, *Madame H. Jacotot*, *magnificum*, and the scarlet nuda-like variety that seedling delphiniums are not more frequently raised by the hardy flowerers. By sowing the seed early in the year in a little heat, and then growing the plants on into size as soon as possible, and putting them out-of-doors into a bed of good soil, they are made annuals, and a large number of these will bloom the same season. All the finer forms can be planted out at the backs of the flower borders, the inferior ones, not being worth keeping,

can be destroyed. When seed is saved a select few of the very best only should be allowed to mature a few pods, and the rest be cut away, as it weakens the plants if they are permitted to mature all the seed-pods they form. Slugs are apt to injure the plants in winter and spring; a dressing of soot will help to keep them at bay, and ashes about the roots form a barrier to progress also. *B. D.* nuda-like character; it needs a lighter soil, and it has the peculiarity of forming its corn-like roots near the surface; it is, therefore, a good plan to top-dress the plants occasionally with some light rich soil. *R. D.*

Clematis vitamba.—This plant luxuriates in a truly extraordinary manner in Normandy. On all sides the masses of its white flowers are to be seen during August. I should almost think it is a perfect pest off-tentimes, as in one instance when I saw it spoiling a fine Cornifer of about 20 feet in height by climbing all over it, and even webbing the upper branches to its neighbours. But at the same time its festoons of blossoms looked very pretty. This habit of climbing everywhere has its advantages, however, and one of the prettiest of sights was near Caudebec, where part of a hill had been cut away for the railway canal. This *Clematis* was about 10 feet high. The Clematis and a very few Brambles had taken complete possession here; not a single blank space was left. When this bank is in full flower what a grand sight it must be! It was late in August when I passed that way, and there were to be seen but the last few flowers—even that was fine; what, then, must it have been? *Le Voyageur.*

Wasps.—In reference to the remarks on this subject in p. 374, may I be permitted to say that here the "wasp season," from the end of June to the middle or end of September, is the garden men's "harvest," and an unprecedentedly bad one for them this season, as is shown by the sums paid for the nests when compared with the last four years:—1883, £10 2s; 1884, £53 9s; 1885, £45 3s; 1886, £12 10s. We pay 1s. per nest, the queen wasp being produced every week with each nest during the ten or twelve weeks over which the wasp season extends. The nests are taken as soon as they are counted. *H. W. Ward, Longford Castle.*

In the spring we had a large number of queens, and expected, in consequence, great annoyance; but we have very few, in fact, less than have ever been known. *Thomas Taylor, Bocking, Braintree, Sept. 24.*—This year the scarcity of wasps is remarkable, and more particularly as Pears and Plums are so plentiful. At the same period last year almost all fruit here was destroyed by wasps, if not protected, and we destroyed over 600 wasp nests within a radius of one mile round the gardens and park, and we have so destroyed them there for the last five years. Last year I noticed a great number of queen wasps in the Pine-stoves, vineries, and other glass-houses, and took great care to destroy them. I never remember having seen here, or in any other part of England, so few wasps and nests. I have only heard of five nests, and have not seen twenty wasps this month. I quite believe that most of our early nests of wasps are destroyed at day and night, the cold days and nights, and the heavy rains, which, no doubt, drowned hundreds of wasps. But it is most interesting to note that since we have had no wasps the bees have taken to devouring the ripe fruits—first the Gooseberries, and now the Plums are covered with bees, sucking their juices from them. *Wm. Smythe, The Gardens, Basing Park, Alton.*

Non-growth of Primula Seed.—I note the query on this subject at p. 372, and the sensible editorial advice to keep under proper conditions, as which will probably vegetate in the spring. I permit me to supplement this by advising Mrs. Abbot not to cast away the seeds as hopeless till the spring of 1888, as the finest lot of seedlings of *Primula japonica* I ever raised laid fully eighteen months in the soil before germinating, and several came up in the reserved seed-pans after two years. Possibly not a few good seeds of *Primroses* and other plants are lost through impatience. So many seeds come up quickly that we lack the patience to wait for the laggards, though why some seeds from the same sowing should germinate promptly, others slowly, and yet others, apparently equally good, not at all, is a problem that greatly needs further elucidation. Neither are the causes of the truth that has almost passed into a truism among cultivators, that the older the seed the longer in germinating, altogether obvious. Further, is this generally true as to enable it to rank as an absolute fact? I was much questioned in it. Though it is a long way from *Primroses* to Turnips, "A. D.'s" note on the slow growth of the latter from old seeds (see p. 371) has probably an important bearing on the question. The peculiarity of the Turnip case, as stated, is not the slow germination of the seed, but the slow growth of the plants afterwards, the progress of the plants from the old seeds being in his case so slow as to lose him the

season and the crop. This is a view, and from the cultivator's standpoint a vitally important view, of the correlation of age of seed to growth. It is also singular as confirming a fancy of the old cultivators that old seeds favoured fertility at the expense of mere extension or vigour. But these views, if correct, would have limited the top-growth and stimulated the bulb-growth of the Turnips, whereas in the case of "A. D.'s" Turnips the growth of the entire plant was so sluggish as to entail the loss of the crop. If this is possible in the case of Turnips of course it is equally so in regard to other plants, fruits, and vegetables, and may exert the most potent power on products or profits. *D. T. Fish.*

Tropæolum Lobbianum.—I have been astonished to find that the beautiful *Tropæolum Lobbianum* is so little known at the present day; indeed, it seems quite possible that, unless attention is called to its merits, it may soon slip out of cultivation altogether. It is catalogued by the London seedsmen, and something is sent out for it by the German seed-growers, but some at least of both of these classes know it not. What I buy for it in London is the common *T. majus*, and one at least of the German growers asserts that this is the true plant, and describes the difference between the two as consisting in the longer stems of what they call *T. Lobbianum*. *T. majus* is, I am told, grown largely for it as a market plant, and some country nurserymen I have learned, since my attention has been directed to the subject, call a variety of *T. majus* by this name of *Lobbianum*. I turned to some of the principal plant catalogues, such as Veitch's and Williams', it being one of our best cool and winter blooming climbers, but find no mention of it in them. I hope I have been exceptionally unfortunate in my search after so fine and ornamental a plant, not difficult to grow, and which, therefore, ought not to be uncommon. I find it is not now to be seen in some of our London public parks, such as Hammersmith Park and the Regent's Park, in both of which, I think, I used formerly to meet with it. Do try to rescue this handsome climber from undeserved oblivion. *M.*

Messrs. Backhouse's Rockwool. — Having often heard of this beautiful rockwool, I was fortunate enough to have a long-felt wish fulfilled when on a business tour this year in the North of England and Scotland I was enabled to pay it a visit. This piece of work so far exceeded my expectations, that I feel I must write a few lines concerning it in your columns, to induce amateurs of rockwool and alpine plants to go and see it as soon as they can, as I am convinced that they will be amply repaid for their journey. The rockwool is about 350 feet long, 200 feet broad, and from 20 to 35 feet high. It consists of immense stones put together in a way so as boldly to imitate Nature; a nice piece of water with shallow spits, in which stones are put so as to enable visitors to walk over them, greatly adds to its charm. The whole is planted with exquisite alpine Ferns, &c., the names of which are in the margin to enumerate. I can only say that during the whole year flowers of some kind are to be seen. It is a great pity that rockwools are so rarely met with in gardens, as they add a permanent charm to them. Besides the rockwool, Messrs. Backhouse's nursery is amply worthy a visit for the interesting collections of plants of all kinds. *J. M. C. Janszland, Coninck, Deelenaar, near Zwolle, Netherlands.*

Primrose Seeds.—Her Max Leichth's recommendation that *Primrose* seed should always be on the surface of the soil, without being covered up at all. Possibly, therefore, Mrs. Abbot's seed has been buried too deeply. *H. E.*

Strawberry Plants.—The demand for these is always so large that Strawberries are largely grown by some to produce "runners" for sale. Strawberry culture of this character is made a specialty by Messrs. James Carter & Co. at their Crystal Palace Nurseries, but they do not leave the runners on the beds till required for the execution of orders, as is the case with some, but they are taken from the beds as soon as large enough, and planted in good soil in cold frames, and being kept well watered soon grow into good plants, and make a greater headway than when allowed to remain on the beds. The task of executing orders is rendered a much lighter one, and it can also be done more quickly, and despite the weather, and when frost abounds the plants can be protected from its action in cold frames, and orders executed during its prevalence if necessary. *R. D.*

The Cedar at Breyth Park.—I was interested in seeing the engraving of the old Cedar in the Chelsea Botanic Garden, and erise you a photograph of the one here, which came to England, it is believed, at the same time as the Chelsea tree, and the late Countess of Chesterfield used to say that according to some old documents in the possession of the family it was planted in 1676. The tree is very lofty and

robble looking. *G. Brunt, gr.* [The photograph obligingly sent by our correspondent shows that the bole divides into two main divisions at some considerable height from the ground, and that the branches spread mostly in a horizontal direction; some seem to have been lost by weight of snow or other cause, and others are covered by chains. It would be of interest to know the girth at 5 feet from the ground and the height. Ed.]

Leycesteria formosa.—The behaviour of this plant in Britain, according to the testimony of several writers and authors, has been disappointing, or the reverse of satisfactory. Those who have seen it in its Himalayan home speak of the high coloration attained by the bracts and berries. When first cultivated in the Edinburgh Botanic Garden it was grown in heat, and flowered in 1838, but, as might be expected under such conditions, the bracts were pale and unattractive, the leaves far thinner, and more cut. Farther north in the open shrubbery the plant is generally killed down in winter, but as summer advances it sends up long, hollow, Willow-like shoots, that frequently flower freely enough, but the bracts are green, or slightly tinged with purple, and altogether too pale to afford sufficient contrast to the white or pale purplish flowers. Its hardness there is very severely tested. In the neighbourhood of London it flowers freely enough, and even fruits, but in most cases the inferiority in above-mentioned cases. Wherever I have witnessed it, however, in maritime localities, there is a marked difference in the coloration of the bracts; whereas the usual colour inland is green, more or less tinged with dull purple, especially that of the upper and smaller bracts, at Sanderson's in Pembroke-shire the bushes in the villa and cottage gardens attain a height of 5 or 6 feet, while the large bracts of the terminal, drooping, or tasseled-like inflorescence acquire a deep bluish-purple of remarkable richness in tint. In the lower and older part of the inflorescence berries begin to form and gradually acquire a reddish-brunish colour that deepens almost to black, while at the tips of the shoots the berries are still small or flowers even may be present. The same remarks apply to plants in shrubberies at Ventnor, in the Isle of Wight, and in cottage gardens at Battle, in Sussex. In these latter places the beauty of the fruit and inflorescence argues in favour of a more extended cultivation than it even now enjoys, and planters would do well to give it a sheltered but sunny, open position, in order to obtain the highly desirable coloration, even in spite of the fact that it grows in Oak and Pine forests at an elevation of 6000–8000 feet in its native home. It has been recommended as a covert plant where pheasants are reared, and which are fond of the berries. Whether or not it ever attains any popularity from this economic point of view is certain, but it deserves a trial under different conditions in order to test fully its character as a decorative shrub. London must have been mistaken (*Trees and Shrubs of Great Britain*, p. 543) when he stated that the berries are equal in size to a common sized Gooseberry. They are oval in outline, but more comparable in size to that of a Pear. Fortunately the plant is easy to propagate from cuttings in a growing state, or after the shoots are tolerably ripened, and usually within six weeks by means of the cuttings as to soil provided it is moderately rich and well drained, while a dry or sandy soil would probably promote a richer coloration of the bracts. The figure in the *Botanical Magazine*, t. 3699, is fairly representative of the species, but fails to give an impression of the intensity of coloration attained by plants growing in maritime localities. 7. F.

Cucumbers.—It is worth asking why it is that the popularity once so strongly shown in favour of smooth fruits now seems almost invariably given to spined or spineless kinds? It cannot be said that in making this change nothing is gained by the consumer. We have nothing added in the way of flavour or in texture of flesh; we have nothing added in the way of prolificacy. We get perhaps rather more of beauty if perfectly smooth fruits are more beautiful than are prickly ones, and also rather more of length, but beyond those features nothing seems gained. Very probably it will be found on inquiry that to exhibitors do we owe this change more than to any other cause. Naturally they would favour smooth kinds of fruits because they have a prettier appearance. It is rather odd that whilst we eat both Melons and Cucumbers in the raw state yet we almost invariably make it a condition that the former shall have good flavour, or at any rate select those for prizes showing best flavour, whilst Cucumbers are judged by length and appearance alone. If, as often happens, the finest and handsomest of Melons in a competition are the worst at all, might not the same thing happen in a competition for Cucumbers? Again, it is the rule to place Melons upon the dessert table whole, and naturally a handsome looking one makes an attractive feature. Cucumbers, on the other hand, rarely

appear on the table in a whole state; indeed, those who partake of them at table, probably seldom see them whole, and yet we in our judgments absolutely reverse the order of things by giving prizes to Melons for flavour regardless of beauty and to Cucumbers for beauty or smoothness in a fruit afforded no criterion as to the relative cropping properties of the kind it represents. It may be that the plant which produced it stops at ten or twelve fruits, whilst another shorter kind will produce three times as many fruits. What gardener is there, after all, in spite of the prize-winning value of the first-named kind, who would not prefer the same prolific plant because it would enable him to fully satisfy the demands of his family. Judges who demand to taste Cucumbers in order to ascertain flavour and very naturally so, as it would prove an exceedingly unpleasant duty, and still farther not a few, owing to vitiated tastes, are unable to discern the true points in flavour found in many vegetables. None the less, if the flavour test may not be applied, why should they invariably go for large fruits? It is true I have met with some exceptional judgments, but even then only when larger fruits have been sold or ill-shaped; still the general practice remains to favour the longest kinds if they can be found in preference to shorter fruits. Long, straight, and smooth fruits invariably win; shorter, and specially spiny fruits are neglected. Now in growing Cucumbers I have been struck with the very prolific nature of that fine-spined kind, Blue-gown, one of the best, deepest coloured, and most prolific of all the family. As compared with long smooth kinds the former throws fruit not merely at almost every joint, but in many cases two, three, and four fruits are clustered at a joint. Of course so many cannot be left, but ample evidence is thus given of its prolific qualities. Then Blue-gown, as its name implies, is of a deep bluish-green colour, and, farther, carries what so few of the smooth kinds do—a dense bloom on the surface. That may or may not be evidence of quality, but at least it is a pleasing feature, because it exhibits good cultivation. If Cucumbers were eaten in their skins no doubt the prickly spines found in Blue-gown and similar kinds would be very objectionable, but cucumber coatings are indigestible, and invariably removed before the fruits are served up. We have new, or what are called new, Cucumbers offered in trade from time to time, but few indeed now present any special features of interest or novelty. In smooth kinds Telegraph, if a good selection, still furnishes fruits which satisfy the description of a dozen others, and what is peculiarly noticeable in any special cucumber competition, that rarely do any two of the samples shown in the class agree in character. If all are *bona fide*, then does this fact illustrate the not unknown erratic nature of many so-called distinct kinds. In reference to this matter it is certain that Blue-gown, amongst the spiny section, not only comes always true, but can easily be distinguished. I hope in this drawing attention to its obvious merits I may not assist in its re-baptism. A. D.

Mr. Laxton's New Peas—Charmer and Walton Hero.—I have grown these Peas under most favourable conditions, and with very satisfactory results during the present season. Charmer attained to a height of 5½ feet, the plants being heavily laden with large handsomely curved pods, each containing on an average nine Peas of excellent quality. It appears to be less liable to the attacks of mildew than many of the older varieties are; the pods are dark green, heavily covered with bloom, are quite distinct from any other variety that I am acquainted with, and I consider it an acquisition to the already long list of Peas in cultivation. Walton Hero is the result of a cross between Telephone and British Queen. In habit of growth, size, shape, and colour of pods which are produced too thinly on the haulms to please me, it partakes strongly of Telephone. H. W. Ward.

Cranberries and Cowberries.—Is there any way of distinguishing at sight or by taste the berries of *Vaccinium vitis-idaea*, commonly called Cowberries, or *Wortlieberries*, from those of *V. oxycoccos*, the Cranberry proper? A lady sends me from Inverness-shire specimens of *V. vitis-idaea*, with ripe berries, saying that they are locally called Cranberries. Basketsful of small scarlet berries are sold in Lowersness market in the middle of September as Cranberries, which I suspect to be the fruit of *V. vitis-idaea*. I have seen *oxycoccos* growing plentifully in wet moors in Dumfriesshire, and also in Perthshire, but I do not think it is common in the more northerly Highlands. Perhaps some correspondent who knows the Highlands and the plants well will tell me. C. Wolley Dod, Edge Hall, Malpas.

German Moss Litter for Orchids.—I advise Mr. H. J. Buchan (p. 371) to have no hesitation to do with this as a material for potting Orchids. I have seen it, or something of the same nature, experimented

with for the purpose in several places, and although the plants, and especially fresh imported ones, seem to take to it well at first, in a little time it gets sour, rotten, and slimy, if kept wet, and next to impossible to wet without soaking, if once allowed to get dry, in either case ruining the plant in the end. During my time I have tried Cocoa-nut fibre and other things, but never found anything so good, but peat or broken fibre and sphagnum moss, and these would be cheap at higher rates than they now command in comparison with any other stuff, such as Gisman moss litter. James O'Brien.

Reports of Societies.

ROYAL HORTICULTURAL :

September 21.

THERE were no competing classes at this exhibition of the Royal Horticultural Society, the occasion being merely the meetings of the Fruit and Floral Committees. The display of flowers was very large, consisting principally of Dahlias and Gladioli, with other herbaceous plants. A great number of new and interesting plants were also shown. Apples constituted the chief feature of the exhibits which came before the Fruit Committee.

Floral Committee.

Present.—G. F. Wilson, Esq., F.R.S., in the chair; Messrs. J. Douglas, T. Baines, Shirley, Hilder, G. Paul, W. Holmes, R. Dean, H. Ballantyne, J. Dinning, H. M. Pullett, A. S. Lendy, J. O'Brien, H. Turner, H. Cannell, W. Wilks, C. Noble, J. Hudson, H. Bennett, G. Duffield, Dr. M. T. Masters, and Amos Perry.

Among the principal objects shown were—

Croton var. Lalandi.—Some nice specimens of this were shown in pots by Messrs. Shirley, Hilder, and the common *Pyrantha*, but produces berries earlier and, if possible, more profusely, especially if worked on the Queen. Its berries are rather more orange-coloured, and the leaves somewhat narrower than in the type.

Onoclea striatipes.—A Fern with flat, obtusely tri-pinnate fronds of leathery texture, the ultimate segments broadly oblong-obovate.

Mirabilis eminalis (Hort., Ball.)—A form with stalked oblong leaves, with a greenish-cream coloured ground, on which are scattered transverse oblong blotches of deep green colour of different sizes, and sometimes connected with the midrib by short slender processes of the same colour.

Cepolepis discolor.—This is a stove shrub or tree, with large pendulous oblong-lanceolate acuminate leaves, the younger ones of a pale chocolate-creamy colour. It was suggested that this might be a species of *Grias*.

Saxifraga tessellata.—A handsome Clad-moss, with erect four-sided branches, and flat deltoid fronds.

Panicum jagou.—A stove shrub, with highly decorative foliage, having shortly-stalked opposite lanceolate leaves of a deep velvety green colour with a black midrib.

Panicum guianense.—A species whose flowers have very narrow reflexed segments.

Cerium fissellii, shown by Sir Trevor Lawrence, and remarks that not only for its handsome flowers, but for its hardness. The flowers are broadly funnel-shaped, white flushed with rosy-lilac, and borne in a truss of six, eight, or even more flowers.

Cyrtanthus hybridus rostr.—Several plants of this were also shown by the President of the Royal Horticultural Society. They are the progeny of a cross between *Valloia purpurea* and a *Cyrtanthus*, and vary in colour, those shown were of a rich rose colour.

Cyperopodium Sanderianum.—A remarkable Cyriped, with an upper lanceolate sepal, a smaller lower one, two narrow petal-like brown petals protruding into long tails, a long lip of an olive-brown colour with a long stalk compressed from side to side, and with the column provided with a very long spade-like staminate. Veitch.

Troscus palmata.—An Aradid, with spiny stem, and deeply palmately 7-lobed green leaves, the lobes oblong-lanceolate, serrulate. Veitch.

Carcum sumatran.—A species with long-stalked, oblong, phate leaves, and erect flower-stalks provided with concave, shell-like spreading bracts of a reddish colour.

Rhododendron King of the Yellow.—One of Messrs. Veitch's novelties, in the way of the so-called greenhouse Rhododendrons, and bearing a truss of yellow, faintly coloured flowers, of good form and substance.

A *Rose Perfum.*—Another hybrid Rhododendron, with pale rose flowers.

Saxifraga gracilis.—A Clad-moss, with slender cylindrical upright stem, thinly beset with small scattered appressed leaves, and flat bipinnate leaves, the pinna linear-lanceolate, with rosetts of densely packed fine leaves. Veitch.

Grammatophyllum Elleri.—A massive looking Orchid, with square pedicels and a raceme of numerous flowers of triangular outline, the segments thick, oblong, yellow, densely spotted with minute brown spots.

Elm.—*Potamois pedunculata*, very pretty weeping Elm.—A Elm it be—with long slender pendent branches and alternate rough leaves, equal at the base (not

oblique as in most Flans, and crumpled, coarsely toothed margins. This is a most distinct and handsome form, apparently like the Japanese U. Kaki. The regularity of the base of the leaf is common in some species of Elm.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had a very large and heterogeneous collection of hardy herbaceous flowers, which included a great quantity of Dahlias, chiefly noticeable among which were those of the Cactus type, which were shown in many varieties nicely grouped in a sort of "ribbon" pattern. The singles also were very good, especially some of the double and ruffled plants were grouped together in boxes, and well displayed by the fine and elegant foliage of Asparagus, which is well suited for such work. *Lilium auratum* was also well represented, and the same may be said of *Asters* of the *Michauxias* Daisy type. A few traces of *Phlox Drummondii* var. were also shown.

Messrs. Paul & Son, Old Nurseries, Cheshunt, also contributed a large collection of hardy herbaceous cut flowers. The group from this firm was very varied in character. The most noticeable plants were Dahlias, but these were not presented. We must also specially mention *Crocuses*, *Polygonum cuspidatum*, and *Stachys latifolia*. Other plants were *Physostegia speciosa*, hardy *Cyclamen*, *Potentillas*, *Anemone japonica*, *Campnula piliflora*, several *Composites*, &c. From the same firm came a collection of ornamental trees and shrubs in cut specimens.

FLORESTA'S FLOWERS.

Although no formal prizes were offered at South Kensington on Tuesday last, there was, in addition to the subjects submitted to the consideration of the committee, large contributions from nurserymen and others that completely filled the staging round the sides of the spacious conservatory, and greatly delighted the visitors to the "Colindres." Foremost was a unique collection of 100 spikes of *GLADIOLUS*, shown by Messrs. Kelway & Son, nurserymen, Loughton, nearly all varieties of the own raising, and some of the most beautiful, viz. *Countess of Craven*, *Pulcherrima*, *Duchess of Edinburgh*, *Abada*, *Lady Macfarren*, *Mrs. W. Marshall*, *Earl of Airlie*, *Sir S. Northcote*, *Lady Salisbury*, *James Kelway*, brilliant crimson, with white throat; *Lord Allington*, Duke of Edinburgh, also crimson, also cut blooms of fine *Calliandra*, prominent among them were *Agnes*, yellow, with dark centre; *St. Blaise*, dark centre, with narrow edge of gold; and *Alonzo*, dark centre, with broad margin of deep yellow; also some fine quilled *Asters*.

DAHLIAS were largely shown, the fine open flower having so largely contributed to prolong their beauty. Messrs. Rawlings Bros., Romford, had a varied collection, including several seedling show varieties. A First-class Certificate of Merit was awarded to Queen of the Belgians, a charming show variety in the way of Mrs. Gladstone, but with a little more pink in it, and a white tip, good form, and very compact, eighteen blooms being shown. They also had Robert Pittfield, lively orange-red; R. J. Rawlings, a good useful yellow; T. S. Ware, wine-crimson; Mrs. David Saunders, pale purple; J. T. West, yellow ground, edged with blue; and a variety of purple—a good and promising variety; Bryan Wynne, bright crimson; and Miss Shelfield, a fancy variety, yellow ground, edged with blush, and flaked with crimson. Also a stand of twenty-four bunches of pompon, and four stands of show and fancy Dahlias, among the former being good blooms of R. J. Rawlings, Shirley Hibberd, Joseph Green, John Standish, Hugh Astin, Mrs. Gladstone, Prince of Denmark, Prince Bismarck, William Rawlings, Rev. J. Godday, George Barnes (in a self form), Mr. G. Harris, and Harrison Weir. Fancy varieties: James Ford, Peacock, Rev. J. B. M. Cann, Lotie Eckford, Henry Eckford, Professor Fawcett, Duchess of Albany, and Chorister.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, contributed a large and varied collection of Dahlias, some bunches of the green form, also shown by Mr. Ware, appearing to engage the attention of visitors to the exhibition more than anything else in the conservatory. Of show Dahlias they had good blooms of Mrs. Langtry, Mrs. Gladstone, Miss Cannell, James Huntley, Royal Duke of Windsor, George Clibbett, Grosvenor, and Ace-Ferris, Duke of Edinburgh, Georgiana, and Rosetta; and of fancy varieties—Peacock, Richard Dean, John Lamont, Mrs. Carter, Florence Stark, Rev. J. B. M. Cann, A. F. Barron, George Brown, and Mons. Chauvrière of pompon Dahlias, including varieties of Cupid, Lightning, Guiding Star, Little Dear, Dr. Webb, Pure Love, Glowworm, The Khedive, Fanny Weimer, Coquette, Dora, Gem, Darkness, Dove, and A Hubner—a good representative collection.

Among the single flowers was The Quair, rich bright deep crimson—large, and of the finest form—awarded a First-class Certificate of Merit; Fairie Queen, Alha magna (Paul), a fine new white; Canterbury Tales, erise-crimson; Sunset, Helen, Mauve Queen, White Queen, Harlequin, Charlie, Lucy Ireland, Paragon, and Duchess of Westminster; also Cactus Dahlias, Gladiali, and cut Roses, among which R. mgosa, both as flowering and fruiting sprays, was a prominent feature.

Messrs. Henry Cannell & Sons, nurserymen, and Swanley, had a stand of new Cactus Dahlias, and First-class Certificates were awarded to the following two varieties:—Lady M. Marshall, pale red, full and striking; and Charming Bride, pale ground tipped with purple—large and pretty; also the following:—Lady Victoria, pale yellow, margined with red; Prince Albert Kerr, shaded crimson; Lady M. Marshall, fine yellow; and Our Leader, a semi-double crimson.

Mr. Charles Turner, Royal Nursery, Slough, sent a fine fancy Dahlia, named Mrs. Foster, in the way of

Queen of Italy, but of better form, and edged with magenta and buff—a very pleasing and promising flower; and the same award was made for the following new pompon Dahlias:—Don Juan, shining maroon, small, perfect model in shape; Gazelle, pale yellow, tipped with bright purple; and Isolante, white and violet with dark orange reverses—very pretty and distinct. He also had Lothair, Eccentric, Lady Jane, bright red; Dandy, Morgan, and Hector.

Mr. R. H. Munday, Church Street, Basingstoke, was awarded a First-class Certificate of Merit for Cactus Dahlia Empress of India, crimson, striped with maroon fine and distinct.

—Mr. G. Harris, Orpington, Kent, had the following new show Dahlias:—Freedom, a pale yellow self; Baroness, deep yellow self; and Terra Cotta, a mixture of pale red and brown.

Mr. G. Humphries, Chippenham, was awarded a First-class Certificate for fancy Dahlia Valentine Humphries, yellow ground, striped with crimson and edged with delicate pink. He also had John Coope, a fancy, bluish ground, flaked and spotted with maroon.

Mr. T. S. Ware, Hale Farm Nurseries, again had one of those unique collections for which he is so famous, the main feature being Dahlias, the Cactus varieties being prominent, and the blooms of these were set up in bold curves and segments, making a very imposing display.

A first-class certificate was awarded to Cochinel, one of the new type of pompon, striped with maroon, well formed and very showy; Constance, Mrs. Hawkins, Juarez, Picta formosissima, William Peace, Mrs. A. W. Tait, white; Lady E. Dyke, Fascination, delicate ground, edged with pale purple; Prince Alexander, yellow, pale red, striped with crimson; King of Cactus, &c. Of pompon varieties the following were fine bunches:—Rosetta, Isabel, Darkness, Golden Gem, White Button, Little Arthur, Prince of Lilliputians, E. T. Jungker, Titiana, Brunette, Gem, Minnie, Favourite, White Aster, Rosetta, and King of Kings. Single varieties were represented by striking bunches of Mauve Queen Improved, John Downie, rich crimson; Mrs. Coninck, delicate purple on a white ground; Albert Victor, Mrs. Charles Daniels, white, bordered with scarlet, very pretty and distinct; Pantaloon Improved, Cuckoo, White Queen, and White Beauty, Miss Linaker, Miss Bowan, and Mrs. Cullingford.

Messrs. William Paul & Son, Waltham Cross, had eight boxes of Roses that were charmingly fresh for the season of the year, the leading varieties were *Niphetos*, *Martin de Heute*, *William Allen Richardson*, *Perle des Jardins*, *Catherine Mermet*, *Sultan of Zanzibar*, *Grand Mogul*, and *Baroness Rothschild*.

FIRST-CLASS CERTIFICATES.

Cespedisia discolor (W. Bull).
Cragia Lalanda (J. Veitch & Sons).
Crimum Powellii (Sir T. Lawrence).
Cyrtopodium Sanderianum (J. Veitch & Sons).
Cyrtanthus hybrida rosea (Sir T. Lawrence).
Dahlias: Lady M. Marshall and Charming Bride (Cochinel & Sons); Gazon, Don Juan, and Mrs. Foster (Chas. Turner); The Quair (Paul & Son); Cochinel (T. S. Ware); Queen of the Belgians (Rawlings Bros.); Empress of India (R. H. Munday); Valentine Humphries (G. Humphries).
Davallia solida major (W. Bull).
Dianthus *var.* *Andros* *Queen of the Yellow* (J. Veitch & Sons).
Selaginella gracilis (J. Veitch & Sons); *S. tessellata* (W. Bull).
Ulmus Pittersii pendula (Paul & Son).

NOTES OF THANKS were awarded for

Adiantum cuneatum elegans (C. Kershaw).
Aquilegia Rauwolfi var. aurea (Paul & Son).
Callitella Gaskelliana Sunray (Dr. Duke).
Curcuma sumatrana (J. Veitch & Sons).
Dianthus Heddewigii, brilliant (R. Dean).
Hydrangea, blue by cultivation (S. Ford).

Fruit Committee.

Present:—T. Francis Rivers, Esq., in the chair; and Messrs. W. Paul, W. Warren, G. Norman, J. Ellam, J. Smith, J. Burnett, George Bunyard, P. Crowley, S. Ford, R. D. Blackmore, C. Silverlock, Harrison Weir, and T. B. Hayward.

A large collection of over 100 dishes of Apples was exhibited by Messrs. W. Paul & Sons, Waltham Cross, Herts. All were very good samples, and especially so were Alliston, Worcester Pearmain, Lord Suffolk, Shilling Castle, Gellin Bippin, Warner's King, Tower of Jewry, Eckinville Seedling, Wellington, Secklet Admirable, Cox's Orange, Small's Admirable, and Blenheim Orange.

Messrs. Paul & Son, of Cheshunt, also contributed a fine lot of Apples, the number of dishes shown not being quite a hundred. The fruits were fine and very clean samples, and some of them had the appearance of being grown under glass. The most noteworthy included:—Warner's King, Fearn's Pippin, King of the Pippins, Lord Suffolk, Cox's Pomona, Grenadier, Lane's Prince Albert, Sumner Strawberry, Eckinville Seedling, Duchess of Oldenburg, Winter Haulhornden, and Pease-god's Nonsuch.

Messrs. H. Lane & Son, Berkhampstead, exhibited five of their well-known pot Vines, which was good as usual. The sorts were Albatross, a good one; and two sorts of Foster's Seedling, Black Hamburgh—this was rather deficient in colour; and Gros Colton.

Mr. Thos. Laxton, Bedford, exhibited Laxton's Sandy Prize Onion, greatly resembling the white

Spanish; it is of a convenient size, and pretty in appearance; Laxton's new white Runner Bean, The Czar, which was about 12 inches in length; Laxton's Open-air Tomato, of which both fruit and a plant bearing fruit were shown. Both had been taken from between rows of Peas in the open air. The plant had a great quantity of fruit on it, and was very healthy. The latter was referred to Chiswick for trial. The Dartmouth Crab, a highly decorative variety, was also shown by this exhibitor. The fruit at first sight resembles in shape, size, and colour a Victoria Plum, and is covered with a thick bloom. The tree, shown in a pot, was a mass of fruit. A vote of thanks was awarded to this.

Mr. W. Roupell, Roupell Park, S.W., showed Fern Fertility in a pot. It appears to be very appropriately named. Grape Madresfield Court Muscat, the berries of which were of large size and the bunches well finished, was also shown by Mr. Roupell, and received a Cultural Commendation.

Melon Her Ladyship's Favourite was sent by Mr. G. Gilbert, Burleigh Gardens, Stamford.

Mr. J. James, Cowley Road, Uxbridge, exhibited a seedling Tomato extremely fine in appearance—full, plump, and of a rich and deep tone; the flavour was not, however, all that could be desired.

Mr. R. Smith, Yalding, Maidstone, contributed Peach Prince of Wales, which had been grown in the open air. The fruit was very fine, and of a good flavour.

The New South Wales Commission sent a basket of Oranges, under the name of Marvel, which had been grown by Mr. Thos. Hungerford, on Boerami Station, Mulsebrook, N.S.W. The fruits shown were from eight-year old trees by ordinary cultivation, and had not had any irrigation. Fine large fruits were these, and had a good flavour, and the committee Highly Commended the exhibit. This is another colonial product which is likely to be introduced into our markets, if only it will pay. That is the point!

From Mr. Burnett, The Deepdene Gardens, Dorking, came the "Tyson" Pear, and a nice flavoured large-sized Raspberry.

Rubus laevis in fruit was shown by Mr. Baines. Messrs. Paul & Son, Old Nurseries, Cheshunt, exhibited several plants of a new perpetual Strawberry, "The Heart." The plants were very good, and in the open, without forcing, and had a fine ripe fruit on them and a lot of fruit still green. The second crop is mostly borne on the ends of the runners.

A Pumpkin was shown by Mr. Harrison, gr. to W. Reade, Esq., of Little Hall, Kent. It was about a foot in diameter, but no data was given. We have seen larger specimens.

Several other small exhibits were before the committee, but they do not call for any particular mention.

HERBACEOUS PLANTS.

It is to be hoped the day is not far distant when herbaceous plants as a class will resume their wonted position in the decoration of the outdoor garden. When the bedding-out craze was introduced it was an ill-starred day for them, and ultimately brought many a rich and well-ordered collection to grief. It is not desirable, however, to monopolise every available bit of ground for the cultivation of herbaceous plants, and probably the day is gone, never to return, when we shall be reduced to dependence upon them alone for the decoration of the garden and a supply of cut flowers. On the other hand, they ought to be reinstated in most of their former places from which they were ousted, together with trees, shrubs, and fruit-bushes, to make room for the monomania which was then raging. Although it is unquestionable that hundreds of plants became lost to the country through that cause alone, fortunately there remained a few princes amongst herbaceous plant growers, from whose well-stocked gardens the country is gradually being replenished. Old-fashioned things are emerging from cottage gardens in whose peaceful arbours they had taken shelter, and weathered the storm.

They are everybody's flowers, from the poorest to the richest of the Queen's subjects, and here hinges the whole secret of their value and utility. Given a few square feet of soil, with sufficient exposure to light, and the meanest may attempt their cultivation with reasonable hope of success. On a more extensive scale a judicious and well-ordered selection may be made to yield a supply of flowers all the year round, and this without the aid of artificial heat. A neat, airy, and well-lighted greenhouse, even if unheated, would be a most valuable adjunct to a garden with an extensive collection of hardy plants. This, if made the recipient during winter and spring of plants that flower naturally at that season, would afford them the necessary protection from wind and rain, in order to develop in perfection flowers that belong to a more sunny clime.

This would imply a collection in pots, of which the most valuable only of the plants need be permanent, while the others might be annuals, or lifted from the open ground at a convenient season. Besides permitting a close and easy inspection, such a

house and its contents would afford pleasure and satisfaction to its owner, and might be utilised profitably for some other purpose in summer. Saxifraga ligulata, which flowers naturally in the end of February or in March, according to the weather, is very amenable to pot cultivation, and indoors may be induced to flower by Christmas or immediately after. Endless variety can be secured by growing such as Iberis saxatilis, I. gibraltarica, Saxifraga Burseiana, S. oppositifolia, Chionodoxa Lucilife, various species of Crocus and other early flowering plants that will repay the little extra trouble incurred in growing under glass. The cooler that Chionodoxa can be kept the better it will look, and it suffers being frozen with impunity. These are but a few of the hundreds of plants that might be utilised for such a purpose.

The most economical, serviceable, and all-round convenient method, perhaps, of arranging a collection of herbaceous plants for general effect and variety of display is the old-fashioned one of cultivating them in borders. For convenience of inspection these ought not to be more than 12 to 15 feet wide, although wider ones are sometimes recommended, and narrower ones will suffice. A systematic arrangement of the plants in lines will not destroy their effectiveness, for the different heights, hues and tints of both foliage and flowers, and their general contour, will prevent any undue appearance of formality that might arise were they planted for purely botanical purposes.

Furthermore, herbaceous plants need not be absolutely confined to borders, for what can have a more telling effect in autumn than a bed of Kniphofias at the end of a long walk or vista? Many other bold or stately subjects might be singled out in like manner, such as Funkias, Liliums, Delphiniums, Paeonies, Anemone japonica, with its varieties alba and hybrida rosea. I shall not soon forget the stately and sentinal-like appearance of a row of our native Lythrum Salicaria in an old-fashioned garden planted as a background to some summer flower-bedding arranged on gravel. The effect was rendered even more striking if a few of the stems were blown on one side, as if in the attitude of defence. Nothing in the hardy plant way can be more suggestive of a tropical vegetation than well-grown specimens of Gunnera chilensis or G. manicata planted near water, where their roots may dip down and obtain an unstinted supply. For drier places, or the shrubbery, Heraclium villosum has few equals for a princely and commanding appearance.

Not these isolated subjects alone, but herbaceous plants in general, well repay liberal treatment both in a healthier and more robust growth, together with a greater produce of flowers. I cannot sympathise with those who starve their plants rather than dig their borders for fear of hurting the roots; for, except in the case of tuberous-rooted subjects, such as Alstroemerias or Liliums in full growth, no harm will result if the border between the lines of plants be rather roughly dug up after being heavily top-dressed with some well-rotted manure.

In a thoroughly representative collection there is a maximum return for a minimum outlay; for when once a collection has been got together, an annual top-dressing, forking over, timely staking, and hoeing or weeding, together with a little attention to the propagation of rare or tender subjects, complete the routine of the more important operations in connection with this class of plants.

To the ardent cultivator, however, it will soon become apparent that a rockery is desirable, or even indispensable, where alpinas are grown to any appreciable extent, in order to secure the variety of soil, shade, moisture, or exposure necessary for subjects of as many different habits. Above all, whether grown in beds, borders, or on rockwork, the interest or value attached to a collection will be much enhanced if the subjects so grown are correctly and legibly labelled; for not only will the owner derive pleasure and satisfaction therefrom, but the rising generation, whether professional or amateur, have an opportunity, not only of learning their habits and requirements, but also their names—a key to their whole history. J. F.

BOTANIC GARDEN, SINGAPORE.—Mr. Cantley's report for the year 1885 is chiefly of interest to us at home for the list of cultivated vegetables used in the colony, with the native names applied to them. Amongst other things, the Malays eat the young shoots of various *Ferros*, such as *Ceratopteris thalictroides*, *Anisogonium esculentum*, *Stenochloa palustris*, *Blechnum orientale*, and *Thamnopteris sidis*. Attention is called to the necessity for the careful conservation of the gutta-percha forests.

Variorum.

CULTIVATING THE MAMMOTH SEQUOIA OF CALIFORNIA.—To the editor of this magazine one of the most interesting lessons learned in California was one which only one experienced in the culture of trees could learn; namely, that the Sequoia gigantea is by nature a swamp tree. The places where they grow now are comparatively dry; but two or three thousand years ago they followed the track of descending glaciers, and they received the melting snows from the tops of mountains that have no summer snows now. The ground on which these mammoth trees stand, once very wet, or even swampy, has become drier through the long ages. Horticulturists know that swamp trees generally grow very well in ground that is comparatively dry, but seeds of such trees will not sprout in anything but the moist oozy moss on the top of a swamp or damp ground. Hence the only young trees we find in the mammoth tree locations are where a chance seed happens to fall on a moist rock, or other damp situation. Young trees are common only in one location, where clouds condense against a mountain-side, and the whole situation abounds with springs and oozy spots. Here in the east hundreds of trees have been planted during the past quarter of a century, but rarely has one lived more than a few years. They do not mind the winters. We have known them stand 20° below zero uninjured, but some fungus, favoured by a dry atmosphere, carries them off gradually during the summer season. Profiting by these facts, the writer brought three strong plants from California and set them in a swamp. Usually when we set swamp trees in a swamp they will not grow unless they are suffered to grow into the swamp themselves. We make a mound and plant them in the mound, from whence they root down as suits themselves. These three plants have had two winters and one summer, the past winter being a terribly severe one. To-day they look perfectly sound and flourishing, and the editor believes that he has at last discovered how to make the great tree of California thrive in eastern gardens. *Gardeners' Monthly*.

JAPAN CLOVER (LESPEDEZA STRIATA, H. A.).—My attention, says Dr. Schomburgk, was directed to this valuable fodder plant by Mr. T. E. Schlegel, of Beachport, by his sending me a cutting from a Californian paper (the *Rural Californian*), which gives a glowing account of this remarkable plant. The extract runs as follows:—The perennial Clover, *Lespedeza striata*, is now covering thousands of acres where in 1866 it only covered 100 feet square. It grows in the plains, and at an altitude of 4000 feet, and stands well through the midsummer droughts, flowering and blooming until the frost comes, and even living after most herbage is dead. It grows on every kind of soil—rich or poor, clay or sandy, dry or wet—and is deep-rooted and improving the soil. It never runs out, and can be fed off without injury. It is wonderfully fattening, and contains—

Nitrogen matter	.. 16.60	Potash 0.83
Fat 1.10	Soda 0.51
Ash 5.02	Phosphoric acid	.. 0.30
Lime 0.93	Sulphuric acid	.. 0.29
Magnesia 0.56		

DEPENDENCE OF THE GROWTH OF WOOD UPON METEOROLOGICAL FACTORS.—A. Spamer communicates the following conclusions as to the dependence of the growth of wood upon meteorological factors:—
1. Temperature and precipitation are the meteorological phenomena that affect the process of the formation of wood. 2. Of these two variable quantities during the principal period of growth, the rainfall diminishes the formation of wood while the heat increases it. 3. The principal period of wood growth is from July to October, at least for the plants which are very sensitive to frost. 4. The rainfall seems to influence growth more than the temperature. [Excess of rain diminishes growth more than excess of temperature increases it.] 5. The growth of different plants is not affected in the same degree by the rain; some are attracted more by rain and others by the temperature. 6. In many periods only one of these factors appears to exert any influence, the other being inactive. 7. Possibly this anomaly may be explained by observations of the duration of insolation. 8. The increase of carbonaceous compounds goes parallel with the increase in the inorganic constituents of the wood. 9. The aqueous component of the wood diminishes when the carbonaceous increases. 10.

The so-called ripe wood (the heartwood) differs from that which is less ripe by a greater amount of ashes and carbon. *Smithsonian Institute Report*.

Obituary.

We have received intelligence of the death of Mrs. BLAIR. She was in her 94th year, and had been for twenty-one years a pensioner of the Gardeners' Royal Benevolent Institution.

The death, on the 10th inst., of the Rev. C. P. PEACH, at Appleton-le-Street, Malton, is announced. Mr. Peach was in his 58th year, and for some years past had been in ill health. Mr. Peach was an excellent cultivator, who knew how to mould and improve his practice by the teachings of science. He was a frequent contributor to the gardening journals, and occasionally to the *Gardeners' Chronicle*, his chief subjects of predilection being Roses, fruit trees, and herbaceous plants. As a friend he was genial and straightforward—a man who will be very greatly missed among his friends and neighbours.

The Weather.

- Sept. 16.—Fine day, generally dull, but bright at times.
- 17.—A fine and bright day throughout.
- 18.—Fine day throughout.
- 19.—A fine day throughout, cloudy at night.
- 20.—Dull in early morning, but fine and bright after wards.
- 21.—Frequently bright, but a dull afternoon.
- 22.—Fine and bright in morning, but dull and cloudy afterwards.

LONDON: Atmospheric Pressure.—During the week ending September 18, the reading of the barometer at the level of the sea increased from 30.01 inches at the beginning of the week, to 30.15 inches by the morning of the 13th, decreased to 30.05 inches by 5 P.M. on the same day, increased to 30.44 inches by 1 P.M. on the 16th, decreased to 30.19 inches by 5 P.M. on the 17th, and was 30.09 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.20 inches, being 0.22 inch higher than last week, and 0.15 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 75° on the 14th; the highest on the 16th was 60°.9. The mean of the seven high day temperatures was 67°.6.

The lowest temperature in the week was 40°.8 on the 17th; the lowest on the 13th was 60°. The mean of the seven low night temperatures was 48°.9.

The greatest range of temperature in one day was 25° on the 18th; the smallest was 14°.5 on the 13th. The mean of the seven daily ranges was 18°.7.

The mean daily temperatures were, 59°.5 on the 12th; 66°.3 on the 13th; 65°.1 on the 14th; 56°.4 on the 15th; 52°.9 on the 16th; 53°.1 on the 17th; and 53°.4 on the 18th. These were above their average till the 14th, by 1°.9, 8°.9, and 7°.9 respectively, and below their averages from the 15th, by 0°.7, 4°, 3°.5, and 3°, respectively.

SEEDS.

LONDON: Sept. 22.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., state that the seed market to-day exhibited no fresh feature. There are still some small orders dropping in for Trifolium. The supply of winter Tares on the spot is short; values are unaltered. Many of the samples of new white Mustard now offering are in poor condition. Rape seed fully maintains late rates. Less money is accepted for Hemp seed, the tendency of values continuing against holders. Canary seed sells on former terms. Blue Peas are cheaper. Some choice New Zealand Cockfoot is now obtainable on moderate terms. Feeding Linseed is steady.

CORN.

MARK LANE: Sept. 23.—Of good white English Wheat, offered at 34s., red at 32s., merely retail quantities were taken off. In foreign Wheat there was barely enough business to establish quotations, but the tendency was adverse. Part of the large arrivals is being sent to granary from lack of demand. Flour was difficult to sell at 6d. decline. Good Malting Barley is firm from scanty supply. Ordinary sorts met no demand. Grinding Barley is barely supported on the spot, and a rather lower price has been accepted for arrival. Round Malt is declined 3d. on the spot, and is also easier floating. Beans are firm. Peas have a downward tendency. With large receipts, Oats were 3d. lower on the week for common qualities.

Sept. 22.—Trade was inactive. With merely retail sales of Wheat and flour, prices were nominally unaltered from Monday last. Malting Barley of good quality met inquiry, but common grades remained dull. Grinding sorts were quiet. Beans and Peas were quiet at late rates. Oats met a slow sale without further change in value.

Average price of corn for the week ending September 18:—Wheat, 34s. 3d.; Barley, 28s. 1d.; Oats, 18s. For the corresponding period last year:—Wheat, 30s. 10d.; Barley, 31s. 1d.; Oats, 19s. 2d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Sept. 22.—Large consignments of all kinds of fruit and vegetables arrived, and were readily disposed of at moderate prices. Quotations:—Damsons, 2s. 6d. to 4s. 6d. per bushel; Plums (black), 2s. 6d. to 3s. do.; Pears, 2s. to 4s. 6d. do.; Apples, 2s. to 4s. 6d. do.; Scarlet Beans, 1s. to 2s. per sieve; Vegetable Marrows, 2s. 6d. to 3s. 6d. per tally; Cabbages, 2s. 6d. to 5s. do.; Green, 2s. to 3s. per dozen; Turnips, 2s. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. do.; Turnips, 1s. 6d. to 2s. do.; Parsley, 1s. to 1s. 6d. do.; Onions, 70s. to 80s. per ton; Carrots, 35s. to 40s. do.; Mangels, 17s. 6d. to 22s. do.

STRATFORD: Sept. 21.—The market has been well supplied during the past week, and a brisk trade was done at the undisturbed prices.—Cabbages, 3s. 6d. to 4s. 6d. per tally; Cauliflowers, 2s. to 3s. per dozen; Turnips, 2s. per dozen bunches; Mangels, 20s. to 22s. per ton; Onions, 2s. to 2s. 6d. per bushel; Apples, 2s. to 2s. 6d. do.; Watercress, 6d. per dozen; Tomatoes, 1s. 6d. per dozen lb.; Plums, 1s. to 1s. 3d. per half-bushel; Pears, 1s. to 2s. per bushel; Damsons, 1s. 6d. per half-sieve; Orlean Plums, 1s. 6d. to 1s. 9d. do.; Celery, 10d. to 1s. 3d. per bundle.

POTATOS.

BOROUGH AND SPITALFIELDS: Sept. 21.—The bulk of the supply consisted of second and inferior qualities, which were very dull of sale. Best samples met a fair demand. Quotations:—Kent Regents, 70s. to 60s.; Essex, 45s. to 70s.; Hebrons, 70s. to 60s.; Early Rose, 50s. to 70s.; and Magnum Bonum, 50s. to 80s. per ton.

COLUMBIA (East London): Sept. 22.—Magnums, 40s. to 70s.; Regents, 60s. to 65s.; and Victorians, 50s. to 55s. per ton.

STRATFORD: Sept. 21.—Magnums, 45s. to 65s.; and Regents, 55s. to 65s. per ton.

Government Stock.—Consols closed on Monday and Tuesday at 100½ for delivery, and 100½ for to the account. The final quotations on Wednesday were 100½ for delivery, and 101 to 101½ for the account. Thursday's final record was 100½ to 101 for delivery, and 101 to 101½ for the account.

GREENHOUSES, VINERIES, RANGES, CONSERVATORIES, FORCING HOUSES, &c.

Constructed with the latest horticultural improvements to the most artistic designs, of the best materials, at the lowest prices. THE EFFICIENCY OF ALL WORK, INCLUDING BOILERS AND HEATING APPARATUS, GUARANTEED. Illustrated Catalogues, Designs, Plans and Estimates free of charge.

Crompton & Fawkes

Horticultural Builders
Chelmsford.

THE NEW PATENT TUBULAR
COMBINATION STAKE
AND CLIP,
For Trees, Roses, Dahlias, &c.

(CARTWRIGHT'S PATENT)

THIS PATENT STAKE AND CLIP is at once simple, effective, durable, economical, and safe. It does away with the necessity of tying with string or grass; and when once the tree is fixed in position it is utterly impossible for it to get loose again by the action of the wind or weather; in fact, it must remain fixed in position until the gardener himself loosens it. Does not harbour insects and their eggs as do string and cloth.

The Stake itself is a wrought-iron tube, and is made in various lengths, from 3 feet up to 7 feet 6 inches.

The Spring Clips are supplied in various sizes, of 1, 1½, and 2 inches across the ring when shut, and are coated with soft indiarubber.

Light Brass Caps are also supplied when required. These Caps are fixed on the top of the tube to keep the rain and car-wigs, &c., from getting to it.

We can also supply these

STAKES ADAPTED FOR RASPBERRY CANES
WHEN GROWN IN CLUMPS.

These Stakes are supplied with two large Wire Clips, one on each side of the Stake, as shown in sketch.

MAY BE OBTAINED FROM ALL SEEDSMEN, &c.

Wholesale from CORY, SOPER, FOWLER & CO. (Limited), London; OSMAN & CO., London; BENJAMIN FIELD, Swan Place, Old Kent Road, London, S.E.; or, from the Manufacturers THE PLASKYNASTON TUBE COMPANY (Limited), Ruabon.

Five 1st Prize Medals recently awarded in open competition.

Five 1st Prize Medals recently awarded in open competition.

THE DARLINGTON

GOLD MEDAL ALL-WOOL DRESS FABRICS

(AS WORN BY H.R.H. THE PRINCESS OF WALES)

Are now Supplied Direct from the Manufactory, at Wholesale Price, there being no Intermediate Profits whatever.

PLEASE NOTE THAT ANY ARTICLE CAN BE CHANGED WITHIN SEVEN DAYS.

Ladies in any part of the World are invited to Send FOR PATTERNS, Post-free, of the new makes for the Autumn and Winter Seasons, which embrace every variety of material desired, and of which the *Daily News* says:—

"The union of warmth to lightness, so necessary to health, is, in these materials, brought to perfection. . . . The fineness of the wool of which they are composed—English wool, be it understood—imparts the admirable quality of draping in those soft folds now so essential from the point of view of fashion."

SPECIAL ATTENTION is directed to our celebrated CROSS-WARP SERGES, which, alike, resist the effects of weather and sea, 10*d.* to 3*s.* per yard. Our GOLD MEDAL CASHMERE, in all the New Colourings, from 1*s.* 6*d.* to 4*s.* 6*d.* per yard. Oil Paint no Longer Necessary.
HILL AND SMITH'S BLACK VARNISH,
for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)
THIS VARNISH is an excellent substitute for oil paint or any outdoor work, and is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cool. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 12 6d. per gallon, at the Manufactory, or 12 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq., *The Rydes, Alderley Lodge.*
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.
Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.
Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

ROBERT WARNER, F.L.S., F.R.H.S.,
Author of "Select Orchidaceous Plants,"
AND
BENJAMIN SAMUEL WILLIAMS, F.L.S., F.R.H.S.,
Author of "The Orchid Growers' Manual," &c.
THE BOTANICAL DESCRIPTIONS BY
THOMAS MOORE, F.L.S., F.R.H.S.,
Curator of the Chelsea Botanic Gardens.
The Coloured Figures by JOHN NUGENT FITCH, F.L.S.
Dedicated by special permission to Her Royal Highness the Princess of Wales.

Five Volumes, containing 500 Hand-coloured Plates, now ready. Price £45, unbound, or bound in strong hand some covers with gilt edges, Price £48 10s.
This Album is issued in Royal Quarto, which enables the Artist to produce ample and intelligible portraits of the plants, which are drawn and colored by hand in the best style.
The text contains English botanical descriptions of the plants figured, notes on their cultivation, and such general observations concerning them as may be likely to prove of interest or utility to Orchid-growers.
The Work is issued regularly in Monthly Parts. Each Part contains four handsomely hand-colored Plates, with descriptive Letterpress, and a Volume, consisting of Twelve Parts, is completed annually.
Prices, per Part, or for per annum (Twelve Parts), Post free.
Vols. I., II., III., IV., and V. can be supplied, bound complete, with gilt edges, price £45 for each.

JUST PUBLISHED,

TESTIMONIAL.

MESSRS. THOS. GREEN & SON, LTD., NORTH ST., LEEDS.

Re HEATING APPARATUS.

GENTLEMEN, — I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them faced. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

Borough Engineer's Office, Municipal Buildings, Leeds,
January 9, 1886.

RHODODENDRONS and AZALEAS.

ISAAC DAVIES & SON
 Have pleasure in calling attention to their extensive stock of Rhododendrons and Azaleas of all descriptions, for Planting or Forcing, which are this year healthy, bushy and well budded. The *Azalea mollis* are remarkably fine and well budded, and they offer good bushy Plants, full of buds, at 8s. to 9s. per dozen; 5s. to 6s. per 100. They have also to offer, in quantity, Hollies, Aucubas, Laurels, Retinosporas, flowering and Ornamental Trees and Shrubs, *Lilium auratum*, &c. Their stocks of these are unusually fine, and the prices are very moderate. Catalogues post-free on application.
Brook Lane Nursery, ORMSKIRK, LANCASHIRE.

NEW DESERT APPLE, "Beauty of Bath."

GEO. COOLING & SONS

Have pleasure in offering a small Stock of this fine early Desert Apple.

It ripens in July and early part of August, is quite distinct, of medium size, exceedingly handsome in appearance, being beautifully striped with red towards the sun, has a brisk, sweet flavor, and is in every respect far superior to Junetung of Irish Peach: it is a large and certain cropper, and on that account will be most valuable at a market variety. It has been the prize of the post two seasons it has been awarded First Prizes in the Dessert Classes at Taunton, Torwbridge, Weston-super-Mare, Keevil, and other West of England Shows, where Apples are always well exhibited.

Strong Maiden Trees, 3s. 6d. each ; Pyramids, 5s.

Usual Discount to the Trade.
 As our Stock is very Limited, we respectfully solicit early Orders.

THE NURSERIES, BATH.

DUTCH BULBS, DIRECT FROM THE GROWERS.

ANT, ROOZEN & SON'S CHOICE FLOWER ROOTS.

THE Gardeners' Chronicle.

SATURDAY, OCTOBER 2, 1886.

THE WEALD.

(The Weald as it was and as it is—Messrs. Cheal's nursery at Crawley—its principal features, Parade Bees—Rockwax—Dahlia, single and double, Cactus, and pompon—Reprehensible conduct of the bees; out of evil cometh good—*Clavus a son goni!*—The reason why—Principles of variation—Unsavouring the pedigree—Alleged constancy of some characters, variation of others, selection and no selection—Philosophy in the study and in the garden—Fruit trees, cordons. The most of the best from the least—More philosophy—The results of sharp practice, a full fruit-rom—Progress, its promotion and hindrance.)

THE casual traveller traversing the Weald of Sussex by means of the Brighton line of railway at the rate of fifty miles an hour, or the same individual overlooking the district either southward from Red Hill or northward from the Brighton Downs, would, in all probability, arrive at very erroneous conclusions as to the true nature of the country. Probably he would look on it as, on the whole, flat. A clay soil, with frequent swamps and abundance of timber, principally Oak, would strike him as the predominating characteristics of the district. If he passed through a tunnel, in all probability he would, without paying special attention to the matter, and remembering the proximity of the South Downs, say off-hand that it was a chalk tunnel. Like most general conclusions arrived at from partial and incomplete observation, these would be tinged with a strong infusion of error. Clay there is, swamps there are, Oaks abound, the Brighton coach road is for miles almost as flat as a billiard-table, though now more frequented by bicycles than by coaches. But until the traveller makes use of his own natural method of locomotion, or avails himself of that furnished by a horse, he will have little idea of the many ups and downs, the steep ascents and sharp descents of this old forest country of Anderida. Still less opportunity will he have of familiarising himself with those warm, dry, and yet moisture-absorbing sandstone rocks, which he may have associated with Tunbridge Wells, but which he had not connected in his own mind with the Wealds either of Kent or Sussex. In truth the Weald, the broad tract between the North Downs and the South, which seems so uniform in its character when looked at from a distance, consists of two very distinct portions, each marked by its own special characteristics. There is the Weald clay, heavy, cold, stubborn, waterlogged, flat, and low-lying. Sometimes it is more or less mixed with sand, and then forms a fertile Rose-growing, Wheat-producing soil. There are, again, the Hastings Sands, beds divided into numerous subdivisions, high-lying, sandy as the name implies, rocky and pictorial; woods and undergrowth abound; large parks are numerous, villages are small, towns, except along the line of rail, do not exist; cottages are few and far between. The villages are often on the top of the hills, as if originally to secure immunity from the ill-drained swamps below,

or to insure protection against forest marauders of all kinds. A wolf or a wild boar would not be such a very extraordinary apparition in this locality. There must have been plenty of them once in the "wald," "weald," or forest. An iron furnace in full blast would seem out of place now-a-days in this situation, and yet it is not so very long ago that ironworks were in full operation in this now quiet, sylvan, and thinly-peopled district. Who can tell whether by some strange revolution all this may not one day again be changed, and iron smelting again form a staple industry of Sussex? There is the wood and there is the iron, and stranger things than this have happened. But it is no part of our business to speculate on what may be, though the temptation to say something of what has been becomes almost irresistible when passing through such scenery.

Let us wander too far, however, it is as well to say that our object in penning this article is to say something about a branch of industry comparatively recently established in this district, but to such good purpose that its promoters have achieved a well-earned reputation; and, judging from appearances, there is every chance of its increasing as time goes on. Messrs. Cheal's nursery at Crawley is on the low-lying part of the district. Part of the site once formed part of a common. Common land and poor soil often go together, but it is not quite so in this instance; the lamy soil here seems to suit fruit trees and Roses to perfection. Many Conifers do well; Rhododendrons thrive; deciduous shrubs seem quite at home. A long border faces the high road, where trees and shrubs, graceful Pampas-grass, fiery Tritomas, bright Phloxes, and glowing Fire King Dahlias, are arranged on parade to attract and, it may be, to tempt the passer-by. Branching off at right angles is a long green way, turfed in the centre and bordered on either side by a selection of choice shrubs, deciduous and evergreen, intermixed with gay flowering plants,—also a parade ground. This method of arranging plants is the one most commonly adopted in nurseries, and experience proves, what common observation suggests, that it is the simplest and readiest way of bringing under the notice of the visitor the distinctions and comparative merits of particular plants. Messrs. Cheal, however, do not rely exclusively on this mixed border system. Groups arranged for effect are as likely to attract the visitor, and are more useful to the intending planter than the more formal linear disposition.

A rockwork lately established by Messrs. Cheal affords in its way an illustration of the grouping system. It is at present on a small scale, and has not been long established, but enough may be seen to show how attractive and beautiful a feature it will become. The design is simply a low undulating bank with a small piece of water at the base, and overlooked by a steeper bank on the opposite side which projects like a promontory, and is capped by a rustic summer-house. The conception presents no very original feature, but, as carried out by Messrs. Cheal, it adds an element of much beauty to their establishment, and at the time of our visit it was radiant with bloom, and impressed us with the care that had been exercised in the selection of the plants, due attention having been paid to balance, proportion, and contrast in point of form and size—matters in which the amateur, if unguided by the practical experience of others, is very apt to go astray.

Messrs. Cheal are largely engaged in landscape gardening works and in planting operations. Their nursery accordingly is largely occupied with the usual furnishing stuff in every variety of ornamental and useful trees and shrubs, and it was a pleasure to see symptoms of a revival of taste for the better class of flowering shrubs and ornamental trees which have been too much neglected of late years. The increasing demand for forest trees, as well as for those of a more strictly ornamental character necessitates more space, and so we find Messrs. Cheal, like other successful nurserymen, covering acre after acre with new plantations, and turning the steam cultivator to account, thereby securing an advantage over trenching in efficiency, rapidity, and economy. Without occupying space with details that may be seen in any nursery, more or less, we may more advantageously allude to some of Messrs. Cheal's specialties, and in particular to the Dahlias and fruit trees.

SINGLE DAHLIAS.

Although, just previous to our visit, there had been a touch of frost which had somewhat injured some of the flowers, it was not sufficient to interfere with the general effect. The single Dahlias in particular were very varied and very beautiful. Seen from a little distance they resembled a mosaic of brilliant, harmonious or contrasted colours. Moreover, there was an appearance of selectness and refinement about them, contrasting rather forcibly with the ungainly form of the "lumpy, inelegant" ones in other quarters of the ground, and an appearance which reflects credit on Messrs. Cheal's taste in selection. Bees tumble about in a state of hopeless intoxication over these flowers, and so effect numerous crosses. Out of evil comes good! If the bees did not indulge their natural appetite to such excess, we should probably not have so many beautiful Dahlias; but this is a matter of ethics that we do not feel called on to deal with, which is the more fortunate, seeing our inability to do so. At any rate, whether by accident (so called) or by design, Messrs. Cheal raise numerous seedlings which are here tried. A large proportion are found wanting, and are rejected accordingly. A glance over the reserved collection of named and unnamed varieties suffices to show that the qualities Messrs. Cheal aim at, consciously or unconsciously, are profusion of flowers, evenness of form, purity and brilliancy of colour, combined with medium size. Some flowers are flat, others slightly recurved, the best with broad petals and with a luminosity of colour unsurpassed unless it be by the Forget-me-Nots and Gentians of the Alps. But the raiser has to consult various tastes. There are some who admire the form of double Dahlias, there are some—and we are told these are principally ladies—who prefer muddy tints to the rich purity of colour which delights others. This we suspect is a relic of that aestheticism (so called) which we should qualify by the affix nonsensical, but that it is a caprice that is rapidly dying out.

Among the finest varieties, new and old, at the end of September we may mention the following, classifying them according to colour. By large we here mean a flower 3 inches across and upwards; by medium, one of 2–3 inches; by small, one less than 2 inches; but the size, of course, varies according to season and other considerations—we merely speak of things as we find them.

WHITE.

Alba perfecta.—Remarkably distinct in foliage, the segments, or some of them, are unusually tapering at the base. Flowers large; rays spreading oblong-ovate; good form.

Mr. Tail.—Medium-size; white, with fringed petals.

YELLOW.

Primrose.—Stem hairy. Leaves coarsely toothed. Bracts very long. Flowers large; rays oblong, somewhat pointed, clear yellow.

Alfonso.—Stem slender, purple, glabrous. Leaves coarsely toothed. Flowers large; rays flat, broadly obovate, fine canary-yellow of

Mrs. Hawkins—yellow shaded with pink.

ORANGE-RED.

Sunset.—Stems slender, purple, glabrous. Flowers medium; rays yellow deepening into orange-red.

Helen.—Stems purple. Flowers large; rays reflexed, rounded, luminous yellow shading off into pinkish-brown or red.

Beauty of Upland.—Leaf-segments ovate-lanceolate, coarsely toothed. Flowers large; rays flat or reflexed, orange-red with a spot of yellow at the tip.

Picta formosissima.—Orange, with marginal stripes of a deeper colour.

Edith.—Stem slender, glabrous. Leaves coarsely toothed. Flowers large; rays flat, oblong-obovate, spreading, orange shaded with crimson; disc small in proportion to the rays.

Mr. Kennett.—Stem glabrous, stout. Leaf segments ovate-lanceolate. Flowers large, of good form; rays flat, reflexed at the ends, yellow, variously striped and marbled with orange and red stripes.

Formosa.—Leaf segments very pointed. Flower medium, of good shape; rays reflexed, rich velvety brown-red.

Benjamin Backhouse.—Stem hairy, purple. Leaf segments acuminate. Flowers medium to large, of good shape; rays flat or cupped, dark.

Enchantment.—Stem purple. Leaf-segments broad, acuminate. Flowers medium, of good form; rays shining red, yellow at the base.

DEEP RED.

Acquisition.—Leaf-segments coarsely toothed. Flower medium to large, finely shaped; rays reflexed, rich deep velvety-red.

Citizay.—Leaves very coarsely toothed. Flowers medium, of good form; rays rounded, reflexed, rich velvety brown-red.

Negress.—Leaf-segments narrow. Flowers medium to large; rays deep velvety brown-red.

Negro.—Very dark purplish-brown, similar to Negress, but better in form.

LILAC TO MAROON.

Lady of the Lake.—Leaf-segments acuminate. Flowers large, bracts very long; rays oblong-ovate, white at the base, lilac at the top.

Miss Linaker.—Stem purple, slender; leaf broadly ovate acute entire (!). Flowers large; rays spreading, oblong, deep lilac, yellow at the base.

Mrs. Cotton.—Stem slender, leaf-segments very pointed. Flowers medium; rays rounded, pale lilac, margins white.

Union Jack.—A federal union this, in which each unit does as it sees best to himself, but at the same time is inseparably linked to its fellows. This is a sort of Harlequin or Proteus flower, which would lead a strict florist to say "shocking," but which is not only pretty, but interesting. The plant has a glabrous purple stem, with ovate entire leaf-segments. The flowers are of medium size, and seem to produce every variety of colour, from white through various shades of lilac, magenta, maroon, reddish-brown, purple, and that very deep purple-brown which passes for black. These colours are distributed very differently in different flowers, but it is interesting to note that where there is a difference it is always the central part of the rays, which is lightest in colour, the darkest portions being at the margins. We have a theory to account for this, but it involves too many technical considerations for us to inflict upon the reader in detail, besides it is a mere speculation; suffice it to say, the ray consists of three petals in combination, the one in the middle in such cases is apt to be restricted in its growth and development by the outsiders which have more room in which to develop.

Maggie is like Union Jack, but has more lilac in the flowers.

Paragon is one of the purple-stemmed varieties; its beautiful flowers are too well known to need description.

Amos Perry also has the stem of a purple colour, with very long-pointed leaves, and very long bracts. The flower is large, of a rich maroon colour; the rays rounded and overlapping.

We might enumerate many more, but we must hold our hand, and content ourselves with saying that the tubers are started under glass in 5-inch pots, and planted out at the end of May, when fear of frost ceases to trouble. A rich soil is not desirable, as the tendency to grow too rampantly would thereby be too much encouraged.

SHOW AND FANCY DAHLIAS.

In these, in spite of the unsightliness of their form, the range and purity of colour are as remarkable as in the case of the singles. The flowers had suffered more from the frost than the single ones, but were still very showy. Gaiety, a pink-tipped form, measured no less than 6 inches across; Mrs. Gladstone, a pale rosy-lilac with a flush of primrose, pale in the centre, is exquisite in colour; Prince of Denmark, a very dark self, is of good form; the same may be said of Shirley Hibberd, but that variety is said to open its eye too soon, and to keep it in that condition too long. Our friend is a keen critic; was it some wag of a raiser who had his reasons for so naming this Dahlia? Mr. Harris is magnificent in this rich luminosity of colour. Then there are the show Dahlias, and the Cactus Dahlias, and the pompons, but we shall never have done, and our notes are getting mixed. Whether Fair Helen or Guiding Star be the best white for cutting, our notes do not quite enable us to decipher. Moral for the readers' benefit—Go and see for yourself, or, if that be not possible,

then—but this, though the next best thing to do, is a far inferior plan—send for a catalogue.

PRINCIPLES OF VARIATION.

Before we leave the Dahlias, it is allowable to allude to a matter of great interest to those who want to know the reason of things, and those that do not lose half the charm of a garden. This is the matter: Suppose we wished to ascertain the origin and parentage of the Dahlia—suppose, we say, for the fact that this particular matter is known does not affect the significance of our illustration. Our postulate, therefore, being granted, we should not look to the testimony of the flower in the first instance, because, what between the bees and the raisers, the variation is extreme, and the selectors have picked and chosen what suited them. But this picking and choosing has not, at least not to anything like the same extent, been practised in the case of the foliage. Here, then, is a point, say the philosophers, wherein the genealogist in working out a pedigree, and tracing back the ancestry, may more safely trust; let him in such case look to the leaves. Alas! for the theory, it may be all right—we believe the principle is right enough in the main—but it will not apply in the case of the Dahlia, wherein (harring colour) there is almost as much variation in the foliage which has not been specially selected as there is in the flowers which have been selected. From what has been said above there is, independently of height, which may have been influenced by selection, great variation in the colour and hairiness of the stem, the form of the leaf-segments, the size and shape of the deflexed bracts below the flower, and other matters which are indifferent to the cultivator, or which at least have not been expressly selected. A similar thing holds good in the case of the Potato. Few people of set purpose pay much attention to the haulm. It is the tuber which is the general object of their choice; but, while the tubers vary very much, the haulm and the foliage are very far from being exempt from variation. "This same philosophy is a good horse in the stable but an arrant jade on a journey," says Goldsmith. Inference—philosophers must not confine themselves to books and dried specimens, but as the great master, Darwin, did, seek knowledge from the flowers themselves in field or garden, or, as Sir Thomas Browne has it, suck divinity from the flowers of Nature.

FRUIT TREES.

This is another department to which Messrs. Cheal have paid special attention, and one as fruitful (no pun intended) in interesting speculation and profitable research as the Dahlias—only more so! Our impression received rather a shock at Crawley. We have read and had to write statements that Apples are "thin" this year. Perhaps so, but there are some exceptions, that is obvious. Here Colonel Vaughan, described as a good market Apple, which never fails to give a crop, is weighted down with an enormous crop, while Nanny, a Sussex Apple of medium size, pretty colour, and rich flavour, would certainly groan, if she could, under the weight of the crop. It is interesting to see how much a tree can bear, but the interest becomes almost painful to witness when one sees such a burden as this. These two trees were standards of considerable size, the boughs, however, being anything but standards just now.

CORDONS.

The cordons form, however, the chief feature in this nursery. How many there may be ready for emigration, how many in process of training the way they should go, we really cannot tell. How many budded on the Crab, how many on the Paradise, how many Pears on the free stock or on the Quince, how many Plums on the Plum stock or on the Myrobalan—the latter stated to be well-nigh blight-proof, how many Morellos, we fear to say. There are some figures in our note-book, jotted down as we walked along the quarters, but we fear to quote them lest we should be accused of exaggeration. Any way, this we may say, they are not only extremely numerous, but beautiful samples—clean, healthy, even, well grown, furnished to the bottom with fruit-spurs, and not a few, though mere infants, bowed down to the ground with the weight of produce. On a two-year-old cordon of Colonel Vaughan we counted two dozen Apples, and in some instances we saw fruits on yearling plants—some sorts more so than others, of course. It may be taken for granted that the sorts grown include the best of their kind, and Messrs.

Cheal and their fruit manager take special pains to be accurate in their nomenclature. The wonderful facility possessed by the managers of such establishments of recognising sorts from their wood and foliage alone is a faculty which makes botanists envious.

The best exhibition fruit, as a rule, is gathered from the cordons—a fact confirmed by the birds, which are particularly attentive to the cordons unless prevented by netting or other devices. The fruits are stored in a neat well-constructed fruit-room, to such purpose that, as late as June 15, no fewer than fifty-five varieties of late Apples were exhibited by Messrs. Cheal. In one quarter of their grounds Messrs. Cheal have arranged an experimental plot consisting of rows of stakes supporting horizontal wires at intervals, the width from row to row being just sufficient to allow any one without a dress-improver to pass. On these wires are trained Apples, Pears, Cherries, mostly as diagonal cordons. The object is to show how the maximum of produce can be obtained in the minimum of space. At the same time the space is so restricted that protection from frost by light netting thrown over the top is easily effected, while if growth be too rampant, this over-tendency to form wood can be restrained by root-pruning. But cordons are all over the place—against walls, covering boarded fences, bedecking archways, edging the quarters. Some of these cordons are budded, others grafted, the latter being preferred where a double cordon is wanted, for while the bud yields a single branch the first year, two are obtained from a graft. For forming diamond cordons this plant is obviously well suited. In these cordons the fruit is borne on or close to the main stem. Now the bark of this main stem is the great storehouse wherein food and nutritive matter concocted in or by the leaves is stored up. Of course it is stored up in the branches also, but obviously there must be more in the stem, so long as it is not encumbered or degenerate from age, than in the branches, and so the individual fruits in these cordons are proportionately finer and of better quality than those on standards. This much is proved by experience, and fits in with theory very nicely, but there is one point of practice about these cordons not so easily understood at first glance. Messrs. Cheal are emphatic in urging that in planting a cordon the tree should not be beheaded, but that the leader should be nailed on or tied to the wire and allowed to grow to the full extent required. Thus, say they, the lower part of the stem becomes furnished with fruit spurs, while, if the leader be shortened, the new growth assumes the form of wood-buds. And when the little cordons are well set with fruit spurs from the base upwards before planting they may afterwards be maintained in a fruiting condition by appropriate pruning. This pruning is effected in July, when the fore-right and lateral shoots are cut back to within two or three eyes of the last pruning, and the process is repeated in September. Whatever be the explanation the facts are obvious—the cordon Pears and Apples are furnished to the base with fruit spurs, and any aspiration that the tree might naturally have to form a trunk and air its leaves is brought into subjection by the use of dwarfing stocks and judicious pruning at the right season with root-pruning if necessary as a last resource. We ought to add that the selection of sorts is a matter of importance, for while some are complaisant and do what the trainer wants them to do, some are recalcitrant and refuse to comply with his wishes. After seeing what is accomplished we can only infer that ignorance is the obstacle to the non-accomplishment of the desired result in other cases, and that ignorance the intelligence and the daily accumulating experience of the growers and trainers are daily replacing by knowledge. Nescience gives place very rapidly under such circumstances: to science. *The Rambler.*

GERMINATION OF SEEDS OF THE VINE.—M. Nobe has ascertained that the number of seeds which germinate is proportionately small, and that the process of germination occupies weeks and even months. The seeds of the best varieties germinate freshly taken from the berries germinate best: drying of the seed diminishes the germinating power. There is no advantage in heating the soil to 15° or 20° C. (68° F.). A slight fermentation in the pulp acts favourably, but the same operation if continued for six days destroys the germinating power. The best temperature for germinating Grape seed lies between 12° and 15° C.

THE LAST OF SPIRANTHES ROMANZOVIANA.

GLAD indeed was I to see that, although no British botanist has publicly expressed a word of regret regarding the probable extermination of *Spiranthes Romanzoviana*, a distinguished foreign botanist, in the person of M. Naudin, of the Antibes Botanic Garden, has not only done so, but kindly offered practical suggestions for the future preserving of our rarer floral treasures. No doubt Mr. Naudin's idea for the preservation of rare plants by transferring them to private gardens or other safe grounds is excellent, and has already received attention in this country; but an equally good, if not indeed better plan, when we consider that rare plants are usually difficult to cultivate, is to try and by some means or other preserve them in their native habitats. That this is readily enough done will be pointed out further on, but first of all, with reference to the editorial remarks on the note I have already written (September 11, p. 346), allow me to explain, that by securing was not meant purchasing, the piece of ground on which the above plant grew, but simply securing or guarding it against molestation either by tillage or improvement, and which could have been readily enough done by a simple request from the persons I quoted. I much fear, however, now that you have expressed a doubt whether the Kew authorities could advantageously interfere in such matters, that but little interest will be taken in the preservation of our native flora, for if they, in the Botanic Garden of Britain, and from which have emanated our standard works on the British flora, can stand aside and see our rarer native plants becoming exterminated, well may other less interested persons imitate them. To say that a simple request from the Director at Kew to the owner of a piece of ground on which any rare plants grow to prevent this extermination, would be unheeded by any landowner in Great Britain or Ireland, I cannot think likely; and certainly a letter from that quarter would have greater weight than from any other I know of, and would neither occasion much loss of time or be attended with expense either. That such a plan would work well I will now give an example or two. Lately a request was sent to the agent, Mr. McIntyre, at Gwydyr Castle, in North Wales, and from a far less influential person in matters botanical than the head of the Kew Gardens, to save *Asplenium germanicum* and septentrionale from being totally uprooted, and a similar thing has happened not a mile from where I write. In the first instance, Mr. McIntyre caused it to be publicly notified that all trespassers in the grounds where the two plants grew would be prosecuted, and gave orders for a watcher who lived hard by to see that the order was stringently carried out, else by this time both these rare Ferns would have been things of the past in the Vale of the Conway. The other case I refer to was an old building on which grew a few specimens of a now nearly extinct British plant, and which were fast becoming less and less in number by the too pressing attentions of botanists and collectors; but, happily, this is not the case, for the agent of this particular farm was acquainted with the fact, the farmer asked to preserve it, who willingly complied with the request a long time ago. Judging from the rate at which it was disappearing, the individual specimens would either have been few and far between, or completely carried off.

Now I would suggest that Government empower some influential person in matters botanical, and I can certainly think of none better than the head of our botanic garden at Kew, to ask, as a favour or otherwise, the landed proprietors on whose estates rare plants grow to look after such; and even if it be found necessary, that a small sum be paid as compensation to the farmer on whose grounds a rare plant grows, to preserve it from extermination either by land tillage or at the hands of collectors.

Such might, perhaps, hardly have been necessary had the managers of our various botanic gardens acted in cases of this kind as Mr. Naudin has done in France. As something ought sooner or later to be done to prevent plant after plant being lost to our flora, suggestions from some of your correspondents who can devise a better plan than that set forth would certainly be of great value.

There is a chance, as Mr. Naudin suggests, of the *Spiranthes* again appearing in the cultivated ground, not, I fear, in the Potato ground, as he suggests, for that will be tilled for some green crop next season,

but in the portion devoted to corn, as that will, according to the usual rotation of crops, be under grass next year.

Arrangements are, however, being made for the ground to be searched, and likewise an appeal made to the owner to stay further cultivation of these particular fields, so it is to be hoped that the sweet little *Spiranthes Romanzoviana* will reappear, and perhaps little the worse for the trying ordeal through which it has passed.

In conclusion, I may inform you that there is no chance of Mr. Burbidge's specimen, from which your drawing was made, either increasing or multiplying, for when dormant it was thrown on the rubbish heap by an assistant gardener, who was unacquainted with the contents of the pot in which it grew. There are, however, four healthy specimens just now in my garden, perhaps the only remnants of the Cork plants, and for which I have to thank Mr. Gumbleton, of Belgrave. Let us hope that long may live and flourish in private, in "wild, wild Wales," the little plant that was "evicted," as you well put it, from its only known European station in the Emerald Isle.

This *Spiranthes* was discovered by Mr. J. Drummond, on August 3, 1809 or 1810, and is referred to in his original journal as follows:—"The following day I spent on Bear Island; I found nothing new upon it, but I found a very curious species of *Ophrys*, which I believe to be new, upon the mainland opposite the western redoubt, growing in a salt marsh near the shore; it was in very small quantity, I only found two specimens." No native plant has, perhaps, occupied the attention of botanists so much as the one in question. Both Lindley and Babington wrote special memoirs of it; Bentham contributed a paper on it: Smith got into trouble over its nomenclature—indeed, at the present time, botanists are still disputing over its name; while Gray, Darwin, and hosts of other eminent persons, have had more or less to say regarding its history. It was at one time cultivated in the Cork Botanic Garden, where it did well until rats put an end to its existence by eating the tubers. *A. D. Webster, Llandegai, Bangor, North Wales.*

Orchid Notes and Cleanings.

ORCHIDS IN THE OPEN AIR.

A. H. SMEE, Esq., The Grange, Charlsholm, whose experiments in this direction we fully noted last year, has experimented still more largely and successfully this summer. A general collection of *Masdevallias*, about 200 *Odontoglossums*, most of the *Lycastes*, many *Dendrobis*, *Oncidiums*, and an interesting collection of other Orchids have grown most vigorously in "My Garden" on the stages placed over the shady rivulets, many of the plants flowering there. *Odontoglossum madense* and *O. cirrosium*, which most growers affirm want warmer treatment than *O. crispum*, have strangely enough done the best of all in the open air in summer, the former being sturdier and greener than it comes indoors, and furnished with a stout spike of flowers. *O. cirrosium* also exhibits vigour of root bulb and leaf not to be surpassed.

ELLETIA VERECUNDA, R. Br.

Adverting to the note on this plant in the *Gardeners' Chronicle* of July 31, I may mention that this plant is generally distributed throughout the island of Jamaica, and I here offer a few notes which may be of assistance to British cultivators. The plants flower in profusion during the months of May, June, and July, and though sometimes found growing at lower altitudes, finds its most congenial home at elevations of 3000—4000 feet above sea-level, elevations represented by a mean annual temperature of about 65°—70° Fahr. The leaves are deciduous, and the flowers are produced on spikes borne on a peduncle some 24 or 30 inches in length, arising from the side of the naked tuber. It is found in best condition on sunny banks, where the rock is covered with only a slight layer of earth, and in positions where, in the season of growth, it receives an abundance of water, which can never become stagnant, on account of the sloping character of the ground. At times these places are well scorched by the sun, and become so

dry as to give the tubers quite a shrivelled appearance. The two latter facts, coupled with the proper temperature, will, I think, plainly indicate to cultivators the method of culture to be pursued to grow the plant successfully. *J. H. Hart, Gordon Town, Jamaica, Aug. 31.*

GUNNERA SCABRA.

OUR illustration (fig. 85) gives a good idea of the extraordinary vigour of this plant as seen growing this year in Sir Charles Nicholson's gardens at The Grange, Totteridge. The plants—for there are several of them—grow on the edge of a small pond at the bottom of a slope and alongside of a path; and the roots, although in a moist position, do not come into contact with the water. The leaves grew this season to about 7 feet in diameter; the first, which were destroyed by frost, had they remained uninjured would probably exceeded this measurement. The flower-stalks, of a greenish-brown colour, studded eventually with small orange berries, were about 3 feet in length, and are found lying prostrate on the ground. The plant is not quite so hardy, as was proved by the loss of two unprotected roots by frost last winter.

The best protection for the root-stock, which resembles that of the *Rhubarb*, is a thick covering of fresh tree leaves kept in position by sods. The *Gunneras* can be increased by seeds or divisions, and provided the soil is rich and moist, they are of the easiest culture.

Associated with the *Gunneras* were specimens of *Heracleum giganteum*, also with leaves of enormous dimensions, and flower-stems that reached heights from 12 to 15 feet; the whole group being exceedingly tropical in its exuberant appearance.

It may be said, as a warning to those inclined to grow the last-named, that it is a free-seeder, and can become a most determined intruder in dressed grounds.

DWARF TREE CARNATIONS.

THESE most valuable of winter-blooming plants form an interesting and instructive feature at the Messrs. Hooper & Co.'s nursery at Twickenham. The kinds grown are chiefly of French origin, and seem to possess a dwarf compact habit, so very diverse in character from what are usually seen in our ordinary Tree Carnations. At Twickenham the plants are grown in the open ground in beds all the summer, and when I looked in at the nursery a day or two since the potting up of the layers from the beds for furnishing saleable stock during the winter was just completed, and the lifting and potting of the blooming plants had begun. The soil there is naturally light and sandy, and to encourage close home or ball-rooting, when the young plants—which, by-the-by, consist of the smaller potted layers left over from the winter—are turned out in the spring, it is the rule to drop a handful of turfy loam into the holes made to receive the plants, and into this rooting takes place more readily than into the looser natural soil. As evidence of this peculiar result, as also of the light porous nature of the soil, the manager, Mr. Bruckhaus, using his hand as a trowel, lifted out a fine plant and showed the cluster of roots which had formed about the handful of loam. All these plants—many hundreds of them, in fact, stocky, robust, carrying three and four stems and many buds, but all as dwarf, comparatively, as those in bloom, did not exceed 14 inches high—were being got into 48-sized pots, and then into a cold frame, where, shut close down and slightly shaded during sunny days, they soon become established and bloom finely all through the winter. Tree Carnations in this admirable state of development cannot well be said to need forcing, they simply want a moderate growing temperature with ample light and air to keep them in good bloom. Amongst the kinds grown were some few striking ones, which being on trial may not be mentioned now, but another year, when fully proved, very likely they will merit approval. It is worthy of remark that these French kinds show numerous lemon or yellow grounds, and much of that flushed or suffused coloration of petals which is now not so inaptly known as *terra cotta* hues. These seem even more beautiful in the winter than now or in the summer, the colours being more pleasingly displayed. All the same for general purposes, rich defined self colours seem the most valuable and useful. Of these, very beautiful even with the early blooms outdoors are Mademoiselle

Carle, pure white, capital habit, and free, probably the best white kind yet seen; Irma, beautiful clear rose, dwarf and free; Souvenir de la Bruyere, rich carmine, and robust in habit; Raspail, fine deep scarlet; Dr. Raymond and Filatol, both very deep crimson, the former presenting a compact and free form of the old crimson Clove. Of parti-colored flowers singularly pretty are Belle Lyonaise, lemon ground, and having deep rose flakes; Jean Sisley, dwarf and free, flowers creamy-white heavily flaked with reddish-scarlet; Claude A. Comte, lemon ground heavily flushed with magenta-red; Zouave, very robust habit, flowers white striped or flaked with scarlet; Madame Mascault, one of the *terra cotta* style, flowers pale yellow ground flushed with rose; and Brisson, very dwarf habit, and exceedingly free bloomers—flowers white flaked with rosy-scarlet. These comprise a selection of the more robust forms as seen in the open ground, but there are many others better known perhaps, and therefore less necessary to be mentioned here. It is possible that some which present more delicate habits in the open may, however, be good bloomers in warmth during the winter. There is one difficulty connected with Tree Carnations that does not occur with all other flowers. Their special value is found in their fitness for cutting to employ for buttonhole or bouquet purposes; hence, as the flowers are removed almost as soon as they are fully expanded, a show of flowers can only be found where some are specially preserved. It is not their capacity to produce showy heads of bloom, but rather their power to produce a long succession of flowers, which renders tree or winter blooming Carnations so valuable. Referring to those kinds found at Messrs. Hooper & Co.'s nursery the term Tree Carnations perhaps unfairly applies, because of their dwarf compact habit. No doubt the appellation, winter bloomer, is the more consistent term to apply and the more truly descriptive of their merits. *A. D.*

T O B A C C O .

THE following extracts are taken from a pamphlet written by Sir William Robinson, K.C.M.G., the Governor of Trinidad. We omit those portions which are of purely local interest merely expressing our hope that the West India planters will avail themselves of Sir William's suggestions, and of the many hints which have been given them by Mr. Morris, now Assistant Director at Kew, for the development of their resources. To Mr. Morris the Governor dedicates his pamphlet in the following strain:—

"In this short pamphlet I have endeavoured to popularise a 'Minor Industry' in which I have ever felt an unusual interest.

"I dedicate it to one who has done more than any other living man to foster the so-called 'Minor Industries' in Jamaica, and to direct the attention of residents in other West India islands to the absolute necessity of extending and developing agricultural enterprise."

The history of Tobacco in England is both interesting and somewhat amusing. As every one knows, or ought to know, we are indebted to Sir Walter Raleigh for this popular product. In 1585 he introduced it into England, and having an eye to business he persuaded "Good Queen Bess" to give him a patent for the possession of Virginia, from which excellent supplies have been, and are still, procured. The first Tobacco plant grown in Great Britain was imported from Virginia. Raleigh, not satisfied with his property in America, obtained from the Virgin Queen, in addition thereto, 12,000 acres of forfeited land in Cork and Waterford, on a portion of which the Tobacco plant was afterwards regularly cultivated.

Raleigh was a courtier—a gentleman of position and great influence—and it is not surprising that the habit of smoking which he adopted became very fashionable. We accordingly read in one of his biographies that the "ladies and great and noble men" of Queen Elizabeth's Court "would not scruple to blow a pipe sometimes very sociably." At Sir Walter's house in Islington he frequently entertained his guests with a "mug of ale with grated Nutmeg and a pipe," and I have no doubt that when in less prosperous times he was confined in the Tower of London, he had recourse to the grateful weed, though he may have been robbed of his beer. Elizabeth's successor, James I., "was a Goth," or, what to us smokers is the same thing, an anti-tobaccoist. He was dis-

gusted with the "precious stinke" of the pipe and cigar, and did his "level best" to put down the habit of smoking amongst his long-suffering subjects.

In 1604 (let this be a warning to colonial governors), in a most unconstitutional manner, without the consent of Parliament, he issued a warrant raising the tax on Tobacco from 2*d.* to 6*s.* 10*d.* for every pound value.

But if the memory of James I. is anatomised by all smokers, his action was absolutely mild when compared with that of Pope Urban VIII., and that of the King of Persia and Czar of Muscovy. The Pope threatened excommunication to all using Tobacco in churches—certainly an unseemly and intolerable practice, but the King and Czar forbade its use under pain of death, with the pleasant alter-

Camden, in his *Annals*, asserts that in the reign of the first Charles Tobacco was highly prized, "both as a recreation and a health restorative."

We smokers are much indebted to Lord Baltimore for the fillip he gave to Tobacco cultivation. In 1633 he emigrated to Maryland with 200 persons, who were specially encouraged to cultivate the industry which has been maintained there ever since. Great quantities were grown in England in the middle of the seventeenth century, but of course the psalm-singing Rump Parliament prohibited its growth. The smokers, however, were too stroong for Cromwell, and also for Charles II., who, vicious as he was, might have permitted his loyal subjects to indulge in the little vice of smoking, if it is one.

efforts are being made to restore its cultivation in the United Kingdom. Truly it may be said, in reference to the "noxious weed"—*Tempora mutantur et nos mutantur in illis.*

Curiously enough, in the reign of George III. the practice of smoking was well nigh superseded by the practice of snuff taking.

With reference to snuff, at that period, Wesley, in his *Poems on Several Occasions*, observes:—

"To such a height with these is fashion grown
They feed their very nostrils with a spoon."

Latterly smoking has, in my opinion, been happily revived. It has found a steady supporter in the future King of England. Except with the object of securing

FIG. 85.—A BOLD FOLIAGE-PLANT: GUNNERA SCABRA AT TOTTERIDGE. (SEE P. 424.)

native of having the nose cut off for enjoying it in the form of snuff.

But these potentates could not stem the tide. James soon found this out, and, with an eye to the main chance, cannily changed his tactics. He saw there was "a tide in the affairs of man, which, taken at the flood, leads on to fortune," so he took to himself the pre-emption of all Tobacco imported. He also decreed, with a view of putting money in his purse, that only those holding his letters patent should be allowed to import.

It is perhaps not generally known that Charles the Martyr began his reign in 1625, to all intents and purposes, as a Tobacco merchant and monopolist. The fact remains, however, that all Tobacco not grown in Virginia and Bermuda was seized for his benefit, and that 50,000 lb. of Spanish Tobacco were bought by himself and resold to his subjects.

In 1650, by 21 Carl. II., chap. 34, Charles, simply to increase his own pocket money and to furnish means for his expensive habits, issued a legal prohibition against the cultivation of Tobacco. Smokers were not to be daunted, however. He could not put their pipes out, for the Yorkshire men pursued the industry with characteristic stubbornness, and, notwithstanding persecution and prosecution, Tobacco and smokers gallantly held their own.

In 1782 a descent was made on the York cultivators. All their stock of Tobacco was seized and publicly burnt, and the dealers were mulcted in penalties to the amount of £30,000. Even as late as 1831 were Tobacco cultivators harassed. William IV., of whom better things might have been expected, in that year prohibited its growth in Ireland. I think I am right in saying that at the present moment great

a good sneeze after dinner the somewhat unclean habit of snuffing is a thing of the past.

CULTIVATION.

For general information and guidance I would state from my own experience the following facts:—

1. Any ground intended for the growth of Tobacco should be cleared of bush by the end of July at latest. The bush should be cut as low as possible, and the stumps extracted if practicable.
2. Seed should be sown in the middle of the month of August and not all the year round as is probably now the case.
3. Every plant before being transplanted must have six leaves on it, and those leaves should be as large as a half-dollar piece before it is removed from the nursery.

4. When transplanted, a distance of 18 inches should be allowed between each plant.

5. Tobacco plants are sometimes attacked by insects in November. This, however, depends upon the state of the weather. The plants should be carefully watched, and the insects, if any, picked off.

6. As soon as suckers present themselves they should be ripped off; they will be found between the stem and the leaves. By this operation the vigour of the plant, which should not be allowed to flower, is increased, and the condition of the leaf improved.

7. Tobacco flourishes best on level ground, and red or reddish soil is preferable to any other. If the spot where it is cultivated is at all hilly, the northern portion of the ground will be best, as in that position the plants will suffer less than in any other from the rays of the sun.

8. Vegetable manure will be found an admirable fertilizer, and it will be necessary to dress the ground every two years, as the plant exhausts the soil very rapidly.

9. Care should be taken, in sowing the seed for transplanting, not to sow too thickly.

CURING.

10. The curing of Tobacco—and everything depends upon the curing—is a very delicate operation, and one requiring great care and attention. The most common practice, when the leaves are fit for gathering, is to cut the stems of the plants close to the ground and lay them on beds to dry until the evening. They should then be carried to a drying house, which should be thoroughly ventilated, laid in heaps 15 "sweat," covered with mats to keep in the heat, and left for several nights to soften and bleach. The leaves—and no more than twelve should be allowed to grow on each stem—should when supple be stripped from their stems, strung together on packthread and then hung across the drying house: sufficient room for the air to circulate among them must be allowed. When dry the leaves should, in damp weather, be placed on hurdles in heaps and left for a week or two. During this time the leaves should be frequently examined and turned with a view of preventing undue fermentation. When fermentation is complete the leaves should be sorted according to their different qualities, redried, tied in bundles and pressed.

11. It is necessary in the case of those intended for export that the bundles should be compressed into a solid mass and the air excluded from them.

12. In Jamaica, Cuban, Chinese and native labour is employed in the cultivation of the plant, but Cuban and Chinese labour alone is employed in the manufacture of the leaf into cigars.

13. The cultivation of two acres of Tobacco should cost about £30 and the average produce should be worth £80, leaving a nett profit of £50.

The Director of Kew Gardens informed me four years ago that with "proper methods of cultivation and preparation Tobacco might become a very important article of export from the British West Indies."

If any one should doubt the correctness of my rules let me say, though it may appear egotistical, that Sir Joseph Hooker observed that "Governor Robinson's excellent despatch" (from which they are taken) "really leaves little room for further remark. It is of course desirable to obtain seed of good quality, though this is of less moment than careful attention to cultivation and preparation. Governor Robinson's statement that the finest Tobacco in the world may be spoiled by improper or inefficient curing cannot be too much emphasised." Looking to the fact that Spanish colonists in two distinct parts of the world, east and west, grow Tobacco with pre-eminent success, it certainly is difficult to understand why we should not have been done with it by British enterprise.

VINE MANURES.—As a result of observations made in Germany, it appears that superphosphate of lime increases the yield, hastens the ripening of the Grapes, and facilitates the ripening of the wood. Nitrogenous manures are useful when the Vine lacks vigour, otherwise they do harm by stimulating growth rather than fructification and maturity. Potash by itself is of no value, but when conjoined with phosphates and nitrogenous manure it is very serviceable.

Florists' Flowers.

PERPETUAL FLOWERING CARNATIONS.

The plants produced from spring-struck cuttings are now of considerable size. They are also showing their flower-buds, and as soon as cold, wet weather sets in, they ought to be removed to the drier, warmer atmosphere of the greenhouse or intermediate-house. During the recent hot weather greenery may have attacked them; if so, they will be found clustering round the flower-buds; fuming with tobacco-smoke will destroy them, and not injure any buds or open flowers. Some flowers, such as Pelargoniums, are much injured by smoke, but the most delicate glistering white *Picotée* is none the worse for repeated fumigations.

THE PINK.

By this time the young plants raised from cuttings (piping is the professional term) in July are now ready for planting out. This ought to be done this month before the soil is saturated with the autumn rains. The bed should be prepared by deep trenching and manure: it ought to be 18 inches deep, but this depth must not be gained by throwing up bad subsoil to the top, and burying the best soil in the bottom. I write on the assumption that the ground has been trenched and trenched again until the surface soil and subsoil have been incorporated. It is very desirable to place 2 or 3 inches of prepared compost on the surface of the bed before planting.

Forcing Pinks should be large tufts by this time, large enough to be lifted and planted in 6 inch pots; for this purpose the compost used to replot the Carnations will answer admirably. The plants must be carefully lifted, with as many as possible of the roots attached, and any worms that may be lodged amongst them should be removed. Treat the plants the same as advised for Carnation layers until they are well established, when the lights may be drawn off night and day in fine weather.

PANSIES.

Now is the best time to plant out for spring blooming, and it is well to remember that the Pansy loves a rich soil and the careful hand of the gardener. Plenty of cow-manure and leaf-mould is what the Pansy delights in. The plants are also so very brittle—the least awkward touch, and they snap over at the neck. They are never safe until they are pegged down; this induces young growths from the base of the plants as well as from the point which will turn upwards at the peg. No more need be said about them, except to urge watchfulness, as the leather-coated grubs, slugs, and wireworms are all *connoisseurs* of the Pansy.

THE RANUNCULUS.

This is considered to be the best month in which to sow seeds. Sow in boxes of any convenient size, and 6 inches deep. The seeds should be sown thinly, and be covered to the depth of one-sixteenth of an inch. The boxes should be well drained, and over the drainage a layer of fibrous turf should be placed. Loam two parts, leaf-mould one part, and one part of sandy peat is good material to fill the boxes with. The surface should be made quite level, and the seeds covered with finely-sifted sandy mould. Place the boxes in frames; keep the soil moderately moist, and admit air freely. The beds ought to be prepared now, for planting out the tubers in February. I mean, of course, the tubers that may be purchased now, or that were dug up in August. We left ours in the ground longer this year, and only a very few had started to grow. One or two seasons I had them dug up rather too early, and they failed next season. This lovely flower is not grown so much as it ought to be. The roots are far too cheap to yield a profit to the grower. The finest tubers, and best varieties can be purchased at 2s. 6d. to 5s. per 100—the best Scotch spotted varieties to name at that price. Fifty years ago that price had to be given for single tubers, now varieties a guinea each: five hundred or a thousand tubers may be purchased now for that sum. I advise those who have never grown Ranunculuses to send for some when ordering the bulbs. Twenty shillings-worth will make a good bed, and the tubers will increase three or four fold for next season.

THE TULIP.

The growers of these stately flowers are certainly increasing in numbers. We are not likely to have a Tulip mania again, nor is it desirable; but a place in every garden should be found for the good old-fashioned Tulips of the florists. They can be obtained from the northern florists, or of an interior strain, but good enough for ordinary purposes, from any dealer in Dutch bulbs; they are as cheap as Ranunculuses. The Tulip bed ought now to be prepared. If the preparation is delayed later, the ground is generally too wet for them to do well. Have some good compost prepared to place on the surface before planting. Pure turfy loam is as good as anything.

THE CALCEOLARIA.

It is now a good time to replot all seedlings and propagated plants into those in which they are to pass the winter. They must not be over-potted, and some idea as to the size of the pots in which they are to flower must be present to the mind of the cultivator. A plant intended to flower in a 7-inch pot should now be replotted into one of 5 inches; and larger specimens that would fill an 8½-inch pot should be placed in one 6 inches in diameter. If the plants are free from insects, that is no reason why they should not be fumigated with tobacco-smoke once every five or six weeks. Healthy, well developed leaves cannot be produced if greenfly gets a footing. The plants ought now to be placed near the glass in a house from which frost can be excluded, but the heating apparatus must not be used unless it becomes necessary to do so; as the plants are very impatient of heat in the winter season. I like to go into the house in the morning, and find the leaves stiff, and sparkling with a row of tiny dewdrops on them. Those plants that are sufficiently advanced should have the centre pinched out. This is best done when they are in vigorous growth and no more pinching is necessary.

THE CINERARIA.

Those who can grow Calceolarias well, will be sure to be successful with the Cinerarias. We prefer this to the other and grow several hundreds, which are now in various stages of development. As I write we are replotting the plants into pots in which they will pass through the winter; and the size of the pots is much the same as those the Calceolarias require. It must not be forgotten that they both make good growth during the winter months. We pinch the centre out of the plants whether they have been propagated by means of seeds or cuttings, and they speedily make strong lateral growths; the right thing is to pinch them, when they are established and growing freely.

The potting soil for both is decayed turfy loam: to four parts of this add one of peat or leaf-mould, one part of decayed cow-manure, and one part of sand. Do not be too free with the water-pot, especially when the plants have been recently reotted. Owing to the dry weather mildew has been troublesome on various plants and shrubs in the garden, and may spread to the Cinerarias; if it does, it may be removed by dusting with flowers of sulphur, a very slight powder puff on the leaves with a sulphurator will destroy it on its first appearance, but when it has spread much it requires a good deal of this material which renders the leaves unsightly, but this has to be put up with, as the lesser of two evils. Nothing destroys this parasite so effectually as flowers of sulphur.

THE CHRYSANTHEMUM.

Sharp frosts may be expected early this month, and to make sure that the flower-buds showing colour are not injured it is best to put the plants into the house where they are to open their flowers. When frosts have set in suddenly we have had to lay the plants on their sides, and throw a mat or some other covering lightly over them. It is not safe to leave them outside after the second week in October. Supposing the plants are quite free from any aphides, they are not likely to be free from mildew. See that they are well dusted with flowers of sulphur before taking them into the house. Those who wish to obtain first-rate blooms for exhibition of the incurved varieties, would do well to get the blooms, or rather the partly developed blooms, as near the glass as possible. Some varieties such as Mrs. George Rundle and varieties from it, will not produce coarse blooms even under unfavourable conditions, but some,

such as John Salter, Bronze Jardin des Plantes, &c., are almost sure to produce coarse blooms unless they are within a foot or so of the glass roof, and well exposed to the sun and air. Artificial heat is not needed, unless it is to dry up the water that may be spilled; and this is best done in the early part of the day when the ventilators are open. Those who have been accustomed to exhibit know how annoying it is to have their best blooms injured by the decay of some of the outer petals; but it will happen even with careful management. As soon as any of them show signs of decay they are best removed at once with a pair of tweezers, to prevent the decay from spreading to the others. The decay of the outer petals sadly mars the beauty of the blooms. At p. 203 I urged the importance of the specimen plants being trained naturally. The growths must be supported with sticks, and this may be done any time in September; ours have just been finished (the last week in the month). The large-flowered and the Japanese varieties require sticks; the pompon varieties very few or none at all. Those plants that are grown to produce large flowers for exhibition require very tall sticks. The Japanese and Chinese are much the same in this respect, and even the Anemone pompons will grow as tall as any of them, when grown to produce large single blooms. Give sufficient water at the roots, and avoid excess. Some persons are so careless in watering that they apply so much that some of it runs over; this is not only waste, but the unnecessary moisture is injurious. *J. Douglas.*

NURSERY NOTES.

SAWBRIDGEWORTH.—This name can only suggest the nursery of Mr. Rivers, made famous by three generations of fruit cultivators, especially of fruits grown on the restricted root methods. Peaches were not nearly over in the long span cool-houses, but only late kinds were ripening, at the time of our visit, the early kinds having been all gathered. Most of the trees were in pots, but a few old veterans of thirty years or more had been accommodated in the side borders, with the idea of rejuvenating them, and so thoroughly had the operation answered that it was difficult to distinguish the fruit from others taken from young trees in their first flush of bearing. Amongst those carrying fruit we noted Lord Palmerston and Prince of Wales, both excellent in flavour, as grown; very fine also was the Nectarine Peach, a hybrid from the Stanwick, but which has not the fault of cracking like that kind—a fault aggravated in many cases, both in this fruit and in Grapes grown in pots, notably the Madresfield Court, by watering the plants in the evening instead of in the morning—the evaporation from the foliage during the hours of daylight getting rid of the major part of the moisture drawn up by the roots. The Nectarine Peach, although of a red colour next the stone, is white-fleshed, and is deliciously aromatic in flavour. Whatever may be advanced against the method of growing these hardy fruits under glass, it is to be recommended in all northern, cold, windy, and moist localities, in preference to walls. The trees bear well. If there is a flow and return 1½-inch pipe in the house there is immunity from spring frost; the insects affecting the trees can be readily destroyed; the house makes a pleasant promenade at almost any time; the fruits can be reached without a ladder; and when it is said that nails, shreds, and ties are not needed at all, and that expensive borders are likewise superfluous, enough has been said to show the advantages of cool glass-houses for the culture of such fruits as are usually attached to walls for the extra warmth there afforded them.

The Pears growing in similar houses to those in which stood the Peaches were loaded with fine fruits, although the pots were not more than 10 inches in diameter in respect to the largest of them. Surface feeding with manure and loam is practised with all the Pears, and to keep this mulching or top-dressing in its place the expedient is adopted of driving in broad labels or small pieces of slate around the edge, and by that means actually increasing the height of the pot by 4 or 5 inches. The plants are put outside when ripening their fruits, the fuller exposure developing their flavour perfectly. Of Doyenné du Comice, Clapp's Favourite, Beurré de l'Assomption, Madame Treve, Souvenir du Congrès, Gratiaoli, Doyenné Boussoch, specimens of 4 feet in height were

noticed with from eight to twelve fruits each of a large size.

Pears in pots admit of a great many kinds being grown, if that is desired; and in that way, when selected with regard to the season of ripening, plus of fruit could be avoided; and with 200 to 300 pot trees, dessert fruit could be served during eight months of the year. We know large gardens that cannot do so much as this, although possessing acres of wall space.

Plums were almost past in the houses, and with the abundant crop outside they seemed to have less interest this year; but we have many years in succession when the Plum is conspicuous by its absence, it is then the little trees in pots prove their usefulness. The Bryastone Gage, Transparent, Violette de Galopie, a rich, juicy, purple Plum; and the Jefferson were delicious. To defeat the wasps and flies the trees can be buddled up in muslin.

The houses of Black Alicante Grapes were superb, the bunches numerous and large, and the colour and bloom unequalled. The Gros Colmar approached these almost in all good points, but were less heavily cropped. Mr. Rivers has "taken it out" of his Masot of Alexandria in former years, and they are now retaliating by shanking at a great rate. Duke of Buccleuch was a capital crop of short compact bunches.

The appearance of the nursery stock out-of-doors was just what might be expected at this famous fruit centre, but there was an innovation on old practice observed in cordons that were being prepared for sale; that is, that they receive but one pruning whilst in leaf, and that takes place in September, leaving but a small amount of pruning necessary in the winter. The result is abundance of good fruit-buds in place of the weak ones and numerous wood-buds produced by the constant pinching advocated and practised formerly. A good system of fruit tree planting well adapted for small, or, indeed, any gardens, was observed in a quarter planted 6 feet apart each way with upright cordons—Pears, Plums, Apples interlined with Gooseberries and Currants, the two latter kept at not more than 3 feet in height. So long as only dwarf subjects that do not crowd the cordons are used as the interlining ones it matters little what is planted, so that the ground is not rapidly exhausted. Violets, Roses, Strawberries, salading, &c., would all be suitable.

TREES AND SHRUBS.

HOLLIES: GOLD AND SILVER VARIETATED.

WITH us all kinds of Hollies do well, the soil being a light sandy loam, which suits them admirably, but especially noticeable is the Golden Queen and the silver variegated, as they produce such quantities of short sprigs of the pure gold and silver sport, both in leaf and stem. I do not remember to have seen such large quantities of this for some years past as in the present season, a dry season being more conducive to this growth than a wet one. The variety of purposes to which this can be put makes it invaluable through the winter months. It is much sought after for the Christmas decoration of the churches in this neighbourhood, and I also use it largely for dinner-table decoration. With this we use a pale blue silk cloth laid along the centre of the white one on the dinner-table, using the short sprigs of this Holly to edge the blue one, and also to lay about on this cloth; and with silver cups filled with yellow Chrysanthemums on rather long stems, with plenty of foliage interspersed, when lighted up has a most pleasing effect, and makes a good variety among dinner-table decorations. I also use it largely for vases amongst cut flowers; for this purpose it is also very effective.

PINUS PINASTER.

We have a handsome specimen of this growing on one of two islands in a lake of 32 acres. It is fully exposed to all the winds and storms, is from 60 to 70 feet high, and girths 10 feet 9 inches at 3 feet from the ground. We have many good specimens of this variety in other parts of the pleasure-grounds, but none to equal the one under notice. *Edward I Ward, Havel Gardens, Bromsgrove.*

CALOPHACA GRANDIFLORA.

A shrub with long puberulous pinnate leaves and

long, straight, many-flowered racemes, pedicels about as long as the yellow papilionaceous flowers. Native of the Anu Daria district, where it was discovered by Albert Regel, who sent home seeds which have been distributed from the St. Petersburg Botanic Garden. It is likely to prove a hardy shrub, of a very ornamental character. A description and coloured figure are given by Dr. Regel in the *Gartenflora*, September, t. 1231.

SINGLE BEECHES 7. BEECH IN LINES.

Can you or any of your correspondents inform me why the Beech when planted as a hedge tree retains its leaves until the following spring, while single specimens, or those in the nursery border, shed these at the usual time in autumn? It is not the effects of pruning, as we have here single specimens pruned closely in that shed their leaves; neither is it caused, as one would naturally think it might be in the case of a close fence, by the shelter afforded to one by the other, for I know of a Beech hedge of 8 feet high, planted on an exposed mound where the worst winds blow, and where no shelter is afforded, that is as full of leaves at Christmas as it is at midsummer. *Emergo*

MAGNOLIA FUSCATA.

Can any of your readers inform me if a larger plant of Magnolia fuscata exists in these islands than the one at the Earl of Kimberley's, Kimberly Park, Wymondham, which is at least 10 feet above the tub and 7 feet through? Mr. Wainwright (the head gardener) treats it just the same as his large specimens of Orange trees (which, by the way, are loaded with fruit), namely, by keeping it out-of-doors all the summer, and in the orangery during the winter months. *J. G. Hill.*

A NEW VARIETY OF CRAB.

We send you by this post fruits and shoots of a Crab of which we received the seed from Russia a few years ago. It appears to us distinct from anything we have hitherto cultivated. The tree is of free strong growth, and, as you will see, fruits freely. Last year was the first season of bearing. As the season advanced the fruits became almost black. They are now deep crimson, and of a distinct oblate form. *James Buxhouse & Son.* [A variety of *Pyrus malus pranifolia* of a crimson colour, the fruits an inch in diameter by three-quarters of an inch in the lesser diameter, the fruit-stalk very slender, and about 1½ inch long. *Ed.*]

PICEA AJANENSIS.

This note on *Picea Parryana* glauca at p. 404 tempts me to recommend this much prettier Spruce Fir. We have both growing together in our garden, but the Japanese species is of freest growth, and the silvery sheen of the undersides of the leaves is most pleasing. I believe it is perfectly hardy. *Abies Alcockiana* (Hort.) is a synonym of it, the true *A. Alcockiana* being a taller growing tree. No collection of coniferous trees should lack either of these. I wish we could say this has been a wet season. Our ground is now parched for want of water, but this suits the Japanese Conifer. *J. Douglas.*

CEDARS OF LEBANON AT BAYFORDBURY

There are eighteen fine Cedars growing on the lawns and in the shrubberies at Bayfordbury, besides many large ones about the park. Of the eighteen growing about the gardens, ten were planted in 1765, being then nine years old, having been raised from cones of a Cedar then growing at Enfield, and still in existence there. An accurate account has been kept of their growth, and periodical measurements up to the present time, which shows their increase in girth of the stems in the later years to have averaged about 1 inch annually, and they are all now in vigorous health. These Cedars vary much in their habit of growth, and in most of them the branches commence at 8 or 10 feet from the ground. The measurements of girth taken at 7 feet show at the present time 18 feet 9 inches for the largest of the ten trees, down to 15 feet 1 inch for the one represented in the photograph, where it will be seen that in the other two trees the branches commence very low down, and the girth immediately below them is about 25 feet. The spread of their boughs, which rest upon the ground all round, is very great, and in a longitudinal measurement of the two trees covers an extent of 150 feet, the stems of the trees being 60 feet apart, with their branches interlacing and forming a large shady hall, often used

for summer gatherings. This group of three trees is situated on the south-east side of the lawn at Bayfordbury. *W. R. Baker.* [A fine photograph accompanied this publication, and which we may reproduce on a future occasion. Ed.]

CONES OF PINUS MACROCARPA.

The six cones of *Pinus macrocarpa* represented in the photograph are a portion of eleven cones, which have just been taken off a tree in the Pinetum at Bayfordbury, with some of the branches which it was necessary to cut in order to obtain the cones, the sight of which when lying altogether on the ground was very striking. The total weight of the six in the photograph is 16 lb., and that of the largest cone 3 lb. They were all growing near the top of the tree, which is about 40 feet in height, and it is the third year since the cones were first formed, which appears to be necessary for their full growth. There are two larger specimens of *P. macrocarpa* in the Pinetum, which have never yet coned, and this inclines me to consider the one in question as a variety, probably the one which goes under the synonym of *P. Coulteri*, as its foliage is much finer, and it has coned freely for many years. I shall be glad of the opinion of others who may possess cone-bearing trees on this point. I would observe that the cones in the photograph are not exactly in the position which they held on the tree, although nearly so, and show the way in which they are attached to the branches from which they require a saw to detach them. *W. R. Baker.* [Two full-sized illustrations of these noble cones were given in our columns, 1885, March 28, pp. 409 and 413. Ed.]

MESSRS. JAMES VEITCH & SONS' SEED GROUNDS, TURNHAM GREEN.

TRAVELLERS by the London and South-Western Railway passing Turnham Green station have doubtless noticed a piece of ground facing the station which, especially during late summer, is very gay and neat with subjects possessing attractions and interest for those of a horticultural turn of mind.

Here is one of the trial grounds belonging to the firm, whereat are tested the novelties and varieties of flowers, &c., put into commerce by them. Asters have been a conspicuous feature this season, imparting quite a glow of varied colours. The Victorias were represented by a fine strain. They are perhaps the most showy and massive of all the Asters, bearing enormous flowers of great fullness, grand for exhibition purposes, producing from twenty to twenty-five flowers on each plant; height of plant $1\frac{1}{2}$ to 2 feet.

The dwarf *Chrysanthemum* flowered variety is a very useful one for edgings, beds, and pot culture. It is of low growth and stiff habit, and very free-flowering, 9 to 12 inches in height, bearing from fifteen to twenty flowers on each plant. The individual flowers are large, often reaching 4 inches in diameter, and belonging to the flat-petalled class.

The pompon imbricated Asters form a charming free-flowering class of compact, neat, branching, pyramidal habit, the growth of the plant being $1\frac{1}{2}$ to 2 feet high, most useful for cutting; the flowers, although small, are of excellent form and the best imbricated of all.

Truffaut's Improved *Pæony* Perfection is a large incurved variety, fine for exhibition purposes. It is of fine form and symmetry, the flowers are $3\frac{1}{2}$ inches in diameter and very double. The plant is of pyramidal growth, $1\frac{1}{2}$ to 2 feet high, very constant in height, and bears about twenty to thirty flowers.

Of those well known and most admired plants, Stocks, a fine display was to be observed. In the Ten-week or early flowering section, the large-flowering variety holds the first place, producing plants of compact and robust growth about 1 foot in height, which yield fine large spikes of bloom that endure for a long time. The intermediate section of Stocks forms a succession to the above, coming into flower two or three weeks later, and frequently remaining in bloom till destroyed by frost. The plants are of dwarf habit, very free-flowering and double.

A new forcing variety, appropriately named Snowflake, was noticeable. It is valuable on account of its being admirably adapted for forcing, thus being got into bloom when white flowers are scarce. It produces a vigorous main spike of large and very double snow-white flowers, and when well grown, a number of flowering side shoots.

Those attractive half-hardy annuals, Zinnias, have been a special feature this season. Being of easy culture, they should be grown extensively in all gardens.

To those with a fancy for the gaudy Sunflower, the new miniature form is a welcome addition. It produces an abundance of small bright golden-yellow single-petalled flowers with a dark disc—very decorative, useful for cutting purposes.

A subject to attract attention was a fine strain of *Lobelia speciosa*; the plants, which have been carefully selected and grown from cuttings, are dwarf and compact in habit, very profuse and continuous in flowering, and of a beautiful rich dark blue colour. *R.*

MASDEVALLIA DAYANA.

THIS very singular plant is an ally of the windowed *Masdevallia* (*M. fenestrata*), sent over by Mr. Purdie from Jamaica in 1843, and which bears dull purple flowers, about one-third the size of those of our illustration (fig. 86). Both have much the habit of *Restrepia antennifera*, their sheathed stems and manner of producing their flowers from the one at the base of the leaf strikingly calling to mind that plant. *M. Dayana* forms a compact tuft with *Restrepia*-like leaves, often 4 inches by 3 inches in a well-grown specimen, such as that which Sir Trevor Lawrence was awarded a Botanical Certificate for at a recent meeting of the Scientific Committee of the Royal Horticultural Society, and

FIG. 86.—MASDEVALLIA DAYANA: A FLOWER, PURPLE-SPOTTED.

from which our illustration was taken. The upper sepal, which is yellowish-white with irregular purple spots, has seven low, longitudinal membranous keels. It is joined to the inferior orange and brown connate sepals at the tip, the internal structure of the flower, which is very curious, becoming visible through the openings at the side. *M. Dayana*, which flowered first in 1875 with John Day, Esq., of Tottenham, is a New Grenadan species, which thrives best in a shallow pan or in a basket suspended with the *Masdevallia* chimera varieties, and treated in a similar manner.

JARDIN DES PLANTES, ROUEN.

THIS garden, which is partly a botanic garden, has been established for a period of about half a century, having been at first a private establishment belonging to a Mr. Calvert, an Englishman, and as such was laid out and partly planted by Mr. Wood, who was sent over from the Chelsea nurseries (which were at that time in the hands of Mr. Knight) for that purpose. Mr. Wood remained in charge for about eighteen months, when, from various circumstances, he considered it better to resign his place, and started a nursery on his own account. To this nursery we hope to refer shortly. The Town Council of Rouen found it convenient to buy up the place, and secured it as a public garden for the town. Quite lately a new plot of land has been purchased and added to the original piece, and altogether the extent of the garden is about 10 hectares (about 25 acres). The new part has as yet nothing in it, but if it is laid out and planted in accordance with the rest—and there is every reason to believe that it will be—a fine garden will be the result, of which the

townsfolk of Rouen may well be proud. The soil here is not by any means rich, sand being too abundant, and in many places we were assured the fertile soil is not more than from 6 inches to 1 foot in depth. There are no specimen trees of very large size, but the Conifers which are to be seen are of excellent shape and form, and appear to be extremely healthy, especially *Sequoia gigantea* and *Abies Pinsapo*. Limes and Chestnuts are largely planted, forming avenues, and there is also a fair proportion of Sycamores. The Limes are not as healthy as could be wished, but the Chestnuts are perfect marvels of beauty. *Pavia macrostachya* grows very well, and when seen as it was at the time of our visit—about a month ago—full of flowers; it is truly a handsome plant. There are large numbers of Mosses planted out in the beds, which tend to give a tropical appearance to the place, but, unfortunately, they are in some instances very much cut and torn by the winds. The beds are almost all carpet-beds, and are well designed and executed, one being the arms of the city of Rouen—but we will not enter into a minute description of them. Other beds are filled with the usual "bedding stuff," including Cannas, which are remarkably healthy; Pelargoniums, Phloxes, Dahlias, Ageratum, Marguerites, &c. The greenhouses, which have only been erected about a year, are built on a good plan; there is a corridor with the different houses, seven in all, running off from it on the south side; against the other wall various plants are trained, but Begonias and *Tropæolums* chiefly. There is nothing of a very rare or extraordinary character, but everything in the houses presents a remarkably clean and neat appearance. Achimenes are especially well grown, as are also Gloxinias and Begonias in variety. One house struck us as being particularly gay with these plants; grand specimens of *Begonia corallina*, *B. metallica*, and others, but chiefly the former, are trained up the posts supporting the roof, attaining a height of sometimes 10 or 12 feet, and being laden with their very abundant rich coral-red flowers, have a most attractive and gay appearance; this *Begonia* is very floriferous, and should be largely grown. From the roof are suspended several Orchids, which however, with a few exceptions, were not in flower at the time of our visit. The best flowering specimens noticed were *Vanda suavis*, a very good plant; a fine form of *Cattleya Eldorado*, and *Lælia Lindleyana*. Another attractive flower was a creamish-white *Compertialia*-like flower which we did not recognise. This house is laid out in a very pretty natural sort of style, with winding walks, rockeries, and ornamental pieces of water in which the plants present a very pretty appearance. Another house contained an immense number of *Coleuses*, in fact it was completely filled with them: it is not necessary to particularise any of these plants. There is also a small Orchid-house where the best flowering specimens included *Chysis bracteosa*, *Stanhopea Ruckeri*, *Brassavola nodosa*, several very good and well flowered specimens of *Brassia verrucosa*, and large numbers of *Oncotoglossum crispum*; some fine examples of *O. Pescatorei* and *O. Schleiperianum* may also be mentioned. One plant which was to be found in this house in good condition must not be omitted, although not an Orchid; it is *Lasiandra macrantha*, which is very attractive with its purple-red flowers, which, however, are too fugacious.

We must not omit to mention the Palm-house, which stands away from the foregoing houses, and containing several very fine plants, including *Draecena umbraculifera* and *Sabal Adansoni*, both very attractive; a fine *Lantana borbonica*, 20 feet high; and *Chamærops humilis*, 4 feet higher; and a specimen of *Scindapsus pertusus* also about 24 feet high. There were several other interesting plants, among which we might mention the official collection, placed in a cool structure connected with the Palm-house. There is an extensive nursery ground connected with the garden, and possessing great interest. The Dahlias were making a fine show here when we visited it, especially the single varieties.

In the centre of the garden, in a slight hollow, and directly in front of the Palm-house, is the Jardin Botanique, arranged according to the classification of the late M. A. Brongniart. This department is most interesting, and is very extensive, every order being largely represented. There are many interesting plants here, especially in the Conifère. Orchidaceæ are wonderfully well represented, and Cryptogams have great prominence. One botanic garden is very much like another as a matter of course, but at the same

time some are better than others—Rouen certainly has one of the best.

A capital institution in connection with the garden is a course of botanical lectures and botanising excursions to the neighbouring districts, under the able direction of M. Blanche. These lectures are open to all comers, and, more than that, the classes, which are held on Sunday mornings, are free of charge, so that any one who can spare the time may study botany and obtain specimens for examination for the mere asking for them. There is also a school of horticulture, where practical lessons are given during the proper season on the training of fruit trees of all kinds, the garden containing many excellent examples of well-trained trees.

The garden (exclusive of the botanical garden, directed by M. Blanche) and all the squares, &c., in Rouen, are now under the direction of M. Varenne, who deserves credit for the way in which he carries on the work connected with them all. We must also take this opportunity of expressing our thanks to M. Varenne for his courtesy and attention to us on our many visits to the delightful garden. *Le Voyageur.*

PLANT PORTRAITS.

BURCHELLIA CAFENSIS, *Revue Horticole*, September 16.—A very old stove plant, deserving more attention at the hands of our plantmen than it has yet received. We have no doubt it could be grown to be as fine an exhibition plant as an *Inora*.

CANTUA DEFENDENS, *Illustrierte Monatshefte*, October, 1886.

CYPRIPEDIUM PURPURATUM, *Revue de l'Horticulteur Belge*, September.

ECHINOCACTUS SENILIS, *Gartenflora*, t. 1230 A.

GEUM RHÆTICUM, *Butiger*, *Gartenflora*, t. 1229.

HYPERICUM OBLONGIFOLIUM, *Garden*, September 4.

LAHISIA ALATA, *Illustration Horticole*, t. 605. A Boineau shrub, belonging to the Myrsinaceæ. Leaves lanceolate, with a purple midrib, each about 6 inches long, by 3 inches in width.

FORESTRY.

RENOVATING OLD HARD-WOOD PLANTATIONS.

TIMBER for estates may now be felled, converted into boards, planks, &c., and set to dry, as has been previously recommended. Old plantations should be gone over, and dead branches and decrepit underwood, &c., should be cleared out. Where an open space is available all this may be burnt. The thinning and pruning of the trees should now be looked to. Where, as is now commonly the case in park woods, specimen trees of the newer and rarer Conifers are interspersed throughout, see that these have plenty of room for their perfect development.

If it be intended to plant up the newly thinned woodland with shrubs for covert purposes, the thinning should be somewhat severe, for as light and air are the essentials for the successful cultivation of underwood, the trees must stand well apart. Choose out the thinnest or most open spots for the various clumps of shrubs, keeping an eye at the same time to natural effect, particularly where the woods are contiguous to drives and walks; dig out pits 18 inches in diameter and 8 inches or so deep, at about 4 feet apart, the distance asunder depending of course on the size of the plants to be used, but for those of, say, 30 inches to 3 feet high the prescribed dimensions are near enough; take care that the sides and bottoms of the pits are well loosened with a pick. From a score to say fifty to sixty plants are sufficient in one clump, which should be irregularly arranged throughout the woods. Game of all kinds detest dense sunless jungles of underwood, but delight in the opposite. As regards the plants to be used fancy and use must decide, but the best suitable are the common and Portugal Laurels, Box, Privet, Yew, *Laurustinus*, various kinds of *Barberry* in the open situations only; while for single specimens to give a warm green appearance to deciduous woods in winter nothing equals the Holly, evergreen Oak, and Yew. The roots of the plants used for underwood should be well spread out, and

not planted any deeper, or at least very little more, than they were in the nursery borders. Pruning large tap-roots and ungainly top leading shoots should be set about either before the plants are sent from the nursery or immediately before being planted. In selecting sites for the large standard evergreens above referred to choose such as are open and airy and within a short distance of the plantation margin, as in such positions the furnished look of the wood, if composed of hard-wood trees, may be greatly augmented. For these bigger holes than those whose dimensions are above cited should be made, say, 4 feet in diameter and 18 inches deep, as for the future welfare of the plants a little extra expense must not be grudged. Stakes must be put to these as soon as planted, but on no account wait until a half-blown over, mutilated-rooted, and chafed-barked tree compels this being attended to. *A. D. Webster, Penrhyn Castle.*

GREEN DAHLIAS.

THESE productions, though by no means uncommon, seem to excite the attention of the public

FIG. 87.—THE GREEN DAHLIA, *D. VIREIDIFLORA*.

just now in no ordinary degree, on which account it may be appropriate to reproduce our illustration (see fig. 87). Immediately beneath the flower of an ordinary Dahlia are five or more small green leaves or bracts bent downwards; these are followed by a number of greenish scales, in the axils of which the true flowers, the quills or rays of the gardener, are produced. So that the Dahlia is not a single flower, but a "composite" of many flowers. In the green form the true flowers are not produced at all, but, as if by compensation, the green bracts are increased in number.

HIMALAYAN PRIMROSE SEED.

MANY packets of seed of Himalayan Primroses were distributed at the beginning of this year. Some of us are now being much puzzled how to make our seedlings fit the names which came on the packets. Excepting three or four weak kinds, such as *P. glabra*, *P. pusilla*, *P. sapphirina*, which came up late, and seem already to have made up their minds not to survive the winter, the main crop seems to be divided between *P. sikkimensis* and different forms of *P. capitata* (Hooker). I search in vain for any to answer to the leaf characters given in Hooker's *Indian Flora* for *P. reticulata*, *P. Kingii*, *P. bellidifolia*. The crop of *P. Elwesiana*, of which we had abundance of seed, seems to have failed universally,

all the seed having first mildewed, and then rotted. But time will show what the others are. One variety, however, has made such a rapid development here as to be worth recording. The packet was labelled—"(Mixed.) *P. capitata* (Hooker) and *P. bellidifolia* (King). Above Lachooing, at 13,000 feet." This was sown about the beginning of March, under glass, but without any artificial heat. It soon came up in great abundance. When pricked off the seedlings showed two very distinct varieties, each of them perfectly constant. One has long leaves, very mealy beneath, broadest at the end, and soon narrowing into a long winged stalk. The other, which has grown more than twice as fast, and of which nearly all are in bud, the first having opened a flower at the end of August, has the scape and umbel only mealy, and has broad flat oval leaves, with hardly any stalk. I feel no doubt that both are forms of that very variable species *P. capitata* (Hooker), though not one of the former variety shows a symptom of a bud. It is remarkable, however, if two varieties so distinct and so constant were found together, as the label seems to imply. I have often been struck by the vagaries of these polymorphic species. Some forms flower here early, some late. They are generally in flower in this garden from May to October. *C. Wolley Dod, Edge Hall, Malpas, Sept. 8.*

The Rosery.

ROSE SHOWS.

THE remarks of "Wild Rose" (see p. 296) on this subject deserve the serious attention, not only of all horticultural societies but of every individual rosarian. While most of the latter will agree with "Wild Rose" that Rose-showing has greatly increased the interest felt in the growth of Roses, yet not a few of us are inclined to think that Rose-showing manifests some dangerous tendencies towards forcing genuine Rose culture into seed; the fever heat of excitement thrown into Rose struggles for the mastery are perhaps as fatal to the wellbeing of rosarians as to their Rose blooms. Almost everything within the wide kingdom is also coming to be judged mainly or chiefly from the show point of view. This is a serious evil, for Rose showing should be looked at as a mere episode—a useful stimulus, it may be, in Rose culture—rather than the be-all and end-all of the same. The primary object of growing Roses should be the furnishing of the garden outside and under glass with their beauty and fragrance all the year round. Subordinate to this greater purpose, the more Rose shows in season the better.

But not only is Rose-showing responsible to a great extent for raising a wrong issue in Rose culture, but likewise for limiting the Rose season to the narrowest limits. It attempts to crowd its most perfect Roses into the month included between the last fortnight of June and the first of July.

It may be said that this is the natural season for perfect Roses in England. But art changes seasons in other plants, and the demand for good show Roses in August and September even, would doubtless bring forth a sufficient supply of perfect blooms to prove that autumnal Rose shows—which I have often advocated with a view of fostering continuous blooming Roses—are practicable and possible. Rose shows out of season is a field that the National Rose Society ought at once to enter and cultivate to the full. True, at first they might not prove popular, nor paying; but a National Rose Society on the right tack ought to be sufficiently strong and wealthy to be able to disregard either or both these considerations. On the ground of popularity of classes or prizes I would beg respectfully to differ from "Wild Rose." For example, the prizes for Roses grown within eight miles of Charing Cross, ought to be continued. If four or more compete, the Society is none the poorer; whereas, if one more attempts to grow Roses, stimulated thereto by the prizes offered, floricultural taste and practice is so much the further extended or improved. Experience has proved that it is possible to grow Roses—especially Teas—whose smooth leaves shoot off the London smuts almost in the heart of London; and the National Rose Society or others can hardly turn their resources to better account than by stimulating cultivators by liberal prizes to overmaster the obstacles of fogs and smuts in the cultivation of their Roses. It is only necessary to

attend an artisan Rose show in Nottingham to be convinced by the irresistible logic of facts, what perfection of Rose form, colour, finish, fragrance, are possible in a crowded town.

Neither can I quite agree with "Wild Rose" in recommending the omission of the prize for the baskets of Tea and Noisette Roses. What if some exhibitors mounted their sprays on wires, and others decorated the legs of their baskets with panning, fading Rose blooms. The basket form of massing Roses, in the hands of persons, controlled by cultured taste, is capable of yielding harvests of Rose grace and beauty, unapproachable by any other mode of showing. A few failures should not result in the abolition of basket showing, but in the withholding of the prizes offered until success is reached; thus gently compelling exhibitors to act up to the stimulating and wholesome spirit of the nursery rhyme, "If at first you don't succeed, try, try, try again." Assuredly, more awfully dreary things than some of those baskets of hybrid perpetuals shown—three or six dozen of A. K. Williams, flat as pancakes, in round hampers—could not be conceived; but undersized baskets, in which Rose sprays could be set in water, all such contrivances being hidden in green moss, consisting of buds in all stages of development, from small buds to three-quarter opened Roses, with abundance of foliage, ought to produce a richness and chasteness of floral effect such as single Dahlias, useful as they are, could never attain to. (See "Wild Rose's" third and fourth paragraphs.)

As to the prizes for the best six dozen Roses for amateurs, it may be useful in stimulating the latter and add novelties to their collections—a practice which experience is rather apt to check than foster. It may also have other uses. It is not always that what may be termed Trade Roses prove successful under amateur culture. New Roses that the latter can grow up to show standard may be said to be doubly certificated, and hence stand a better chance of selling freely after appearing in perfection in the stands of amateurs.

Most of the difficulties arising out of the best box prizes might be obviated by the sensible specification that only boxes of the same number should compete: thus, 72's against 72's, 30's against 30's, and 24's against 24's, &c. Such prizes, where they can be afforded, are useful in rewarding all-round merit in Rose growing—one of the most praiseworthy features in the products of some exhibitors, and sadly lacking in those of others. However fairly Roses are judged it would neither be fair nor possible to prevent a few extra good blooms from carrying almost undue weight in the awarding of the prizes; whereas in the best box prizes, the all over good Roses would stand a better chance of obtaining the prize. I quite agree with "Wild Rose" as to the difficulty, not to say absurdity, of putting a box of 24 against one of 72; though the plan recommended of dividing the number of points awarded to each box by the number of Roses it contained, is probably the fairest and soundest that could have been adopted.

Finally, the best Roses in the show prize should not be abolished, but extended. It often creates more interest than all the other prizes put together. But I quite agree with "Wild Rose" that two or more such prizes should be given. The phrase "two or more" is used advisedly, for ultimately a prize might be offered for the best Rose of each type of form recognised by the National Rose Society. But in all cases Teas, including Noisettes, should be separated for this prize from hybrid perpetuals; for though the difference may not be so great as that between horses, bullocks, and sheep, it is sufficiently wide to set any fair contrast or comparison between them at defiance. Besides, prejudices or predilections come in to complete the matter. No logic of reason or of fact will convince a lover of Tea Roses that any hybrid perpetual can compare with or come into the running with them for a best Rose prize. Hence the wisdom of letting at least these two classes only compete with their peers in the best Rose class.

Not a few rosarians think the time is at hand, if it has not already come, when Teas and Noisettes shall be excluded from the general collection, or that separate classes for hybrid perpetuals only should be established. Much as we love Tea Roses, agreeing with "Wild Rose" that they are emphatically the Roses of the future—that they must vastly increase, while the so-called perpetuals are doomed to decrease—yet it seems something akin to undue favouritism to give Teas no end of special classes all to themselves

at our great Rose tournaments, and then permit them to enter other classes ad libitum as well, and sweep off most of the cups and chief prizes. For it has almost passed into an axiom in Rose showing and judging, that the more and better the Teas in the mixed collections the more certainly shall they win 1st honours. Not, possibly, till a stand wholly of Teas shall sweep off all the chief honours will the practice, now so general, of allowing any number of Teas in the larger collections, be checked or regulated. The present mixed mode of exhibiting Roses for the larger prizes not only gives double honours and chances to the Teas—which they deserve—but introduces a distracting and disturbing element into the judging of the large collections. D. T. F.

ROSE W. F. BENNETT.

While I can scarcely go the length of saying that this is the best of Mr. H. Bennett's new Roses, I have no hesitation in stating that a great future is in store for it, and this opinion is heartily endorsed by Mr. Harry Turner. A number of pot plants at the Royal Nursery at Slough may be truthfully said to be laden with flowers; and it looks as if it would be a perpetual flowerer, for Mr. Turner states it does not make a shoot without producing a bloom at the end of it. It has colour and size of flower also to recommend it; it is described as deep velvety crimson, and it will no doubt take on this colour in the spring; now, owing no doubt to the drying winds, it was rather paler in tint. Its habit is undoubtedly vigorous, and this, added to its free blooming character, should lead to its being largely grown for forcing and cutting purposes. Mr. Turner sees that it will be in great request, and is working up a large stock of it in consequence. K. D.

PRESERVING FRUIT, FRUIT-JUICES, MUST, AND FRUIT WINE BY SALICYLIC ACID.

DR. F. VON HEYDEN's successor, manufacturer of salicylic acid at Kadeston, near Dresden, writes as follows:—

Fruit and fruit juices can be preserved in a variety of ways by means of salicylic acid, and which permits of being employed in all the various methods, jam making and preserving, &c.

1. Cherries, Currants, Raspberries, Green Gage Plums, common Plums (*Swetshagen*), Peaches, Apricots, &c., are placed in wide-mouthed glass bottles holding about 1 kilo. (2 lb. English), without water being added, putting alternately a layer of fruit and one of sugar. The upper layer must be of sugar. Above this last half a gramme (about half a teaspoonful) of dry crystallised salicylic acid is strewn. The bottles are then covered with parchment paper in the usual manner and placed in a water bath, and the water allowed to simmer for fifteen to thirty minutes, according to the size of the fruit—small fruit requiring less time than large; berries about thirteen minutes. When cool it is advantageous to cover with a piece of salicylic acid paper, and make fast. Fruits treated in this manner have and retain constantly the appearance of fresh fruit.

2. If it be desired to preserve large fruits, such as Quinces, Melons, Gourds, also Rose haws, in great earthen cooking vessels, put into the usual sugar and water syrup, half a gramme of salicylic acid per kilo. of fruit.

When filling the bottles a good fitting piece of salicylic acid paper, which must be saturated with a concentrated solution of salicylic acid and rum, must be laid on the surface.

3. When preserving Melons, Gherkins, Pears, Plums, &c., in vinegar, a little more than the proportion of salicylic acid given above can be added to the boiling vinegar and sugar, and the rum-paper can be omitted.

4. Russian rum compote.—The making of this is begun at the new year, and ends late in autumn, all sorts of fruit being placed in a large vessel as they come into season. The following is the process adopted in this kind of preserving:—Strawberries, for example, are placed in a layer, bestrewn with sugar, and a glass of rum is poured over the mass, and as this kind of compote easily ferments, half a gramme of salicylic acid per kilo. of fruit must be added each time anything is put in.

5. In making marmalade (must) and some other particular kinds of fruit, as well as the so-called

tutti frutti, the salicylic acid is added towards the end of the operation, and preferably in the form of the rum solution.

6. Freshly pressed fruit juices, with or without sugar, are preserved in excellent condition in a cool place in resin bottles, by the addition of half a gramme of salicylic acid to 1–2 kilo. of juice. Such kinds of fruit juices, free from alcohol, and not over-sweetened, make agreeable drinks, mixed with water, for children and convalescents. The raw juice of small fruits require in the warm season, when they are made, about 50 grammes per hectolitre put into the vessel when no spirits are added, so that fermentation be prevented. Complete exclusion of the air, and a cool storing place are absolutely necessary conditions of preservation in this case. Attention must be paid to the equal division and mixing; and if the acid be dissolved in spirits of wine, ten times the quantity of juice can be diluted, and then be well stirred about. In the wholesale manufacture, when a large addition of spirit is made with the intention of increasing the quantity, and therefore the use of salicylic acid does not appear to be necessary, the mass remains several days in the tubs before it is pressed, exposed to the risk of an injurious fermentation. This evil can be avoided, and the fine aroma preserved, by means of an addition of salicylic acid, dissolved in alcohol in the proportion of 5 to 10 grammes for every 50 kilos. of raw fruit as it is put into the vessel, or after the same is filled. By this means the juice will be more thoroughly and quicker clarified than by the usual method by means of spirit, because all kinds of fermenting organisms, owing to their absorption of the salicylic acid, remain inoperative.

7. Grape juice continues sweet and clear for a whole year, when 20 to 30 grammes of salicylic acid per hectolitre (= half a teaspoonful) per kilo. are mixed with some must into a sort of thin dough, free from lumps, and added to the unfermented must immediately after it has left the press. In fourteen days later the juice after becoming clear can be put into bottles. The latter must be washed out with a watery solution of the acid, and the corks should be boiled in the same.

8. Cyder and perry can be kept for long periods by the addition of 10 grammes per hectolitre. If the articles are preserved in casks, 5 grammes are given in the spring and 5 grammes in the summer. Complete exclusion of the air from the contents of the casks is essential, and by partial opening of the same the air should be passed through a cotton-wool plug saturated with salicylic acid, or, better, through prepared salicylic acid wadding.

Apples and pears remain in good condition and can be layered in large quantities when each fruit is wrapped in paper impregnated with salicylic acid. This last is readily made by soaking blotting or tissue paper in a mixture of alcohol and acid and hanging it over a string to dry. The complete purity of the acid is essential to success. *Deutsche Garten Zeitungs*, Sept. 22.

THE SEED TRADE.

FOREIGN GRASS SEEDS AND CLOVERS.—Advices are to hand from the principal seed-growing districts of Germany, and they are in the main favourable, as they indicate that more satisfactory crops of grass seeds are general than for some seasons past, and prices will in all probability range low for most of the leading kinds. The quality of the seeds also is above the average, and this can especially be said of *Dactylis glomerata*, *Festuca pratensis*, and most of the Poas—all of which show very fine and heavy samples. *Poa trivialis*, and especially *Poa nemoralis*, however, are scarce, the harvest of these being small. *Festuca duriscula* and *F. ovina* have yielded a fair crop, and the quality is generally satisfactory; and it is expected that prices will be lower than last season. *Festuca ovina tenellifolia* has been harvested in but small quantities, and it will no doubt be dear in price. The crop of *Cynosurus cristatus* has been harvested in fair quantities; the samples, however, do not exhibit such a fine colour as they did last season, in consequence of the continuous rains which fell during the time of harvest; but the growth of the seeds is reported to be quite satisfactory. *Anthoxanthum odoratum* has supplied but a quarter of an average crop, owing to having been affected by late frosts at a critical period of growth. The German crop of Timothy-grass is reported to be somewhat better than last year; in the United States of America it appears to have been harvested in smaller quantities than was anticipated, and prices have in consequence risen considerably above those which ruled at the close of last season. The prospects of the harvest of Clover seed is by no means a favourable one. The yield of Alsike, white Clover,

yellow Clover, and Sainfoin is but a very moderate one. Red Clover, not yet gathered early in September, did not promise beyond a moderate crop; and the same can be said of Lucerne.

THE HOME HARVEST.

As far as the home harvest prospects can be realised, the Irish crop of Rye-grass promises to be heavy, and samples satisfactory. English Red Clover there is every reason to believe will be a large crop; America it is expected will show the same result, and in all probability home prices will be cheaper than ever; Alsike is expected to be an average crop; while white Clover will be but a short yield. The late spring frosts and cold winds appear to have injured the plants in some way. A great quantity of peas; white Clover was held over, and as this is likely to prove of good germinating power, the scarcity of this season's crop is scarcely expected to affect prices very much.

English Tares are very low indeed in price, scarcely realizing more than 4s. per bushel. Ten years ago they fetched 14s. to 15s. per bushel. Kent Tares especially are very plentiful. It is supposed that the Kent farmers finding little sale for their green crops, set their Tare seeds much more largely than usual, with the result that there is something like a glut in the market. All round trade is reported to be greatly depressed, and travellers return home with spare orders, and these generally at prices that are scarcely remunerative. The great difficulty appears to be to sell at a profit. *Fisim.*

The Flower Garden.

THE BEDS.

In order to keep the flower garden gay as long as possible, as many of the larger leaves as can be conveniently spared would be better removed to secure a free circulation of air as well as to allow the sun's rays to mature the stems. The plants may now have their tops removed to a flower-bed. Edgings generally grow more freely now, and they will require looking to. Plants which are easily injured by frost may now be lifted from the beds. Pot them up at once, or lay them in pans and boxes, giving them a good soaking of water, and which will be sufficient for a long time.

CUTTINGS.

Keep all early struck cuttings free from decaying leaves, and scratch the surface of the soil occasionally to keep it the sweet.

RULES AND CORNS.

Crocuses, Snowdrops, Anemones, Narcissus, and Lilium candidum may now be planted. This is the most suitable time to move the latter. If shifted later on they sometimes remain dormant for a whole year, or if the bulbs get dried great injury is done. Snowdrops and Crocuses look well planted in designs on grass. They may be planted to denote names or coats-of-arms, or to represent animals, by drawing a design, with chalk and then following the outlines carefully with a dibber. If the bulbs be dropped into the holes, and a little sandy loam be put on the top to fill up, that is all that is necessary. A succession of flower may be secured if holes of various depths be made from 2 to 5 inches. Very pretty effects may also be secured by planting Crocuses and Snowdrops round shrub beds in three lines of various depths. This can be done by having a wire put through the dibber at the requisite depth. The Erythroniums, or Dog's-tooth Violet, should also be planted in abundance. These have a charming appearance with their mottled foliage and pink flowers.

VIOLAS.

Cuttings of Violas should be secured as soon as possible. The best places to strike them are under hand-lights or turf-pits; and a sunny situation will suit them best at this season of the year. Secure a hard bottom; on this place a couple of inches of half-decayed leaves, then from 2 to 3 inches of leaf-mould, loam, and sand, in equal quantities, passed through a ½-inch riddle. Select young growths from the roots. It does not signify how small they may be, they are certain to root, and are to be preferred to old flower-shoots which are hollow, as the latter do not root so freely, and never make such healthy stock. Put in cuttings in a similar situation, and under similar treat-

ment, of the various bedding Chrysanthemums. These will be in fine condition to plant out in the beds in the spring, and will produce better results than if struck and wintered in pots. Preparation will require to be made for the proper protection of bedding plants. In case of sharp frost, which may be looked for any night after rain, Pelargoniums which were struck in the open ground should be potted up at once, and placed under the protection of glass sashes. Do not use too rich a soil at this season of the year, so as to induce them to make large foliage. *Wm. M. Baillie, Luton Flower Garden.*

PLANTS AND THEIR CULTURE.

CHRYSANTHEMUMS.

THERE is no plant that gives so good a return during the duller parts of the year for all the attention bestowed on it as this. Tying in and giving a few more stakes where necessary must be regularly attended to; and the buds of most varieties should at once be thinned out, if large sized blooms are required. Choice should be made of the strongest and most prominent bud on each shoot; but it sometimes happens that this is a little deformed; and if left, the bloom would be of an irregular form, consequently the next best prominent one which is formed should be selected, leaving only one to each shoot. Now that the pots are well filled with roots, if they are not stood on a hard impervious bottom the roots will soon force their way through the bottom of the pots and get hold of the material on which they are placed, to prevent this they should be turned round at frequent intervals of a day or two, and being gross feeders they will require large quantities of manure-water to sustain them in a vigorous condition, particularly at this stage when they are throwing up their buds, and the soil in the pots is getting exhausted. Those plants which were layered some time ago will now be nicely rooted, and should be lifted and potted in small pots. Plants grown in the open ground during the summer, with the object of saving labour, will now be ready for lifting; and if a spade be inserted at a short distance from the stems about the size of the intended hole, four or six days before this operation takes place, it gives the plants time to recover from the check of cutting their roots, and by this means they suffer very little when potted. The plants must be stood in a cool, shady, and sheltered place, keeping them well syringed morning and afternoon, otherwise they will flag and lose part of their foliage.

PITS.

These structures are very useful for the accommodation of many plants, and it is found that a great many things do better in them than in houses, and require much less attention. The divisions which have just sufficient heat to keep out frost should be filled with early Primulas, late batches of which plants should have their final shift, keeping them up near to the glass, and affording them plenty of air. The early batch of Cinerarias and Cyclamen do well with the same treatment as the Primula. The remainder of the space in the pits may be filled with Solariums, Azaleas, Begonias, Pelonias, Mimoneites, Godolias, Roman Hyacinths, &c. The cold divisions can be filled with such things as herbaceous Calceolarias, which do much better in cold pits than anywhere else unless the temperature should be very low; late Cinerarias can also be kept in these cold pits for some time longer, admitting air freely on all favourable occasions, to prevent harm accruing from damp.

Keep a sharp look-out for slugs and caterpillars, as these cause great disfigurements. Tree Carnations should have a separate division if possible, and be plunged in coco-nut fibre, supplying them liberally with manure-water and giving full ventilation. I find the undermentioned sorts very useful:—White Swan, La Belle, Purity, La Hermine, Vestal, Sir E. Wood, Lady Seaton, Lady Emily, Fire King, Volunteer, Magnificent, Mrs. K-e-n, Laura, Sir George. *A. Evans, Lythe Hill, Haslemere.*

FRUITS UNDER GLASS.

VINERIES.

THERE is not much to be done in these other than maintaining a somewhat dry and airy atmosphere, and watering the inside borders two or three times in five weeks with clear water. This should be given in the morning, and if the weather should be dull at the time the fires should be started, so as to heat the water in the pipes sufficiently to prevent the condensation of moisture on the berries, and also to promote a buoyant internal atmosphere. Look the bunches over

once or twice a week, and remove any decayed berries that may be in them. Also remove house spiders, which should have no quarters in vinerias in which clean Grapes having a good bloom are aimed at. Here many of the late varieties of Grapes are not yet quite coloured; these include Gros Guillaume, the large 8 or 10 lb. bunches being more backward in this respect, and Gros Colmar; but the foliage being good, there is ample time to lay on a good colour and bloom between this and the date of the Vines shedding their leaves. Therefore a somewhat warm, dry, and airy atmosphere will be maintained; allowing a free circulation of fresh air during bright sunny weather. The laterals of Vines from which the bunches have been cut should be shortened back a little, so as to admit more light among the shoots, that the wood may become thoroughly ripened before the Vines shed their leaves.

MELONS.

Plants growing in frames placed upon hotbeds will require to have the linings made up round them with fermenting material, such as long stable-dung or short grass, so as to impart sufficient heat to the interior of the bed and frame, to prevent the night temperature from falling much below 65° until the crop is secured. And with this object in view, withhold the syringe from the plants; also abstain from giving water to the roots, as the latter can absorb all that is necessary for the ripening of the crop from the manure-heap on which they are growing. Cover the frames at night with mats.

VINES AND VINERIES.

Vines from which ripe Grapes are required at the end of April or early in May next should now be pruned back to a good plump bud as close to the main stem as it can be obtained, taking care that the half-inch of wood left beyond the bud is not split in doing so. The wounds should afterwards be dressed with "Thomson's Syptic" to prevent "bleeding." The house must be thoroughly cleaned in all parts with soap and warm water, the woodwork with clean water only, and the brickwork and plaster washed over with hot lime. The rods of the Vines should then have the loose bark that may be on them rubbed off with the hand, and afterwards be well washed with a well mixed solution consisting of about 4 oz. of Gishurst Compound, the same quantity of sulphur, and 2 oz. of soft soap dissolved in a gallon of warm water. This should be well rubbed into the Vines with a stiff brush, especially into the crevices about the spurs, so as to destroy red-spider or other insects that may be in hiding there. Care must be taken not to injure the buds in this operation. After the Vines are cleaned, the rods should be tied horizontally to the wires at the front part of the house until they begin to break, when they are trained up in the usual way, care being taken to cause no injury to the buds in doing so.

The surface of the border should be pricked over with a steel fork, without injuring the roots, which if in a satisfactory condition will be a perfect network a few inches beneath the surface. Then remove the loose soil and lay on a good dressing of Thomson's Vine Manure, working it into the soil with the fork, and follow this with soil, consisting of three parts loam and one of lime rubble as a top-dressing, 2 inches in thickness, followed by a mulch of a like thickness of horse-droppings. Then a good soaking of tepid water should be applied, which with subsequent applications will wash the substance of the manure down to the roots. If the border be an outside one rotten dung might be substituted for horse-droppings, and over this a bed of 20 inches in the absence of leaves and fermenting manure (about one part of the latter to three of the former), well mixed, should be laid. This by heating the surface of the border will have the effect of attracting the roots thither, and in the top-dressing and mulching they will help to induce a network of rootlets. The bed of dung and leaves should, according to circumstances, be freshened up two or three times during the interval from the middle of November to the middle of February. As soon as the internal arrangements have been completed the ventilators should be kept closed at night, and the process of forcing be commenced in the second or third week in November by applying sufficient fire-heat to maintain a night temperature of 50°, and 55° to 60° by day, raising up to 10° higher with sun-heat. Syringe the Vines with tepid water two or three times a day, more or less frequently according to circumstances. *H. W. Ward, Longford Castle.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Oct. 4	Sale of Dutch Bulbs at Stevens' Rooms
		Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
TUESDAY,	Oct. 5	Clearance Sale of Nursery Stock at Cranston's Nursery, Hereford, by Frotheroe & Morris (ten days)
		Sale of Nursery Stock and Greenhouse Plants at the Nursery, Upper Loding
		Crystal Palace Autumn Fruit Show (four days)
WEDNESDAY,	Oct. 6	Sale of Plants and Bulbs, at Frotheroe & Morris' Rooms
		Clearance Sale, Named Indian Azaleas, Camellias, Gardenias, Dutch Bulbs, &c., at Stevens' Rooms
THURSDAY,	Oct. 7	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
FRIDAY,	Oct. 8	Sale of Imported Orchids, at Frotheroe & Morris' Rooms
SATURDAY,	Oct. 9	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
		Sale of Dutch Bulbs, at Stevens' Rooms

IN continuation of our remarks on the PRICES OF GARDEN PRODUCE in our issue of September 18, p. 368, we may remark, respecting the CUT FLOWER TRADE, in which so many are now engaged, that it generally happens that there are a few odd kinds, sometimes of one thing and sometimes of another, that are scarce, and consequently fetch fair prices; but the deficiencies that occur in this way are accidental, as it usually happens that when there has been for a time an insufficient supply of any particular flower, the next season it is so much overdone as to be all but unsaleable.

It is scarcely necessary to say that the growers of outdoor flowers in this country, except in the case of the commonest kinds—which never fetch much—are virtually forestalled by the foreign growers, whose climate enables them to be always first in the market. Aided by cheap labour, cheap land, a cloudless sky, and an absence of changeable weather, which the home grower has to battle with, the foreigner is in a position to make light of the one disadvantage he labours under—cost of carriage, the extremely low rates of which for things brought here do not seriously affect him. Neither is it the home growers of outdoor flowers alone who suffer from the influx of foreign produce; the best kinds grown here under glass often do not fetch a third of the price they should and would do were the foreigners absent. The Hyacinth and Daffodil flowers, that come over by the ton in spring, are a case in point; for several weeks each season these are now so plentiful as to bring down to zero the prices of the tender indoor flowers which the home growers have to offer.

With pot plants of nearly all kinds, the same lowness of price prevails. During the last two or three seasons hundreds of thousands of Hyacinths and other bulbs have been sold at prices so little above what was paid to the Continental growers for them as to barely be enough to cover the cost of fuel, pots, and labour, leaving nothing for profit or interest on the capital invested in the houses required to grow them, and which, by the way, is money sunk in stock of the most perishable nature. What has been said respecting Hyacinths and other bulbs holds good with far the greater portion of the different sorts of plants which are cultivated in pots for market. Pelargoniums, which for so long held the leading place amongst flowering plants, have become of so little value that some of the growers who have been the most successful with them have within the last year or two given them up, and taken to things that take less time. Such things as Cinerarias, Primulas, and Fuchsias now often do not fetch more than 3s. per dozen—a price about which it is not necessary to speak further than in remarking that, if the principles of trade unionism existed amongst the hands engaged in growing them either as regards the speed at which the work has to be got through, or the length of hours the workers have to keep at it, the price would not pay for the labour, leaving everything else out of the reckoning.

Those unacquainted with the subject, or who

take a selfish view of it, and jump to the conclusion that if things of all kinds are only cheap enough all is right, regardless of who suffers in the struggle to produce them, may be disposed to offer to the market growers the advice that JUPITER vouchsafed to the waggoner, namely, that they should "put their shoulder to the wheel." This they have done, and continue to do, but it is terribly uphill work when they have not only to fight against over-production at home, but, in addition, have to contend with

will give an idea of the size and stately aspect of this plant, a near relative of the lowly Lords and Ladies of our hedges. The stem or rather the leaf-stalk forms a stout shaft of a green colour mottled with white or yellowish spots, and bearing at the summit a huge leaf-blade, divided primarily into three main branches, and subsequently into a mass of smaller ones, the ultimate subdivisions being ovate-lanceolate. The spathe is thrown up from the tuber at a different period from the leaf, and has not as yet been produced at Kew. One huge leaf here does the work of many.

FIG. 88.—*AMORPHOPHALLUS TITANUM*.

foreign competition in the struggle in which they are unequally handicapped.

— *AMORPHOPHALLUS TITANUM*.—Some time ago Signor BECARI forwarded us an account of the most gigantic of Aroids yet known, and discovered by him in Sumatra. Referring to the account in vol. x., 1878, pp. 596, 788, under the name of *Conophallus Titanum*, for the full details of this very remarkable plant, we now place before the reader an illustration, by Mr. ALLEN, of a specimen growing in the Victoria-house in the centre of the T-range at Kew, and which has been a striking object in the house for a long time past. This and our other illustration (figs. 88 and 89)

— RICHMOND.—We are pleased to hear that the Vestry has been empowered to purchase the Duke of BRICCLEBUCH's estate, with the view of converting it into a public garden. There was a feeling of dread lest the speculative builder might get hold of the property, and so deface the most lovely view of the kind that England has to show. Thanks to the public spirit of the Richmond people, this gigantic piece of vandalism has been averted, and the many attractions of Richmond will be enhanced rather than defaced. Well done, Richmond!

— SEMI-DOUBLE FLOWER OF *ODONTOGLOSSUM WILCKEANUM*.—Mr. JAMES sends us a flower of this species, projecting from the column of which, on

FIG. 89.—A GIANT AROID AT KEW, AMORPHOPHALLUS TITANUM. (SEE P. 432.)

either side, is a small petal, exactly like the true side-petals, but smaller. There is little doubt that these supplementary petals represent two of the outer rows of stamens which an Orchid has *in posse*, and sometimes *in esse*. According to the Darwinian scheme of notation, this flower then has the stamens A 1 perfect, A 2, A 3, petaloid, while the remaining three, a 1, a 2, a 3, are absent.

— **CAUCASUS BOXWOOD.**—Vice-Consul GARDNER reporting from Potti, says that the Boxwood forests in the vicinity of Potti are exhausted, and supplies are now drawn from Abkassia, which province has lately been opened to cutters by the Russian Government. About 2000 tons were cut and exported during the year 1885 to the United Kingdom. This wood is of fine clean growth, good colour, and great thickness, many pieces being 15 inches in diameter.

— **THE RIPENING OF GRAPE.**—The first rudiments of the flower, like those of a Rhododendron, are always produced in the autumn previous to the expansion of the flowers. The lowest buds appear first. Upon the general vigour of the Vine, and more particularly of the bud itself, depend the abundance and condition of the flower. Sometimes the absence or the enfeebled condition of the bud is dependent upon the weak state of the nearest leaf. M. MULLER, from whom we quote, says the leaf to which the bud is axillary; but this is a slip; the flower-buds of a Vine are not axillary, but opposite to the leaf. The flower-bud once formed grows very slowly in autumn, and not at all in winter. Growth recommences in spring, and is more active then even than in autumn, when there is a higher temperature. Self fertilisation is preferred by M. MULLER to cross-fertilisation, as affording better and more certain results. The swelling of the berries is facilitated by nitrogenous manures—an indication for the use of liquid manure after the berries have set.

— **ADIANTUM CUNEATUM ELEGANS** (see *Gardeners' Chronicle*, p. 134, August 1, 1885).—Mr. C. KERSHAW, of Brighthelm, sends us plants of this variety of Adiantum, described in our columns last year in the number for August 1, and there spoken of approvingly. It still retains the elegant character which suggested the name, and we observe from the plants now before us that it is particularly dwarf and compact in habit, and therefore capable of being kept in a state fit for furnishing and decorating purposes for a long time with little trouble. When we say that it is pleasing and graceful in appearance, we only say what is true of the type form and of most other species of this genus. The remark is quite true of this variety, but besides it has the dense stony habit above alluded to as an additional recommendation. Mr. KERSHAW informs us that it is a very hardy variety, and that the plants produce an enormous quantity of fronds, of which, indeed, the examples before us bear full evidence.

— **GRAPE SEEDS.**—Microscopical examination shows that these seeds have on the outside a layer of cells filled with hard woody matter; this is the protective layer. Beneath it is a layer of cells, which have the faculty of absorbing and retaining a large quantity of water, and this overlies a layer of cells containing tannin. The substance of the seed (the perisperm) contains much fatty matter, albumen, and aleurone.

— **NEW COMMERCIAL BOTANY CLASS AT THE LIVERPOOL UNIVERSITY.**—There is now, says the *Chemist and Druggist*, every probability that with the commencement of the autumn term a commercial botany class will be formed, having as its teacher, Mr. R. J. HARVEY GIBSON, M.A., F.R.S.E., who is at present demonstrator of biology in the college. The aim of the class will be to impart a sound knowledge of the nature and the methods of preparation of the principal commercial products of the world which owe their origin directly or indirectly to the vegetable kingdom. The subjects will be discussed under five heads—viz., food material, drugs, clothing, &c., architecture and general purposes. In regard to the second of these, it is announced that "the characters of the plants employed, and the mode of extraction of the active principles and oils, &c., will be the points more especially dealt with." Of the fifth subject—"general purposes"—it is said that the section "will embrace a discussion of such products as gums, dyes, &c., not conveniently classifiable

under any of the other headings." The classes will be held in the evening, and the fees are to be based on a low scale, with the view of securing the attendance of those persons who are most interested in the different subjects, to whom ordinary fees might present a difficulty.

— **CANADIAN NEWS.**—The first steamer with Canadian fruit for the Colonial Exhibition sailed for London on September 24, and the second was to sail on September 30. The fruit has been carefully selected, and of only such a degree of ripeness that it will be in good eating condition at the time of arrival. The steamers are fitted out with specially constructed refrigerators. —The Canadian correspondent of the *Liverpool Journal of Commerce* says that the report prepared for the Canadian Grand Trunk Railway Company of the crops in the section of the Dominion traversed by that line is generally of a very encouraging kind. The yield of fruit alone is expected to be poor, and only in some localities. On the main lines between Toronto and Montreal the yield of Wheat is estimated at 15 to 20 bushels per acre west of Morrisburg, and 20 to 25 bushels east of that town. Barley is a magnificent crop, averaging about 30 bushels. Root crops west of Belleville are good, but eastward Potatoes are, to some extent, rotting. The hay crop is variable, but good in most places. On the Midland main line Wheat will average 20 to 25 bushels per acre, and Oats 30 to 35 bushels. In the section covered by the Cobocock branch Wheat averages 20 to 30 bushels, Barley 30 to 35 bushels, and Oats 40 bushels. Roots are good and fruit fair. The quantity of grain to be "shipped" during the present season from this part of the country will be 30 per cent. more than that of last year, and on other portions of the line 20 per cent. more.

— **NATIONAL CHRYSANTHEMUM SOCIETY.**—A general meeting of this Society will be held on Monday, the 11th inst., at 7 o'clock, P.M. at the "Old Four Seasons," 84, Bishopsgate Street, City, when E. SANDERSON, Esq., President, will occupy the chair.

— **THE BOTANICAL EXCHANGE CLUB.**—We have received a copy of the report for 1885, which gives some notion of the doings of a small but devoted band of British botanists. Among other things, we note that one contributor has collected a series of varieties of the common Shepherd's Purse, *Capella bursa pastoris*. This practice is likely to be of great value in enabling us to estimate the limits of variation in any one species, and in ascertaining the lines in which natural selection might possibly operate. We hope Mr. MOTT's specimens are accompanied by notes as to the circumstances and conditions under which the varieties grew. The importance of such observations in ascertaining what characters are of physiological and adaptive nature, and what of more direct genetic significance, can hardly be overestimated, and they would add special interest to the mere discrimination of forms, separated by very slight or by inconstant barriers.

— **EDWARDS' DESICCATED SOUP.**—Messrs. F. KING & CO. (Limited) forwarded us a sample of their soup for trial. The packet contained 1 oz. of the dry material, and made three-quarters of a pint of good soup, being very nicely flavoured with vegetables. It would be very handy in a house where soup might be wanted in a few minutes, and it is inexpensive, the sample we tried being a pennyworth.

— **ORIGIN OF THE BLOOD ORANGE.**—A correspondent sends us the following cutting from the *Tropical Agriculturist* respecting the origin of the Blood Orange, in the hope that its appearance in our columns may lead to a discussion tending to confirm or refute the ideas suggested in it:—

"The Blood Orange.—Another very curious and popular Orange is the Blood. The general appearance of the tree, leaf, and flower, differs only from other Orange trees in the absence of thorns. Its fruit is distinguished by a colour of blood which develops itself gradually as the fruit begins to ripen. Little by little the blood-coloured spots appear in its pulp; as it advances to maturity these enlarge, becoming a deeper blood colour, finally embracing all the pulp, and spreading to the skin, which becomes a brighter blood colour, the longer it is allowed to hang on the tree. This variety

of Orange has provoked much discussion, and many theories have been advanced as to its origin, some claiming it was produced by grafting the Orange into the Pomegranate tree; others that it was simply a freak of Nature. From conversation with Mr. ROSE, manager of the New York Fruit Exchange, who spent twelve years of Orange culture on the island of Sicily; and from Mr. G. AMBROSIO, one of the most experienced growers in Sicily; and other Orange importers and growers, I am positively assured that the Blood Orange is as distinct a variety as is the Baldwin Apple from the Greening, and as a graft from a Baldwin Apple tree upon a Greening tree will produce a red Baldwin Apple, so the product of a bud or graft from the Blood Orange tree, when grafted or budded into any other variety, will surely be a Blood Orange, thus proving beyond a doubt that the Blood Orange is not a freak of Nature, but a distinct and separate variety, produced by hybridising the Orange with the Pomegranate. (1) In the start the Blood Orange is grafted from the Orange to the Pomegranate tree, and in two years time is again grafted from the Pomegranate to the Orange, so as to secure a regular supply of bloods which otherwise would soon die out, the Pomegranate being short-lived. I have given this species special attention owing to the various opinions—purely guess-work or theory—expressed both upon the street, among the fruit trade, and in the newspaper columns; for that reason I have interviewed the above-named gentlemen, whose opinions I accept and present by permission as indisputable authority."

Of course no gardener would admit the preposterous notion that a Pomegranate would either graft or hybridise with an Orange.

— **APPLE BISMARK.**—We noticed at Stanstead Park Nursery, Forest Hill, this new Apple, of which great quantities are grown, fruiting well in pots, and in the open ground. It appears to be very prolific, and to take after the Nonsuch, but more highly coloured.

— **EUSTOMA EXALTATUM.**—This is the *Lisianthus exaltatus* of LAMARCK, or the *L. glaucifolius* of JACQUIN, and is inferior in size and showiness to that of the more landed *L. Russellianus*, which flowered some time ago in Kew and had the same erect, rather stiff habit, with the shoots terminated by a huge solitary flower. The plant under notice, however, is altogether smaller and comparable in habit to our native *Blackstonia (Chloris) perfoliata*, with blue flowers, however, instead of yellow. The flowers being all produced at the apex of the branches, give the upper part of the plant a naked and somewhat leggy appearance, a fault noticed by other observers. The cordate or ovate leaves are opposite, and together with the stems have the same glaucous appearance as *Blackstonia*. The corolla is of a tint approaching to the blue colour seen in *Excacum affine*, and is accordingly much less intense than that of *E. macranthum*, one of the best of all *Genianthos*. Both the latter have been in excellent condition for many weeks in the Begonia stove at Kew, and are likely to be so for weeks to come. *Eustoma exaltatum* is figured in the *Botanical Register*, 31, 13, and occurs wild in many parts of North America, Mexico, Cuba, and St. Domingo. It is the practice to grow the plant as a biennial from seed, but if cuttings were taken off early enough the plant might be perpetuated in that manner just as many other *Genianthos* are treated, which are otherwise often difficult to procure from home-raised seed. Sandy peat has been found a good medium in which to grow it, watering freely when fairly into growth.

— **GARDENING APPOINTMENTS.**—Mr. WALTER VINCENT, late Head Gardener to HOWARD GILLIAT, Esq., Cecil Lodge, Abbots Langley, Herts, has been appointed Head Gardener to THOMAS DEYAN, Esq., Stone Park, Dartford, Kent.—Mr. JOHN WILKES, late Gardener to GEORGE MEAKIN, Esq., The Hayes, Stone, Staffordshire, has been appointed Gardener at Creswell Hall, Stafford, Mr. MEAKIN's present residence. Mr. JOHN BATES, late Foreman under Mr. WILKES, to be Head Gardener at The Hayes, Stone.—Mr. WILLIAM FRY, Foreman at Lower Castle, Penrith, has been appointed Head Gardener to L. C. SALKELD, Esq., Holme Hill, Dalton.—Mr. R. WOODWARD, late of Woodbridge Park, Guildford, Surrey, has been appointed Gardener to H. MICKLEM, Esq., Rose Hill, Henley-on-Thames, Oxon.—Mr. C. W. BAYNES, late Gardener to General MCMURDOCK, Rosebank, Fulham, as Gardener to D. WALKER, Esq., Wolverton, Beckenham.

SCOTCH NOTES.

THE INTERNATIONAL EXHIBITION,
EDINBURGH.

THE continuous horticultural display has been well kept up by Messrs. Dickson & Co. of Edinburgh; Cocker & Sons, Aberdeen; Dobbie & Co., Rothsay; Campbell, High Dalnyre, Glasgow; Lamont & Son, Edinburgh; and D. MacDaniel, Boskoop, Holland. The last-named exhibitor put up a limited selection of Apples and Pears and Dutch bulbs; Williams' Bon Chrétien, Durandeau de Tongres, Beurre Merode, and Beurré Goubalt were the best and most striking amongst the Pears; and Dantziger Kaut Apfel, a large handsome dessert sort, was the most notable of the Apples.

Messrs. Lamont & Son, in addition to their attractive display of single and Cactus Dahlias, have had a very fine exhibit of choice Gladioli, Phloxes, and other florists' flowers. Mr. Campbell maintains daily the superior quality of his Dahlias, Hollyhocks, Pansies, Carnations, and Picotees. Messrs. Dobbie & Co., in addition to the specialties recorded in a former note, set up magnificent samples of their selected Parsnip, Leek, Blood-red Onion, and Parsley. These are all very good in their way—scarcely a fault or blemish to be found about any of them. The Onion and the Parsley may be described as specially excellent. Messrs. Cocker & Sons were most attractive with their massive bank of Rose blooms, chastely relieved by elegant small Palms, such as Kentias and Cocos, and Maidenhair and other Ferns in pots. Amongst their collection of hardy herbaceous plants very fine spikes of *Lobelia Tupa*, a Chilean species not usually accounted hardy in the North, were seen from time to time. Messrs. Cocker find this distinct and remarkably handsome plant perfectly hardy with them.

Messrs. Dickson & Co.'s collection of Apples formed a point of very considerable interest to the general public. Upwards of 150 varieties were exhibited, all of which were grown in the open quarters of the firm's nursery at Liberton, near Edinburgh. The aspect is a north-west one and rather exposed, certainly not the most favourable conditions for successful Apple cultivation. Here Messrs. Dickson & Co. have laid out a stock ground with about 300 varieties of Apples procured from many sources with the view of testing the fitness of each for cultivation in Scotland. That the test is a severe and conclusive one is clearly shown in the collection put up in the exhibition during the last fortnight. Many sorts well known in the more favoured parts of England are to be seen in the collection in the most forbidding condition—small, hard, green, and so palpably sour that the most reckless urchin would pass them by without regret. Some of these would, no doubt, do well in Scotland on walls with a good warm aspect, but the object of the experiment was to test and make known to the public those varieties that might be relied upon for good cropping and marketable qualities when planted in the orchard as standards or in pyramid and bush form in the kitchen garden. Comparatively few of the 150 sorts exhibited appear to stand this test satisfactorily. The following are some of the best as noted from the collection:—

Keswick Cod in (St. George).—A variety of Codlin from Nottinghamshire strongly resembling the Manx Codlin, but the fruit is larger and the tree is said to be a more healthy and vigorous grower. Duchess of Oldenburg: fruit a good size, but later and not so well coloured as it usually is in the South. Ecklinville: fine fruit and one of the most reliable in any situation. Hawthornden, both the new and the old variety, were fine fruit, but somewhat spotted. Golden Noble, though smaller than it is usually seen in the South, was yet of good size, clean and attractive. Professor, a seedling from Royal Codlin, raised by Messrs. Dickson & Co., is a very superior looking early kitchen Apple. Greenup's Pippin has rather a strong resemblance to Yorkshire Beauty, but appears to be a later variety. Lord Sutherland: this was in splendid size and form, and some branches exhibited with the fruit attached showed admirably its enormous cropping qualities. Royal Codlin: very fine. Messrs. Dickson consider this the best of the Codlins for Scotland, and always recommend it when referred to by customers for advice; Stirling Castle very good; Pott's Seedling, fine, but not up to the standard of size and quality it attains in better

situations. Cellini, very good, but not so large as in the South; Messrs. Dickson look upon this as a very desirable sort for Scotland, though it is somewhat liable to canker where the subsoil is cold and ungenial. Worcester Pearmain, very fair in quality, but rather undersized, compared with southern samples, and lacking the high colour characteristic of the sort, though this was ascribed to the cold sunless season. Warner's King, splendid as to size and quality; King of Pippins, very fine, and at Liberton an abundant bearer; Oslin Pippin, comparatively small, but of choice quality, bears fairly well in the open ground, but would, no doubt, be much better from wall trees on which it is usually grown in Scotland; Grenadier, handsome, and of good size; Messrs. Dicksons say this promises to be one of the very best. Early Julien does well evidently at Liberton, the samples being good; Ringer, good samples, said to bear profusely at Liberton; Brown's Summer Beauty, a very attractive medium-sized Apple, said to bear well; Small's Admirable, a handsome Apple of good size; Summer Strawberry, very pretty and attractive, and said to be very prolific. Robert Black: this is given as a provisional name to one of the most notable Apples in the collection. Its history is not known to Messrs. Dickson, and though samples have been submitted to leading authorities they have failed to identify it. It is a beautiful early yellow Apple, of considerable size and handsome shape, and is said to be a free bearer. Jacques Lebel, a large handsome fruit, and said to be a valuable late sort; Lord Grosvenor, very good samples, and the sort is regarded as a promising one for extended cultivation in Scotland; Irish Peach, fair samples—this is regarded as by far the best early dessert Apple for Scotland; Court of Wick, small as compared with southern samples, yet good and desirable; Dredge's Fame, of medium size, but handsome, and said to be a good and reliable bearer.

It is not implied that the foregoing selection comprises all that were worthy of being noted in the collection, they are merely the more notable of those that do well in the severe conditions under which they have been tested. There were many others that were above ordinary merit, and many which in more favoured localities in Scotland, are known to be of first-rate quality and altogether desirable. X.

THE FERNS OF THE ALPS.

We have in the chain of the Alps a certain number of interesting Ferns whose culture would not be attended with any difficulty, especially in a damp climate like that of England. I have for the most part raised them from spores in the Jardin Alpin d'Acclimatation. These Ferns may be, from a cultural point of view, divided into two sections—the purely terrestrial species, which grow in and cover the soil of the forests and coppices, and the rock species which belong to the rocky regions. The first group is met with more particularly in the wooded or mountainous regions; the second in the higher zones. Terrestrial species are, however, found in the high regions and *vice versa*.

Botrychium virginianum, Eastern Switzerland, Bavaria, Tyrol; *B. simplex*, Engelberg; *B. rotundifolium*, Bormio, Chamoniaix; *B. lanceolatum*, in the Upper Engadine, near Pontresina (Boissier's herbarium, in a manuscript note of Milde); and lastly, *B. Lunaria*, common in all the high regions of the alpine chain, are six perfectly distinct species of one genus, all very interesting, and of easy cultivation. They are essentially terrestrial, requiring a deep, rather light soil, slightly peaty, and moist. They all prefer sun to shade, but do not like to be too dry. In order to have them as fine plants they must be planted rather deeply in ground covered with turf and rich in humus. The most beautiful of these species, to my mind, is *B. rotundifolium*, the rarest *B. lanceolatum*, which I have not yet cultivated like the rest. *B. Lunaria* is the commonest of all, and is also the most easy to raise. It is quite a simple matter to grow it from spores. I have found it on the summit of the Pointe du Plan, in Savoy—large forms, of a height of 9 inches, more or less.

Orthocentrum Marantæ (*Gymnogramma Marantæ*) is not, strictly speaking, an alpine species; it grows on walls in the low regions of Tessin, in Valceline, and in the valleys of Aosta: it is essentially a rock-loving species, and requires a warm and moist situation. Its foliage is stiff, but at the same time elegant, and the fronds are of a red-brown colour beneath.

It is one of the most interesting Ferns of Northern Italy.

Alchemilla crispus (*Cryptogramma crispus*) of the high granitic Alps at an altitude of from 6500 to 8000 feet. This charming little Fern is met with on the stones of the Alps, which it envelopes by its presence when all around it is dead and withered. Only this summer I have seen it but a few steps from the Hotel Weisshorn-Anniviers, in the rubbish of granitic rocks which possessed no other vegetable life than it except lichens. It is one of the prettiest alpine Ferns; it has, like *Osmundas* and *Ophioglossum*, both fertile and sterile fronds. The sterile fronds spread themselves on the ground, and are wonderfully graceful, while the fertile fronds are stiff, and stand erect in the centre of the others above which they project. It is a purely rock plant, and a granite-loving one. Under cultivation it assumes a much finer appearance when it is planted deeply in the *débris* of crystalline rocks; it also likes a sunny exposure.

Blechnum spicatum is found chiefly in the woody and mountainous region. Its leafage is stiff, of a sombre and glossy green colour, and it is very decorative, at least, as far as its sterile fronds are concerned. As to the fertile ones they are stiff, not very graceful, and much narrower. This is a terrestrial plant, liking shade, a light soil, rich in humus, and rather more dry than wet.

Asplenium septentrionale, Holm., is a plant belonging to the granitic rocks and erratic boulders. It is a native of the sub-alpine zone, and will hardly grow at a greater elevation than 5000 feet, but, all the same, it is sometimes found in the plains attached to erratic boulders. It has been maintained on these rocks (which are sometimes met with at enormous distances from the place where the *Asplenium* grows) since the time when they were transported, perhaps by glaciers, or by landslips from the heights down to the lower levels, or, has it been introduced by means of its spores, which certainly float about in the air to great distances? It is a question. A very interesting fact has just been made known at a meeting of the "Société Helvétique des Sciences Naturelles," by Professor Förel, of Morges. The learned Professor has been exploring, for several years, the waters of the Lake of Geneva; he has even made a very curious map of the depths of our lake. When sounding at Yvoire, the Professor got from the bottom of the lake, at a depth of about 500 feet, on a glacial moraine beneath the surface of the lake, some little calcareous pebbles on which he has demonstrated the presence of mosses. Moss at this depth seemed to him to be extraordinary, and he had the species determined by Professor Schuetzler, of Lucerne, who has referred it to Thammium Alpeorum of Schimper, a terrestrial species growing on damp rocks. This species was probably fixed on the rocks at the time of the glacial period and was held fast and maintained there during their breaking up and melting. It has remained at the bottom of the lake, and, little by little, has habituated itself to its new conditions; there it has sustained itself, probably reproducing itself by spores, although as yet there is no proof of that, and it has produced the form called by Schuetzler *Bocion*. This determination has been confirmed by the celebrated bryologist, Limpricht, of Breslau. It need not, then, astonish us that *A. septentrionale*, which decorates the erratic boulders of our plains, should have accompanied the *débris* of the granitic mountains in their course, and have been able to exist on them up to the present time. How can we otherwise explain the fact that *A. septentrionale* is found on the erratic boulders of the Jura, a district essentially of limestone, especially when it is known how far apart are these two chains of mountains? This species is very characteristic; its fronds are elongated, slender, linear, having only from two to four segments, sometimes incised at the summit; it is decidedly rock loving, and likes the sun. It succeeds admirably in the chinks of walls.

A. viride appears to be merely an alpine form of *A. trichomanes*. *A. viride* is, however, a distinct and real species, distinctly characterised by the green colour of its rachis, by its herbaceous habit, not winged, its segments having short petioles and more deeply crenate than *A. trichomanes*; it likes shade and moisture, and a limestone soil mixed with a quantity of humus.

A. germanicum (*A. Breynii*).—The Alps of Eastern Switzerland and of Tyrol. Some botanists think

that *A. germanicum* is only a hybrid between *A. trichomanes* and *A. septentrionale*. I ought to acknowledge that, until the contrary is proved, I am inclined to that idea, for I have never seen *A. germanicum* in fructification, and I have not had the opportunity of growing it. If any of my readers could send me any information on this subject it would be received with many thanks. *A. germanicum* is nearly always found in company with *A. trichomanes* and *A. septentrionale*, and in granitic rocks. Its cultivation is the same as that of *A. septentrionale*.

A. fontanum (*A. Halleri* var. *pedicularifolium*).—Eastern and Southern Switzerland, Tyrol, in limestone rocks, Jura, and Salève, near Geneva. A very pretty species, with finely and delicately cut fronds. The plant should be grown in the shade, in a stony soil, or in the chinks of old walls.

A. abiantum nigrum.—A rather rare plant of the sub-alpine and mountainous region. Leaves 8 to 12 inches in length, rachis dark brown. The general colour of the plant is dark green, and very glossy. It likes a light porous soil, mixed with a few stones, and a warm though shaded situation.

A. Seebii.—A rare plant of the high dolomite mountains (Tyrol), at an altitude of more than 6500 feet. Fronds of three segments almost triangular, and but slightly developed, a rock plant, liking the sun and moisture.

Athyrium phiticum.—Of the lower Alps and Jura. A graceful plant, very finely cut, and showing much analogy to *A. Filix-femina*, from which it is only distinguished by a very small indusium, visible only in its very young state. A terrestrial plant, which wants a light and deep soil and a shaded situation. Its foliage is caducous.

Aspidium lonchitis.—Alps and Jura, in the limestone regions; it is one of the most beautiful of the Ferns of our part of Switzerland. Its aspect is truly noble and royal, and is very effective in our gardens. It likes a light peaty soil, and a cool and shady spot. Its foliage is permanent in winter.

A. lobatum is one of our most beautiful species, which should be grown in every garden. Its leafage, which lasts through winter, is of a very dark glossy green; it is a fine noble plant, of great beauty. This and the preceding species are the plants which, *par excellence*, are used by the ladies of Geneva to decorate their houses. Unfortunately both these plants are likely to disappear from our country, on account of their being hunted after in winter for decorative purposes. No longer can a single specimen be found on the mountain of Vonache, where formerly it abounded. It is strongly to be wished that people who decorate their rooms with Ferns and then throw them into the street as soon as they are over, would replace the plants by cut fronds with no roots stuck in wet moss; they sometimes last as long as the plants do. The Association for the Protection of Alpine Plants has taken these two plants under its special protection. *A. lobatum* is cultivated in the same way as *A. lonchitis*.

A. angulare comes very near to the preceding species, but is distinguished by the softer texture of its leaves, by its less acuminate segments, and by being strongly attenuate at the base. It is a rare plant of the Bernese Oberland and Tessin. For culture, see *A. lonchitis*.

A. rigidum is found in the calcareous rubbish of the Alps and Jura. The fronds are stiff, upright, and closely crowded. It is of greyish-green colour, and is caducous; it likes very rocky soil and a sunny exposure.

A. spinulosum is a plant belonging to the mountainous region. It is stately, with very broad and reflexed fronds, and is very elegant in appearance. It is a terrestrial species, liking shade.

A. dilatatum is a variety of the preceding species, with broader and more spreading fronds, and the scales on the rachis are of a very dark brown. It grows under the same conditions as the preceding.

Phlegopteris polyfolioides and *P. Dryopteris* are two very elegant species, which are found in the limestone districts of the Alps and of Jura. *P. Dryopteris* especially is pretty and graceful. The appearance of both is elegant, and their cultivation easy. They prefer a very rocky soil, a shaded but not too moist position.

Cystopteris montana.—Rocky and mossy retreats of the Alps, the lower Alps, and the Southern Jura. It greatly resembles *P. Dryopteris*, with which it is often

enfolded. It likes the same conditions as the *Phlegopteris*.

C. alpina (*C. regia*).—Alps and Lower Alps (Dole in the Jura). A very graceful species, greatly resembling *C. fragilis*, from which it differs by the teeth of the segments being notched and by the nerves which end in these notches. A truly rock species, liking moisture and shade.

Woodsia glabella, of Southern Tyrol; *W. hyperborea*, of Eastern Switzerland and of Tyrol, at a higher elevation than 6500 feet; and *W. Iteutis*, a very rare plant of Eastern Switzerland and of Tyrol, are three very pretty, very graceful and remarkable species, which are rarely cultivated in our gardens. They are among the smallest of the Ferns, but these charming little plants are, however, among the prettiest. All three belong to the granitic flora, and are only found in clefts of rocks or between blocks of stony refuse. They like a very stony soil, a little humus, and a rather moist sunny exposure. *H. Correvon*, Director of the Jardin Alpin d'Acclimatation, Geneva.

FOREIGN NOTES.

VEGETABLE PRODUCTS IN TUNIS AND TRIPOLI.—Dundee, it seems, has ceased to have the entire monopoly of the trade in jute. In a report from Tunis it is said that the jute sacks required for their grain export are no longer drawn from the Scotch town, but are now purchased second-hand from Belgium for 4*d.* each, instead of 8*d.* or 9*d.* as formerly. The large shipments of grain from India put at the disposal of European importers huge quantities of these sacks, and last year 200,000 were imported into Tunis at half the prices formerly paid. Olive oil is of course the most important article of export from Tunis, though there was a considerable falling off last year. The quality of the oil is inferior to that of Italy and Spain, but superior to that from Morocco and the Levant. By far the greater portion comes from the district of Susa, and Italy and France were last year the largest buyers. Besides olive oil there is a large export of olive refuse, which is what remains of the berry after undergoing the imperfect pressing in vogue among the Arabs. By hydraulic pressure a considerable quantity of oil can be extracted from this refuse, which is worked up into soap, and utilised in other ways. A factory for squeezing this refuse has just been set up at Susa by a French capitalist, which promises to be a financial success. While grain has been freed from the export duties which formerly fettered the trade, olive oil is still subjected to a duty of £5 per tun, which is a direct discouragement to agriculture.

The export of Esparto-grass or Alfa, as it is locally termed, has been more active during the past year. This valuable fibre, nine-tenths of which is shipped to the United Kingdom for paper making, affords a livelihood to the Bedouin Arabs, who load their camels with it and bring it a distance of 100 miles from the interior. The Government has not relieved it from the oppressive duty which for the last nine years has weighed upon it, amounting in the northern districts of the Regency to 12*s.* 6*d.* a ton, and to 17*s.* further north at Susa. The largest shipments take place from Sfax. The Alfa from Susa commands somewhat higher prices than that farther south. The unusually large quantity of the fibre which was exported from the Regency in 1881 was owing to a failure of the grain crops in the south, which drove the Arabs to Esparto plucking as the almost sole means of obtaining a livelihood. In 1882 the Arab tribes in the south fled over the border to Tripoli to avoid the French, and that year showed the lowest point to which the export of this grass has sunk. In 1883 shipments of Esparto began to be made from another little port to the south of Sfax, called Skira, which would under ordinary circumstances have found an exit at Sfax. Skira has been selected as the port of exportation by the Franco-English Esparto Company, which has obtained a concession to export that fibre from a certain district inland from Sfax, and which began its operation in 1883.

From Tripoli it is stated that business in Esparto, which had become very slack in 1884, had so far recovered itself as again to be in the position it occupied in more prosperous years. Notwithstanding the low range of prices—10*s.* to 15*s.* per ton below the usual rates of the last two years—the supply of this fibre has not diminished, but flowed steadily into market in even greater quantities than before. The

quality of the grass is better, as would appear from the general satisfaction it has given in England; and it is anticipated that both the quality and quantity in 1886 will be above the average. Freight for Esparto kept low, ranging from 9*s.* to 12*s.* the ton for hydraulic pressed bales, and from 16*s.* to 20*s.* for those mechanically pressed.

PRODUCTS OF NEW CALEDONIA.

The following notes on the products of New Caledonia are from a recently issued report by Consul Layard. Under the head of sugar, he says this article is chiefly grown by the Government by the aid of convict labour on the plantations of Koe and Nemba, and at the convict post of Bouril, all situated on the west coast. About 300 tons per annum are produced, but the fabrication of rum, to be used for convict rations, is the chief object. The sugar is not refined. The locust pest, which in past years was the great drawback to this industry, has not reappeared for the last two years; nevertheless private enterprise has not ventured to resume the cultivation of the cane. Lucerne also grows freely and yields a good return. Hitherto the chief supply has been from the Australian markets, but the Conseil-Général recently placed a tax of 3 francs (2*s.* 6*d.*) per 100 kilos. on this, straw, Oat hay, and all other forage in order to encourage and protect the growth of native produce.

Tobacco has been grown in large quantities about Ourail and Moindou on the west coast, but the supply has rather fallen off of late. It is of very superior quality, and is chiefly used up in the country, but it is an industry that might be much extended.

Banana cultivation should be a paying business seeing that it grows well in New Caledonia, and always finds a ready market in Sydney, where vast quantities are consumed. From its geographical position, Noumea, being half the distance from Sydney compared to Fiji, should command the market, and yet what are the facts? Every steamer in the bi-monthly service between Sydney and Fiji, carried on by the Australian Steam Navigation Company, brings from 10,000 to 20,000 bunches of fine fruit, each of which pays 1*s.* freight, an average of 15,000*s.* This amounts to £750, which, multiplied by 24, the number of bi-monthly trips, gives £18,000 for freight alone. The value of the whole of the fruit exported from the colony during the last year amounted to only 1030 francs, or £41 4*s.*

IMPROVEMENT OF PEAS AND OTHER PLANTS.

IN the trial grounds of a well known firm of seedmen there were growing in the summer 167 varieties of garden Peas which were sown side by side, so that the merits of different sorts might be tested by comparison. It is by such experiments as these that improvements are secured, and the Ringleaders, Alphas, and other Peas perfect of their kind, developed. A useful modification of this particular vegetable which is now in progress is the diminution of the haulm of the taller sorts. The value of a Pea depends on the character of its pods and the seed contained in them, and the height of some of the tall growing sorts is obviously a disadvantage. The firm in question therefore have set themselves the task of reducing the height of the crop without diminishing the number of pods. They employ their own hybridisers in the prosecution of this task, but like all others in the trade who undertake improvements of any kind they avail themselves of the labours of amateurs. There are enthusiasts and experts in every branch of plant improvement who devote their attention to a few, or perhaps to only one subject, and who attain such success as the professional experts employed by the various firms could hardly expect to accomplish, their attention being generally too much divided. It has happened, therefore, that the most noted breeders of fruits, flowers, and vegetables have been amateurs, and in the case of the Pea the most skillful manipulator who has outstripped all rivals in the work of improvement is a lady. By the magic of the various methods known to those who practise cross-breeding and selection, she has altered the Pea at will, both in reducing the superabundance of the haulm and also by enlarging the pods and seeds.

It can easily be imagined that a breeder of plants will desire, like an author of books, wide publication or distribution, and as he cannot be his own adver-

tiser, on account of the expense, he leaves this special business in the abler hands of one of the great firms of seedsmen. This explains the large number of Peas in the collection just referred to. The firm we have in view employ their own hybridisers in various departments, but they are always anxious to acquire the best of everything by whomsoever it may be originated, and from one source or another they have become the possessors of from thirty to forty sorts of cross-bred Peas of recent date. These have, in fact, been raised during the past three or four years, and all of them were grown last summer in the trial grounds, and subjected to a searching examination.

Among them is a sugary Pea of great merit, which grows side by side with the Duke of Albany, which is a good "all round" Pea, of excellent quality, and profitable for market. But the sugary Pea is not a productive kind. It is exquisite in flavour, but the haulm is deficient, and the pods and seeds are small, so that this incomparable Pea on the table is unfortunately a shy bearer and therefore unprofitable.

In the improvement of such a variety by the increase of the haulm and enlargement of the seeds, without loss of flavour, the breeder finds his opportunity, and when we consider that the marrowfat tribe have in some cases been reduced from 7 feet in stature to the much more convenient height of between 2 and 3 feet without any diminution of the size of the seeds and the yield of the crop, we may hope that the sugary dwarf will be enlarged and rendered more productive without loss of quality.

In passing along the rows, several sorts claimed notice, such as the little early Pea Bijou, which does not exceed 18 inches in stature, and the still more dwarfish American Wonder. By cross-breeding with such varieties as these the giants of the Pea tribe may be readily reduced to a moderate size; for if you cross a "first early" Pea with a tall late marrowfat, you will naturally be landed between two extremities both in regard to superabundant haulm and to the size of the pods; and perhaps the reduction of the size of the pods may cause them to be better filled and more numerous and productive as they are in some of the most prolific sorts whose pods hang invariably in pairs and almost break down the stems that bear them.

Many of the diversities we observe in different varieties of garden plants—both fruits, flowers, and vegetables—are entirely due to the skill of breeders and selectors in availing themselves of a universal law of Nature. They have observed what Mr. Darwin calls the "slight differences" between individuals and turned them to account in the artful moulding of a new variety. We need not confine ourselves to culinary plants. The history of the Fuchsia affords as good an example of the results of cross-breeding as that of the Pea. About half a century ago the only Fuchsia familiar to gardeners was *F. coccinea*, an old sort, which is still common in the gardens of farmhouses and cottages, in the southern counties. About sixty years ago new varieties of this flower were received from the seaboard of the Pacific, where the genus is very widely distributed.

The well-known Fuchsia fulgens of our green-houses, with exquisite long tubed flowers, is one of these, and another is the splendid Fuchsia Riccartoni, a hardy specimen, whose great bushes flourish in the West of England and in Scotland. Many persons must be familiar with Fuchsia corymbiflora, introduced by Messrs. Standish from Peru, a conservatory plant which is sometimes moved out-of-doors in summer when its long and waxen corymb of flowers impart a tropical aspect to the garden.

These are varied sorts, but the Fuchsias of the present day are unnumbered, and they have been produced by the skill of the same class of experts who have modified most of the cultivated plants in turn, amateur and professional hybridisers and cross-fertilisers.

The seed of a superior hybridised Fuchsia has been sold at the rate of 50 guineas an ounce, though no one ever possessed an ounce of such seed, the yield of an "improved" plant being in inverse ratio to the monostrality of the blossoms, for artificial modification is usually the reverse of that natural modification which sustains a plant in its struggle for existence; and the more highly plants are bred, the greater the disturbance of the reproductive system, and the greater the tendency to modification in their seedlings.

Our modern flowers are not like the old ones, and the gardens of the last century wore raiments widely different from those of to-day. We have shown how the

Fuchsia has been changed and its forms multiplied within a short period, and those who have not given much attention to this subject would be surprised at the number of flowers of which a similar story might be told. Most persons know the Antirrhinum or Snapdragon, but the "good old-fashioned" English flower known by that name will hardly be found now except in old-fashioned gardens. An eminent florist has preserved a plant of the old sort, for the sake of comparing it with the modern forms which owe their smart appearance to the arts practised on this and other flowers by himself. His unimproved specimen of this plant is a rampant straggler, with few blossoms—the Snapdragon of our boyhood, well adapted for large flower-beds, or a front position in shrubberies, where it might do battle with the Foxglove and the Phlox, or the Michaelmas Daisy. Modern Antirrhinums, on the contrary, consist of several "sections"—dwarf, intermediate, and tall, ranging from 1 to 2 feet in height, all of them having a compact habit, with many distinct colours in each section.

It would be a long story to relate the modifications of each particular florist's flower, and it seems needless to do so, since the same process of selection, with or without cross-breeding, has been applied to each one of them. Among the much changed plants are China Asters. Some plants are far more stubborn than others, but it is no wonder if Asters readily become mutable, considering the predisposition to change which repeated acts of cross-breeding invariably introduced by occasioning a mixture of breed and such a varied parentage that none can tell what freak of reversion a seedling may display. The Aster is one of those popular flowers which has been coddled by florists with wonderful solicitude. We examined half an acre of them growing last summer in a series of beds. Among the varieties were the Asters, known as Chrysanthemum-flowered, Peony-flowered, having the petals curved inwards, the pyramidal section, and some wonderful dwarfs not more than 7 inches high, and most profuse in the number of their blossoms.

As a rule, Aster seed is grown abroad, but an eminent firm of seedsmen are making an attempt to deprive foreign countries of the monopoly by producing it in England, their immediate object being the improvement of the flower, since the blossoms of home-grown seed have proved both brighter and more durable than those from German seed. The growth of Aster seed, even in our driest district, requires special care owing to the damp weather of autumn, which sometimes rots the blossom of this late ripening seed crop. The blossom may be saved, however, by protecting the beds with a light roof covered with some such material as Willesden paper, to prevent the ball of petals from becoming soaked by rain. With this reference to an incidental method of improvement, we conclude without having by any means completed what is in fact a "story without an end." *H. E.*

POMPON DAHLIAS.

I HAVE heard it remarked on several occasions of late that the pompon bouquet or Lilliputian Dahlias are taking the place of the single varieties. That the last-named are being cultivated much less than they were two or three years ago there can be no doubt: the flower-loving appear to be tiring of them. I do not wonder at it. New varieties have been raised, regard being paid only to the flowers, and nothing to the habit of growth, consequently those who purchased them found not a few to be of very tall growth, taking up a great deal of room, and hardly repaying the labour and trouble bestowed upon them. A few days ago I looked through the collection of single Dahlias grown at Slough: they had been planted out about the same distance apart as the show and fancy varieties, but they had grown so tremendously and so high that it had become necessary to pass cords along each side of a line of plants, to keep them within bounds, so that a person could pass along between the rows. Many an amateur has purchased single Dahlias only to find them smothering and overpowering everything else planted near them.

Pompon Dahlias have been cultivated in this country for over thirty years, but their beauty, usefulness, and value have never been considered so fully as they deserve to be. What I remember of the earliest varieties were plants of tall growth but always free flowering. Efforts were made

to secure varieties of dwarf growth and with success: Continental and English raisers essayed to do this, and one result has been the addition of some German varieties of great beauty and usefulness, and now there are over fifty recognised varieties in cultivation. At recent exhibitions we have seen pompon Dahlias shown in bunches, and they have been deservedly admired; but cut blooms, however beautiful in themselves, afford no means of judging of the habit of the plants from which they have been taken, which is a matter of great importance. To make a selection of varieties, one should see a collection in bloom.

A few days ago I had an opportunity of looking over Mr. Turner's fine collection at the Royal Nursery, Slough; and I could not help noticing that there were two distinct habits of growth to be perceived, and also two styles of flower—one small and compact, the other larger. Now, my ideal of a pompon Dahlia is a plant growing from 2½ to 3½ feet in height, compact and erect in habit, and throwing a profusion of flowers, erect and well displayed above the foliage; the flowers small, symmetrical, and freely produced. I made a note of the following varieties as coming up to my ideal, and I can confidently recommend them for decorative, cutting, or exhibition purposes. They are:—Garnet, bright orange-scarlet; Comtesse von Sternberg, yellow tipped with white—very pretty; Grüss an Wien, shaded buff or lively terra cotta—a very pretty variety; Princess Sophie Sophia, wine-crimson, the reverse of rays lilac; Henriette, yellow ground, tipped and suffused with crimson-purple; Hedwig Polwig, crimson, tipped with white; Professor Bergaet, bright or rosy-crimson; Little Duchesse, blush ground heavily edged with crimson-purple, a little tall, but very good; Fanny Weiner, yellow, edged with red, a little tall, but very good, and wonderfully free; Nemesis, maroon, tipped with white, good free habit; Titania, yellow, strikingly tinged with brownish-red; Thomas Moore, yellow, deeply edged with red; Mdlle. Valentine Faconet, white, striped with purple, erect, and very free; Fashion, orange and buff; Ernest, maroon, with rich crimson shading on the edge, erect habit; E. F. Jungker, amber, rather tall, erect, and very free; Louis Kodani, deep shaded lilac on a white ground, a little tall; Little Princess, blush, tipped with bright rose; Favourite, rich bright crimson shaded—a little tall, but perfect in form; Gem, a little tall, bright scarlet, perfect shape; Isabel, bright scarlet, petals slightly reflexed—a charming variety, a little tall; Lucy Blanche, a perfect white, a little tall, very free; White Aster, with charming fringed petals—wonderfully free; Hilda, pale citrine, with slight tip of rosy lilac—small, very free, a little tall; and Ivanhoe (new), the white rays having a lemon reverse, in some cases tipped with white.

Now I will defy any one to name an equal number of single Dahlias as dwarf and compact in growth, free, varied, and pleasing, as the list just given, and as satisfactory in all respects. All the foregoing throw their flowers erect and well above the foliage, not hanging them down as do many of the single sorts, and so mingling them with the leaves. I had only to pass from the collection of pompon Dahlias to that of the single varieties to know how certain is the challenge I have thrown out; and I can go the length of stating that grown in ordinary soil scarcely one in the aforementioned list would exceed to any appreciable degree a height of 4 feet. Then there is a group of pompon Dahlias not quite so compact and certainly taller in growth, though it can scarcely be said of any one that it is too tall for garden culture that have larger flowers not quite so good in habit, yet very free, and admirably adapted for general garden cultivation. The flowers being a little large are, in my opinion, too large for exhibition purposes as pompon Dahlias, though several of them can always be found on competing stands. They are Golden Gem, clear yellow; Rosetta, rosy-purple; The Khevide, white, heavily suffused with deep crimson; Fair Helen, white and lilac; Prince of Lilliputians, very dark maroon; Dora, pale primrose and white; Darkness, crimson maroon—very dark; Amelie Barbière, flesh, tipped with rose; Little Willie, deep flesh colour; Rosalie, pale primrose, tinted with rose; Profusion, crimson, tipped with white; Wilhelm Nitsche, red, tipped with white; Carl Mendal, bright rich crimson—a line of twenty-one plants of this is worth going miles to see; and Lady Jane, very bright pale red.

The pompon Dahlias have one claim upon the

flower-loving public that the single varieties cannot put forward—they are much more lasting in a cut state, and while the newer single Dahlias appear to be increasing in size to a degree that robs them of a good deal of their decorative value, we are having produced by Mr. Turner and others, small, compact, exquisitely formed pompon varieties that seem to be perfect in their way; and that they are destined to become increasingly popular I have no doubt. R. D.

THE ALPINE GARDEN.

POLYGONUM SPHEROSTACHYUM.—Ever as autumn returns we have a profusion of Polygons in flower, but none are more welcome or charming in their way than those that are truly alpine, or sufficiently dwarf and ornamental to secure their admission to the alpine garden. The species under notice is characterised by a more upright habit than *P. affine*, generally known in gardens as *P. Brunonis*, and if less adapted for creeping over banks and ledges than the latter it compensates for this deficiency by its dense, short, oblong spike of deep red, nodding, or pendent flowers. Owing to its erect habit it never forms broad, spreading patches like *P. affine*, but is if anything more accommodating to a restricted area, and deserving of cultivation even in a limited and select collection. There is a figure of this species in the *Botanical Magazine*, t. 6847. It is synonymous with *P. affine angustifolium*, and it has been cultivated in this country even under the name of *P. affine var. Brunonis*. The plant, in a wild state, is widely distributed throughout the Eastern and Western Himalayas, at elevations ranging from 11,000 to 15,000 feet, consequently cultivators may invest in it without hesitation on the score of hardiness. The Polygons generally are so easy to grow and require so little attention after being established that growers are on that account apt to undervalue them, although in doing so they are computing them according to a false standard. Any moderately good garden soil will suit them, provided it is tolerably moist, with a proper exposure to light.

POLYGONUM VACCINIIFOLIUM.

There are few probably who would not reckon this the best of the genus for rockwork purposes pure and simple, for although it lacks the intensity of colour peculiar to *P. spherostachyum*, the delicate pink hue of its slender cylindrical inflorescence coupled with the miniature leaves, resembling, as the specific name implies, the foliage of some species of *Vaccinium*, all combine to give the plant that refined appearance to which it justly owes its popularity. Like the above species it appears to be a common and widely distributed Himalayan species, ranging at an altitude of 11,000 to 13,000 feet. According to the experience of some cultivators it seems to lose its leaves to some extent in exceptionally severe winters, but beyond this its cultivation is attended with no difficulty whatever. The plant will grow in either sun or shade, but seems to flower much better if freely exposed to the sun. Cuttings taken off at a node root readily in sandy soil under a hand-light or other similar protection, and this they will do the more readily if the shoots employed have been in contact with the soil, or if the weather has been moist some time previously. This applies to a great many herbaceous plants, and may be explained on the principle that such shoots under the conditions mentioned are generally disposed to throw out roots spontaneously, if the plant producing them is of creeping habit. The species under notice is figured in the *Botanical Magazine*, t. 4622, and flowers continuously from August to November.

CYCLAMEN NEAPOLITANUM.

Notwithstanding the fact that this plant habitually throws up its flowers unaccompanied by the foliage in the autumn months, it is, nevertheless, a highly ornamental and desirable plant when well grown. Large tubers grown singly and dotted about in somewhat shady nooks in the rock garden prove very attractive as summer gives place to the cooler and waning days of autumn. Large clumps, however, are more desirable where they can be accommodated, as such are more conspicuous and decided in their effect. A shady position is the most natural, and growth will be most satisfactory, and the foliage will put on its most attractive colours if the plants are well exposed to light, but screened, of course, from the direct rays of the sun. They do not require much moisture if so

shaded as to maintain a cool soil where the tubers are planted. Good drainage is also requisite for the better keeping of the tubers. The foliage succeeds the flowers later on, and is very handsome and highly marbled with grey on a deep green ground. If a mild winter succeeds an open autumn the leaves are a special feature in themselves where the plants are grouped, and exhibit much variety in the marbling. The flowers are white or rosy with a bright purple spot at the base of the petals, but exhibit a tolerable amount of variation from deep rose to pure white. Some individuals are more or less distinctly seceded. The plant is figured in the *Botanical Magazine*, xxiv, t. 49, and here belongs to *C. bellidifolium*, naturally in some parts of Assam and Kent, and figured in *Syone's English Botany*, 1136, 1137. J. F.

HOME CORRESPONDENCE.

The Autumn and Winter Crocuses.—At a time when the delicately tinted flowers of *Crocus speciosus* and other autumn varieties are expanding their blossoms it may not be amiss to remark on their extreme beauty, and their value in adding interest to the rock garden and the front row of the herbaceous border. From the time that the first large purplish blossoms of *C. nudiflorus* open, about the middle of September, until April, a succession of flowers may be obtained. They are not sufficiently plentiful to be sold at a cheap rate, and no doubt the reason for this is that they are not sufficiently known, else there is no doubt that a demand for them would arise, which would go on increasing until the trade would be compelled to propagate them in quantities in the same way as they do with the Dutch spring flowering varieties. Besides the two I have named *C. longiflorus* is pretty common, and all of the above are moderately cheap; but the handsome *C. hadriaticus* and *C. Boryanus*, the very pretty lavender-colored species, *C. pulchellus*, and others which were well known to Dean Herbert upwards of forty years ago, have now, I suppose for lack of interest in them, to be sold at half a guinea a dozen bulbs, whereas they ought, if sufficient interest could be aroused in their culture, to be sold at less than a penny per hundred. The winter flowering varieties must have the shelter of a frame or pit. There are not a great many winter flowering species or varieties but *C. Ancheri*, orange, and the violet and purple *saevoleus*, are the easiest to obtain. The remarks on Crocuses are naturally followed by some reference to the Colchicums. *C. autumnale* and its numerous varieties are well known, but the much more beautiful *C. speciosum* is not so well known as it ought to be; we have it planted in various positions, but it has done best on a ledge of a dry sunny bank facing the south. Here the bulbs produce grand flowers followed by immense foliage, almost as large again as on those planted in the borders. Three bulbs planted on this dry ledge, two seasons ago, have now produced twenty-nine blossoms which have a gorgeous effect. We have yet to learn a good deal about the best positions to choose for the autumn and winter flowering Crocus. Damp shady positions do not suit them any more than such positions do *Colchicum speciosum*. J. Douglas.

Prizes for Cottagers's Gardens.—I can bear personal testimony to the excellent practical results accruing from the system of awards for the best kept and furnished gardens in the different districts around Bury St. Edmunds, described by our able secretary of the Bury and West Suffolk Horticultural Society in a recent issue. As a stimulus to cleanliness and improved and increased produce nothing could I have worked better; the society by its awards to cottagers' produce at each of its shows, encourages the special culture of each fruit and vegetable, as Apples, Pears, Plums, Khabarbs, Potatoes, Carrots, Onions, Parsnips, Peas, Cabbages, Marrows, Runner Beans, and a general collection comprehended in the best basket. But as Mr. Gieve truly says, all this might be accomplished, and yet the general culture, order and keeping of the entire garden is considerably neglected. The prizes for gardens are considerably neglected, competent judges each season which used to be the condition attached to the prizes rendered slovenly culture or unprofitable cropping impossible to those that contended for and would win first honours. So

marked was the influence of this stimulus to good general culture in the gardens of the cottagers that after a little practice the judges seldom drew up at a garden that was not entered for competition. The difference in favour of the competing gardens was so great that the judges could read their driving, thus receiving a new illustration of the old adage, that those that run may lead. Besides, in awarding the prizes for the best gardens, other influences are considered besides those of mere utility. Under the prize system for produce alone the latter is apt to be unduly developed, and to lead to Potatoes, Cabbages, Peas, or Beans literally surrounding the front door or climbing in at the windows. Now, while utility, must ever hold the first place in the cottager's garden, there is no need for it to be the only principle recognised. By a very small sacrifice of space—if, indeed, it be a sacrifice—beauty may be made to drape the cottage and fringe the main path up to it. The judges were among the first to recognise, suggest, and even demand a certain proportion of flowers in the gardens of the cottagers. And not a few cases the smaller areas, as conditions of successful competition, have expanded into admirable flower beds and borders, skilfully designed and admirably filled. First-rate Roses and other flowering plants and climbers and fruit trees may also be found on cottages and outbuildings. The cottagers have also found what some one has well said comes true in their experience, that beauty has proved even more profitable than utility. Even in rural districts, especially within an easy distance of large towns, there is now an active and profitable demand for choice flowers, as well as for good fruit and sweet, crisp vegetables. And thus the beauty prize of the cottager's garden is twice blessed—blessing his wife and children and neighbours, and also the less fortunate denizens of our towns, and bringing back yet another blessing, in the needless necessities, or even luxuries of life, from the neighbouring grocer's or draper's. Weedlessness is another primary necessity with prize-takers. No measure of success, or cumulative amount of yield, will compensate for the presence of weeds. Absence of weeds or dirt lies at the base of success. Only those conversant with the enormous loss of produce, of manure, and of labour incident to the growth of weeds in field or garden can appreciate the advantages of the lessons learned in and the examples given by those prize gardens of cottagers. D. T. Fish.

Aster and Stock Seed-saving at Forest Hill.—That seeds of Stocks and Asters saved in this country from good strains produce as fine a progeny as any saved in Germany has been abundantly proved during late years. The finest strains of quilled German Asters grown in this country are English saved. Recognising the fact that there is no deterioration in strains of Stocks and Asters when the seed is saved in this country, as is sometimes supposed, Messrs. Carter & Co. are largely seeding these two important annuals in their nurseries at Lower Sydenham. A large breadth of fine strains of Asters was planted out for this purpose, the leading types being the pyramidal, the Peony-flowered, and the Chrysanthemum-flowered, the latter being the largest in each. The excellent fine weather is very favourable to the production of fine seed, and it is being gathered daily. Wooden frames covered with light canvas are provided to place over the flowers by night, and in the day also when rain is imminent, but while it is fine the plants are fully exposed by day. The Asters are all planted in the open ground. The Stocks for seed are grown in pots, and they occupy raised stages so that the air can frequently circulate among them. A sowing broadcast is sown in the open air, but is sown so fixed as while it can ward off the falling rain, it does not obstruct the sun. There is a good crop of Stock seed which will be soon fit for harvesting. When grown in pots in this way on raised stages, mildew does not attack the seed pods as is too often the case where plants are growing in the open ground. There is no reason why, with proper care, a great deal of Aster and Stock seeds should not be maturing in this country instead of being imported from Germany and elsewhere. R. D.

Wasps.—What good news to those that have them not, though somewhat tantalising to those that have them in full average numbers or in excess; for the plague of wasps, like the terrors of sea-sickness, is the more endurable when widely shared. It therefore affords us scant consolation to read of some happy cultivators who have not seen a wasp for months, nor a wasp's nest this season, while they have been preying on our Crapes, Peaches, Grapes, Pears, as usual, and we have been bottling them by myriads for weeks, and have already destroyed fifty nests in a small circuit round the gardens. I am not able to write with authority about the wasps to the north or the south of us, but here in the east they are all alive and seeking what they may devour as usual. As a new proof alike of their presence and presump-

tion, I may mention their raids on the sugar basins as being so persistent as to necessitate their flies covered while at tea and their attempts to share fruit pies with us in the dish, and in the transit from dish to mouth. Possibly the bold marauders are some of "R. D."s' hungry emigrants from the South. Not finding our Plums and Peaches sufficiently luscious to their taste they have gone in for sugaring them out of our tea and cooking basins. Be that as it may we have, as already stated, a full average supply of wasps distinguished by abnormal tenacity, and also an average supply of hornets. But the greatest plague of this somewhat peculiar season is bluebottle flies. For every wasp there must be a hundred of these devouring buzzing abominations that bring about such wholesale desolation and destruction among choice fruits. As a rule the bluebottles wait till wasps, hornets, or birds break the rinds. Then the bluebottles congregate in such masses as to drive the first aggressors and stronger game quite out of the field; wasps and all other creatures either so much dislike the company of the bluebottle or their buzzing din as to withdraw from them, and their habits to them are driven forth from them by the mere force of numbers. Either way, as a rule, the bluebottles finish what more powerful mandibles begin, but this year the flies mustered in such force, and were so impatient as to take the initiative on luscious Plums, Peaches, and late dead ripe Gooseberries. A row of Warriogtoos, carefully protected from birds, intended for late dessert, on a cool border, were skeletonized in mere rinds in a few days under the combined forces of wasps and bluebottles. The result was sending much of the appearance of a wasp's nest and a bluebottle hive until the work of destruction was completed. Neither is it an exaggeration to add that we have caught pecks of wasps and bushes of bluebottles in decoy bottles primed with beer. Were such successful traps more generally set, a sensible reduction might be made on those troublesome pests, not only in our gardens, but in our homes. So soon as the north-east winds pinched them out of the gardens they flocked in numbers and from morning to evening their loud complaints have been raised against the plague of bluebottles this autumn. *D. T. Fish.*

Variation.—I send plants of the common variegated Ribwort's grass, which turns green here under an arch or bow of Laurels some 30 feet high, where I do not think direct sunshine ever reaches them. Is it because plants have greater difficulty under such circumstances in forming a sufficient supply of chlorophyll (and so oblige all the available leaf-surface to be devoted to making it) that makes variegated plants often lose or lessen their variegation?—for example, many of the inner leaves of *Aucuba japonica*, as compared with those most exposed to light. In the variegated common Rush, the flowering stems of which almost invariably lose the yellow stripe below the inflorescence (while retaining it above), there appears to be another instance of absence of variegation where additional vigour is required. A record of peculiarities in variegation, many of which must fall under the notice of all gardeners, might be of considerable use to future workers as the subject of variegation, especially as its laws seem to be as yet so little understood. The enclosed *Aucuba* leaves are from the same plant. *C. M. Owen.* [Some very important questions are here raised. A dark green colour externally associated with an internal development of palisade cells filled with green colouring matter) is usually taken to indicate the necessity for full exposure to sunlight. That this is not universal, however, is shown by the fact that Holly and other plants of a dark-leaved variety do as well and generally better in shade than in full sunlight, and this is in accordance with our correspondent's statements. Perhaps in the shade a larger amount of chlorophyll is required to do the same amount of work as in the direct sunlight, where a lesser amount is necessary. *Ed.*]

Azalea Deutsche Perle.—Any one desirous of having a thoroughly good early flowering white Azalea, should grow her as soon as at the Royal Nurseries. Although they may be seen a large batch of Mr. Harry Turner states that he shall grow it largely for cutting purposes, the flowers being well double, pure in colour, and very early in flowering. It is a fine decorative variety also, the flowers being freely produced, and of perfect form. Next in point of value as a white flowering Azalea, Mr. Turner puts *Narcissifera*; it is a good grower, very fine also, a good forcer, and in point of time follows *Deutsche Perle*. The latter is a Continental variety. *R. D.*

Bees and Colour.—It is asserted by many that colour has no influence on bees—that, in fact, they are colour blind; while others, with a little more reason on their side, maintain that they are not influenced by any particular colour or colours, which, in other words, means that they have no preference for flowers of any particular hue. Looked at from various points of view the question is one which is

attended with serious though not perhaps insurmountable difficulties. At first sight it would seem an easy matter to enumerate an exhaustive list of flowers frequented by bees, and to calculate the relative number of visits what flowers they most preferred. In all probability the figures would be calculated to mislead, and most likely confirm the impression that bees are absolutely indifferent to any particular colour, or almost so. That the hues of flowers as contrasted with the green foliage serve to attract bees as well as insects in general, few, probably, would venture to dispute. But why (let us assume) this apparent indifference to flowers of particular hues? I am thoroughly convinced it is no choice of theirs, but urgent necessity, in order to eke out what must be to them a precarious subsistence, of which we have ample evidence in light hives in the autumn, with insufficient food to support the inmates till the following spring. There are various reasons to account for and support these statements.

In the first place there has been a wholesale destruction of the flora through cultivation, drainage, and other minor and concomitant influences. In true the fields are occupied with flowering plants, but either they are not melliferous (Wheat, Oats, Barley), or they are not permit of to flower (Turnips, Cabbages, honey-bearing weeds), or our hive bees are more or less unable to extract honey from them (Lucerne, red Clover, Peas). On the other hand, our woods and plantations are filled with many exotic trees, our gardens and shrubberies replete with herbaceous and shrubby plants, many of which are foreign to British insects. The bee population has increased under man's care, but with the increased competition and the decrease of their familiar flowers, it is no wonder that bees in general have been driven to their wit's end and obliged to fall back upon their intelligence for increased resources and application of means to an end. Having admitted a certain amount of intelligence (and who would deny it?), it is easy to conceive they have to a great extent lost or abandoned one of the means being the original instinct with regard to their preference for the particular colours by which they were wont formerly to detect the flowers most suited to their requirements. Bee-keepers would do well, where flowers are scarce, not only to note this fact but to act upon it by growing in quantity some of those honey-producing flowers where hive bees have no difficulty in getting at the nectary. In all these statements it will be inferred that our hive bee (and the same applies to many of the wild ones) has perforce to get educated to an artificial kind of existence. Rustics can remember in their early youth that wild bees once swarmed where it would now be difficult to find a nest to plunder. Bees have other powers of discerning what flowers contain honey, such as the faculty of smell, and this is evidenced by their habit of perforating the base of those flowers containing honey, but which they are unable to reach in a legitimate manner, owing to the length of the tube of the corolla. Arrived first, doubtless, by the colour of the flowers of *E. Eweriana*, and then probably by the smell of honey, I have witnessed bees struggling in a vain endeavour to gain admittance both by fresh and withered flowers. The Poppy and the Crocus are two instances of highly coloured flowers that contain no honey, but which are frequently visited by bees for the sake of their pollen. As their odour is more often disagreeable than otherwise (at least to our olfactory nerves) or altogether scentless, it is more than probable that bees are attracted by the gay colours alone, but as in the case of Crocus varieties they exhibit no preference for any particular hue. Roses, with their large and showy flowers, are also visited for their pollen, and British species at least do not appear to be melliferous. A rather striking instance of the secretion of nectar is exhibited by the huge ephemeral and brilliantly coloured flowers of *Tigridia pavonia*. The narrow inner segments of the perianth are strongly revolute longitudinally along the sides and again involute at the extreme margin. In this state the honey is secreted, and may with great difficulty be extracted. I have been (it would be rash to deny) are first attracted by the brilliantly coloured and spotted flowers, and becoming aware of the presence of honey, struggle with great persistency to reach it, and are reluctantly induced to quit the flower if any one shakes it violently, or employs other rough treatment. *J. F.*

Bulbs that are Cumulative beneath ground.—Of these I have noted the following:—*Asium arvense*, *Narcissus pinnatifidus*, *Lilium candidum*, *Ophrys apifera*, as likewise the roots of *Nontia adonis*, *Epipactis latifolia*, and *Epidendrum acule.* *A. D. W.*

Messrs J. Cocker & Sons' Roses.—Permit us to refer to the report of the Royal Caledonian Horticultural Society's show as contained in your issue of the 18th ult. It is there stated that we were surprised at being awarded the 1st prize for thirty-six Rose blooms. We are at a loss to know to what authority

your correspondent makes such a statement, for in the opinion of competent judges our exhibits were a good many points ahead of the 2d prize lot, and we would indeed have been greatly astonished had we been placed 2d. Had the judges' decision been otherwise than it was, we would certainly have protested against it, and done so simply on the merits of our Rose blooms, and the fact that they were distinct and properly named, as required by the schedule. It may be mentioned that the larger class contained a box of thirty-six Rose blooms, and not twenty-four as reported. We trust you will take an early opportunity of correcting these misrepresentations. *James Cocker & Sons.*

Germination of Seeds.—With respect to the germination of seeds of *Primula*, it is noteworthy that in the case of all garden kinds, such as *sinensis*, *Primrose*, *Polyanthuses*, *Auriculars*, &c., the better the germination, and the quicker, if seeds be sown as soon as well ripened. I believe that principle will be found to hold good with most seeds, with regard to pure species to have but to note what is the commonest soil in the garden of *Nature*. The bulk of these bloom in the spring, and without doubt it is in the natural course of things that the seed falling on to the soil around the plant, literally on the surface, soon germinates, and thus a succession of plants is produced for each blooming season. I think it is probable that very much of the failure incidental to sowing seeds of *Primulaceae* and some other similar things arises from the common practice of sowing the seed over for a year before it is sown, or perhaps purchased and sown. As to whether seeds should be buried or otherwise, I think all experience goes to show that, from lack of some proper covering vast quantities of seed are destroyed. One rule as to the seed being covered to a depth equal to its own density may not be always correct, but in the case of small seeds it is fairly so, hence I think those who cover all *Primula* seed just about its density with fine sandy soil, will be right. Very possibly when sown in pans, too much water may be given, perhaps too little. It requires considerable care to make artificial conditions accord with those found in *Nature*, and doubtless that lack of care leads to many failures. A thin layer of clean moss laid over a seedpan very often produces natural conditions which lead to success; especially does this covering tend to counteract the evil effects of injudicious waterings, and indeed materially helps to render frequent waterings of the seedpans needless. *A. D.*

Calandrinia umbellata.—A recent reference to the value of this pretty dwarf perennial induces me to point out that, when raised under glass, seedlings are extremely liable to damp off, unless the soil be very thinly sown, and in sandy soil. I have found that the best method of procuring a stock of plants is to sow a packet of seed in the open ground, in sandy soil, scattering the seed rather widely, and leaving it to chance. A moderate number of seedlings may always be reckoned on, and these should be carefully transplanted, before they get too large, to any desired position. *Spartan.*

Vale Royal Gardens.—This, the Cheshire estate of Lord Delamere, is about 2 miles from Great Northwich. I have on a former occasion drawn attention to the way the gardens are kept up, and a recent visit convinces me that the estimate I formed a few years ago about these gardens and the able gardener was a correct one. I stated then that I had visited nearly all the celebrated gardens in this country and on the Continent, but had not seen anything to surpass the high-class gardening carried out at Vale Royal. About ten days ago I paid another visit to this well kept place, and found it impossible to detect a weak spot. The flower gardens and borders contained all the elements that go to make up a perfect picture—things new and old are to be seen in abundance—all harmoniously blended, and giving abundant evidence of foresight and the picturing the far-off effect of present work. The new conservatory is admirably adapted for the purpose intended, which is more than can be said of the majority of such structures, inasmuch as they are usually erected after the design of an architect who is altogether ignorant of the necessities of plant life. The *Celsia pyramidalis* formed a magnificent feature in this building. This plant is invaluable for decorative purposes when grown in the way I saw it at Vale Royal; the rich oriental colours mixed judiciously amongst other flowering and ornamental plants presented a picture which was worth travelling many miles to see; but perhaps the most striking effect was the space-roofed house, the roof of which was covered with *Allamandas*. Here, too, Mr. Milne pointed out the three plants which had produced this marvellous result; they are in 32-sized pots, which are filled with roots, and this appears the only way of flowering *Allamandas* successfully. These three plants must have produced some thousands of blooms. *Allamandas* are done in grand style, and must have a fine effect when in bloom. Fruits of all kinds are

equally well done, and I am sure that I am not exaggerating when I say that it would be impossible to find a finer house of Grapes in the country than that now to be seen at this place. Peaches and Nectarines have also been very fine, and I feel sure that any person who has seen these gardens lately will say that I have not used the language of hyperbole. *Bruce Findlay.*

Grapes at the Last Meeting of the Royal Horticultural Society.—In reading the criticism on Grapes by "Vitis" in your last issue of the *Gardener's Chronicle*, I see he is displeased with the position of the 1st prize bunches of Mrs. Pearson. I may inform him they were not Mrs. Pearson's, but Royal Vineyard; that accounts for their being so much out of character with the other exhibits. *M.*

A Large Emperor Alexander Apple.—I gathered a few days since a large Apple Emperor Alexander that weighed 1 lb. 3 oz. and which is 15 inches in circumference. Is this not rather an unusual size? *Hopkins, High Cross, Framfield.* (In the Horticultural Society's minutes, October 7, 1834, E. G. Barnard, Esq., is stated to have shown one of 17 oz., so that your fruit is the heaviest of which we have any record. *Ed.*)

Orchids with Abnormal Flowers.—I know of a woodland in which, perhaps, one half the plants of *Listera ovata* (the Twayblade) have two flowers instead of one issuing from the axils of the bracts. In some cases as many as half a dozen twin flowers were counted on a single plant. A specimen of the Butterfly *Habenaria* (*H. bifolia*) with six pollinia instead of two, and all perfectly formed, I likewise secured during the present season. *A. D. W.*

TRIENTALIS EUROPÆA.

A VERY charming little plant, nowhere very common, but occurring in woods in the North of England and Scotland. In its manner of growth it is not unlike Herb Paris, especially in its whorl of leaves just beneath the umbel of white flowers. The stem, however, is more wiry, the leaves are much smaller, and the flowers are those of a *Lysimachia*. The root-development is very curious, as may be seen from the accompanying illustration (fig. 90), where A represents the seedling plant with the radicle and caulicle; B shows the seed, with the seed-leaves still enclosed; C shows the formation of a lateral runner, at the end of which is developed a small tuber, as at D. This tuberous development at the end of the underground branches is similar to that of the Bindweed, *Convolvulus*, and is a special provision for ensuring the distribution and perpetuation of the species analogous to that afforded by the Potato. A tuberous Primrose, for such this plant is in a broad sense, will perhaps excite some surprise; but, better still, it may induce some of our amateurs to study the habit of the plant, and so ensure its successful culture. Cribbed and cabinet in a flower-pot, as it is sometimes seen in botanical gardens, it certainly is not seen to advantage.

WILLERSLEY CASTLE, CROMFORD.

No one having a penchant for the picturesque should fail, when he finds himself in that most charming part of Derbyshire, Matlock Bath, to pay a visit to Willersley Castle, the residence of F. C. Arkwright, Esq. From Matlock to Cromford is a pleasant walk of under 2 miles, along the valley of the Derwent, the river running almost by the side of the road the whole of the distance. But before the visitor leaves Matlock the cliffs, which rise up abruptly and almost perpendicularly on the left hand, and close to the river, mark the outline of the pleasure grounds attached to the Castle. The Castle is situated on the summit of a high limestone rock; below winds the silvery Derwent, at the foot of another cliff on the opposite side of the river. The carriage drive enters from the road leading from Matlock to Cromford, at the foot of the cliff and between it and the river, and then passing over Cromford Bridge, which spans the Derwent, turns to the left, and so reaches the Castle by a winding route under the shade of lofty trees. On one of the stones forming the parapet of the bridge it is recorded that in June, 1697, a frightened horse ran away with its rider, and leaping the parapet on to the rocks forming the bed of the river, both were dashed to pieces.

The manor of Willersley is of ancient origin. Its

records date back for a considerable period. In the reign of Henry VI. it belonged to Richard Milner, Esq., who conveyed it to Sir Robert Leigh. In 1595, so the local records inform us, Henry Talbot, a youngson of Gilbert, Earl of Shrewsbury, died seised of the manor; Gertrude, one of his daughters and co-heiresses, married Robert Pierrepoint, Earl of Kings-ton. Then by marriage it fell into the hands of Edwin Lassels, Lord Harewood. In 1778, Lord Harewood sold it to Edmund Hodgkinson, who resold it to Thomas Hallet, Esq.; of the latter gentleman the late Sir R. Arkwright purchased it in 1782.

The Castle stands on the south side of a commanding eminence, which runs from west to east, and terminates the extensive range of rocks that form the eastern boundary of the Derwent in its course through Matlock Dale. Round the foot of the hill the river flows in a grand sweep for some distance to the east, but afterwards resumes its former direction to the south, and pursues its way through a more open country to its junction with the Trent.

Immediately opposite the front of the Castle on the south side of the river runs an immense perpendicular limestone rock, which forms the western barrier of the Dale; through it a passage has been made to admit the entrance of the new road from the south. From this spot the building is seen to great advantage, its castellated appearance, judicious proportions, exact symmetry, and the surrounding scenery, form a *coup d'œil* that is but seldom witnessed.

FIG. 90.—TRIENTALIS EUROPÆA.

The Castle consists of a body in the form of an oblong square, having a circular tower rising from the centre of the roof, and a semicircular tower projecting from the front, on each side of the entrance, and two wings, with a round tower at each angle. The whole structure is embattled, and the eastern walls are of light freestone. The spot on which it stands was originally occupied by a large rock, in the removal of which about £3000 was expended by the late Sir Richard Arkwright. The edifice was covered in some time in the year 1786, and before it was inhabited it was set on fire, by means of a stove that was over-heated, and all that was combustible in it was consumed. This accident happened on August 8, 1791.

The town of Cromford is distinguished by the founder, Sir Richard Arkwright, that most ingenious mechanic, having established the first cotton mill, in 1771, erected in the county, and the first upon so large a scale in England. His astonishing and wonderful penetration may be discerned in the very choice of a situation so suitable to carry on his extensive plans and operations, which laid the foundation of that immense wealth now enjoyed by his family. The mills are supplied from a never failing spring of warm water, which also proves to be of great advantage to the Cromford Canal in severe seasons, as it rarely freezes, in consequence of a portion of water from the spring flowing into it. The mills are now worked by the grandson of the eminent founder. Close by and near to the bridge is the church, which was begun by Sir Richard and completed by his son.

The gardens and pleasure ground of Willersley Castle, extend over a space of about 8 acres. They

grounds have great variety and beauty. Between the Castle and the Derwent is a verdant lawn, which slopes somewhat precipitately from the house, but afterwards inclines more gently towards the river. The east end of the river extends to Cromford Bridge, which stands about a quarter of a mile from the Castle, near to the entrance to the grounds, which opens by a small but very neat lodge. The summit of the Cromford Rock, which has been noticed as rising directly in front of the Castle, is beautifully fringed with trees and underwood, and though towering to a considerable height, it does not terminate the prospect from the Castle, which being elevated in situation almost at the top of the rocks, commands a view of the hill that rises beyond it, called Barrel Edge or Cromford Moor.

The hill behind the Castle rises to a considerable height, and is covered with wood to its summit, as is also that portion of it which extends eastwardly. The coach-houses, stables, &c., which stand near the mansion on this side, though in a more elevated position, are concealed by trees. In the midst of the wood are several romantic rocks, round which, and on the acclivity of the hill, the principal walk runs in a circle of nearly a mile. The walk leading from the Castle to the west gradually turns to the north, taking a direction parallel to the course of the river, and passes under semi-perpendicular rocks, though yet elevated to a great height above the stream. The rocks are in some part bare of vegetation, but are

occasionally fringed to the tops with trees, particularly the Yew and Ash, the roots of which insinuate themselves into the clefts and fissures in a singular manner. Advancing up the walk towards the point called the Wild Cat Tor, the eye is delighted by one of the finest scenes that Nature has produced. It consists of a long rampart of rock, opposite Matlock, down upon which the visitor looks from a great height, and from this elevation magnificent views of the country can be had both to the right and to the left. The walks were laid out under the direction of Mr. Webb.

The flower and kitchen gardens are situated on an elevated slope in the rear of the Castle; on the west side, nearest to the river, is the flower garden, divided from the kitchen garden by a lofty wall; against this, on the flower garden side, are trained various creepers and flowering shrubs; among them were specimens of the charming *Tropeolum speciosum* in full bloom. It is an old-fashioned flower garden of a delightful character, with annuals, biennials, and perennials; a garden in which there is always something in flower, from early in the year until near Christmas. At the top of the slope is a spacious conservatory filled with flowering plants, conspicuous among them some large specimen *Fuchsias* of ancient character, that are reported once in two years or so. It would be almost impossible to imagine *Tasconia exoniensis* in greater freedom and more ravishing beauty than it is to be seen here. Two plants of it are in pots, one at each end of the central bed, the pots standing on the soil into which the roots have penetrated. Mr. Borlase, the gardener at Willersley, considers it superior to T. Van

Volxemi for the purpose, as it blooms with marvellous freedom. It is trimmed back pretty closely at the end of the autumn each year.

Entering the kitchen garden, there is seen at the top of the incline a series of vineries, plant and Melon-houses, running north to south, and opening at the back into a glass-covered wall of considerable height, and some 8 feet or so in width. A portion of this glass wall is planted with Vines—on the front of course. Peaches and Nectarines are trained to the walls at the back, and over curvilinear trellises in front. Very fine fruit of Stirling Castle, Violette Hâ-ive, Early Beatrice, and other Peaches are grown, and of Earlage, Violette Hâtive, and other Nectarines. In the late house were trees of Chancellor Peach at the back, with Royal Kensington Peach and Lord Napier Nectarine in front. In one portion Figs are doing well, the Brown Turkey being particularly noticeable.

The early vinery is a small span-roofed house, not more than 9 feet in height, planted with Black Hamburgs, and from this house as many as 400 serviceable bunches are cut. The main crop vinery is planted with Muscat of Alexandria, Barbarossa, Alicante, and Muscat Hamburg. The late vinery contains Lady Downe's principally, and Alicante. Melons and Cucumbers, also Tomatos, are largely grown. The collection of plants is a limited one, fruit being preferred.

From the vineries the walled-in kitchen garden slopes southwards, and it is well stocked with good crops of leading vegetables. In this locality, excepting Plums and Pears, outdoor fruits on walls are a somewhat precarious crop, and this has led to such an extension of fruit culture under glass.

The grounds are admirably kept by Mr. Borlase, and every part of the gardens and grounds is maintained by him in a highly satisfactory manner. Grand timber trees are here. Beech in magnificent proportions, Oak and Elms also, and some of the Fir tribe. The grounds are well furnished with dense banks of shrubbery, evergreen predominating, consequently the grounds are well clothed with leafage in winter and spring. On Mondays during the summer the grounds are thrown open to visitors, and a great many of the excursionists to Mallock avail themselves of the privilege of visiting Willesley, undoubtedly one of the most charming and picturesque places in this district of Derbyshire. R. D.

COLONIAL NOTES.

WINTER FLOWERING PLANTS IN VICTORIA, AUSTRALIA.

WINTERS here are of course very mild in comparison with those of Britain, yet we feel the cold perhaps as much as do many of our countrymen in the dear old land, owing to the fact that our summers are so much hotter, and consequently more debilitating to us, leaving the blood poorer; hence we now observe people clad in winter garb, all anxious to keep as warm as possible. True we have to go many miles inland to see (or feel) snow and ice—say, to Macedon ranges, to those in the Gippisland, or to the great dividing range. We cannot, as a rule, see anything here to remind us of our English schoolboy days, and we are content—the frost is sufficient. Several recent frosts have left their marks on susceptible plants, such as *Asclepiha excelsa*, *Aralia papyrifera*, *Arcaucaria Bidwillii*, *Fourcroya gigantea*, *Solanum Warscewiczii*, and *Wigandia urens*. Still the plants named, though disfigured a good deal, will recover after the commencement of spring.

Our winter, so far, has been a very dry one for garden operations, much of the ground now being trenched or dug shows no sign of the penetration of moisture; this is to be regretted, as work becomes all the more expensive, besides being longer delayed. We are just emerging from cold and short days, and will soon be in a position to hail and welcome beautiful Spring. Indeed, signs of her approach are not wanting; for the *Acacia dealbata* trees fringing the Yarra River are already flowering, or, rather, they are showing occasional sprays of their golden-yellow blossoms, whilst *A. podalyrifolia* and several Australian and other plants are in a fairly advanced state, so far only as flowers are concerned.

Soon the chill and muffled figure of the winter maiden will give place to that of her cheery sister

queen amongst the flowers from many climes, all of which will soon be rejoicing together in friendly rivalry in our gardens, and which are so soon to yield of their abundance to flower lovers, owing to her genial influence!

Passing up Swanston Street a few days since, I came to the shop of a well-known florist, Mr. William Paton, in the windows and on the counter of which, were some very choice winter flowers in good variety as well as in quantity, and as it may possibly interest some of your readers at home to know what we are fond of here (and all of which find a most ready sale), I will enumerate them:—A large bouquet of Violets, 1 foot across, also many smaller bunches of the same—the *Czar* being in principal favour and use; then *Ilyacinths* and *Narcissus* in good variety; *Camellias*, *Snowflakes*, *Cyclamens*, some well grown varieties of the last in pots; also in large quantities the beautiful English wild yellow *Primrose*, and some good pot specimens of Chinese *Primula*, in full flower.

In the Melbourne Government Botanic Garden, and also in some private gardens, may be seen plants, still in flower, which have been doing good service during the whole, or in some few instances only in the latter part of the winter; they are:—

- Adenium autilora*
- Agavea celestis*
- Aloe arborescens*
- .. *ciliaris*
- Azoreum splendens*
- Banksia eriodifolia*
- Borreria officinalis*
- Butterflya madagascariensis*
- Calla albatra*
- Chrozema cordatum*
- Chrysanthemum* (Pyrethrum) *coronarium*
- Cineraria* (garden varieties)
- Correa speciosa*
- Cydonia japonica*
- Dasylone Fortunei*
- .. *indica rubra*
- Echeveria retusa*
- .. *secunda*
- Epacris impressa* pink and white varieties
- .. *pavilionia*
- Erica arborea*
- .. *Downiana*
- .. *crenata*
- Eriostemon myrsinoides*
- Grevillea alpina*
- .. *laxiflora*
- .. *crucifolia*
- .. *macrostylis*
- Grevillea elaeoides*
- .. *paniculata*
- Hovea longifolia*
- Kennedia Comptoniana*
- Lavandula stoechas*
- Lantana lustanica*
- Lonicera capitata*
- Narcissus*, in good variety (*Grevillea* of *N. calathinus*)
- Olea la panosa*
- Osbeckia*, various
- Poligala grandis*
- .. *myrtilloides*
- Prostanthera monophylla*
- Pultenaea subumbellata*
- Saxifraga ciliata*
- .. *orniculata*
- .. *rotundifolia*
- Tritoma aurea*
- Veronica Andersoni* var. *leucolobes*
- Viburnum tinus*
- Viole*s, *The Czar*, also the commoner, including white varieties; then we have *Wallflowers* (*Cheiranthus Chiri*) in good form and variety.

In transition from winter to spring the following, now beginning to flower, are worthy of notice:—

- Acacia cultriformis*
- .. *dealbata*
- .. *podalyrifolia*
- Arbutus Unebo*
- Foruma megastachya*
- Kentdia monophylla* alba
- Lhotskya genetylioides*
- Magnolia spectabilis*
- .. *superba*
- .. *Yulua*
- Micromyrtus microphylla*
- Myosotis palustris*
- Protea cynaroides*
- Spiraea prunifolia*

I may add that our winter months are June, July, and August, so of course we actually commence with spring early next month.

HEDGE PLANTS IN VICTORIA, AUSTRALIA.

It may interest some of your readers residing in similar latitudes to ours to know the kinds of plants so extensively used for ornamental hedges in Victoria; they are:—

Pittosporum eugenoides.—The only truly successful plant for growing near front fences of rather small gardens.

P. eugenoides requires more space than the others, and bears cutting equally well, but it has this additional quality, its ability to withstand road dust, which does not seem to injure it at all.

The following do well enough simply as hedge plants, though not to be considered ornamental:—*Ligustrum vulgare*.—Ordinary garden soil.

Lycium horridum.—Ordinary garden soil and sandy places.

Leptospermum levigatum.—Sandy places. *Acacia armata*.—Sandy places. *A. C. N.*, *South Yarra, Melbourne, July 28.*

HURRICANE IN JAMAICA.

Mr. D. Morris, late Director of Public Gardens and Plantations, Jamaica, now of Kew, has received the following account of the damage done at the Botanic Gardens, Jamaica, by the late hurricane. Mr. Hart, who is at present in charge of the several gardens, writes as follows:—

"I have again to be the recorder of bad news. Almost to the day—six years after the storm of 1880—we were visited by a terrific hurricane. We had noticed indications of it by the barometer at mid-day. By 3 P.M. the mercury was pulsating so as to render the movement quite visible to the naked eye. I

issued orders at once, and had everything secured as far as possible, and the buildings in consequence suffered but little damage—two washes and a few of the zinc covers to greenhouse being the largest extent of damage. But oh! the poor Conifers. You would be indeed grieved to see them; all the work of the last six years nearly destroyed. *Cinchonas* down by the thousand and large landscaps. Mr. Sullivan and myself have both lost our pines. On the day of the hurricane we had 12.10 inches of rain, and the three following days made up a total of 35 inches, equal to over 40 inches for the month, or a total of 160 inches since September 30, 1885.

"The Hope Nurseries have suffered greatly, while the fine *Teak* plantation is nearly destroyed, many of the trees being snapped off in the middle like matchwood, others blown over whole, several standing without a leaf. All the *Cacao* down, and *Nutmegs* also; but *E. Campbell* has done well—he had them all up and well stalked immediately. *King's House* has suffered more than in 1880, but the trees are of little value that are down, and some of them are perhaps better out of the way. Mr. Griffin has done his best to clear up.

"Mr. Hairs writes, 'Castleton is a wreck.' Many of the finest Palms have fallen, and also large numbers of other valuable trees. He sends also a list of damages covering four pages of foolscap. 'Cartshed blown away; thousands of cuttings and plants washed away, and the garden generally totally demoralized; parade and palisades have fortunately suffered no damage.'

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, SEPTEMBER 29, 1886.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				HYGROMETRIC DEGREES FROM GLAISHER'S TABLE 5th Edition.	WIND.	RAINFALL.

- Sept. 23.—Fine, but generally dull, bright at times.
- 24.—Fine day but overcast throughout.
- 25.—Fine, thin mist in early morning, generally dull, but bright at times.
- 26.—Fine rain falling in early morning, and frequent light rain during the day.
- 27.—Fine till 5 P.M., but wet afterwards.
- 28.—Bright in the morning, dull afterwards.
- 29.—Fine and bright day throughout.

LONDON: Atmospheric Pressure.—During the week ending September 25, the reading of the barometer at the level of the sea increased from 30.09 inches at the beginning of the week, to 30 inches by 5 P.M. on the 19th, decreased to 29.66 inches by 1 P.M. on the 21st, increased to 30.10 inches by the afternoon of the 23d, increased to 30.20 inches by 9 A.M. on the 25th, and was 30.10 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.98 inches, being 0.22 inch lower than last week, and 0.01 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 66°.1 on the 19th; the highest

on the 24th was 57°. The mean of the seven high day temperatures was 61°.7.

The lowest temperature in the week was 42° on the 23d; the lowest on the 21st was 52°. The mean of the seven low night temperatures was 46°.8.

The greatest range of temperature in one day was 23°.6 on the 19th; the smallest was 11° on the 24th. The mean of the seven daily ranges was 14°.9.

The mean daily temperatures were, 54°.2 on the 19th, 55°.9 on the 20th, 56°.9 on the 21st, 54°.6 on the 22d, 49°.2 on the 23d, 50°.9 on the 24th, and 52°.3 on the 25th. These were all below their averages, with the exception of the 20th and 21st, which were 0°.1 and 1°.4 above, by 1°.9, 0°.7, 0°.6, 4°.1, and 2°.5 respectively.

The mean temperature of the week was 53°.4, being 4°.7 lower than last week, and 2° below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was (15°.5) on the 20th. The mean of the seven high readings was 104°.6.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending September 25, the highest temperatures were 70°.2 at Cambridge, 67° at Truro, and 66°.1 at Blackheath; the highest at Sunderland was 59°, and at Sheffield and Hull 60°. The general mean was 63°.2.

The lowest temperatures were at Wolverhampton 34°.4, at Bristol 38°.6, and at Cambridge 39°.8; the lowest at Plymouth was 45°.5, at Newcastle 45°, and at Truro 44°. The general mean was 41°.4.

The greatest ranges were at Cambridge 30°.4, at Wolverhampton 29°.5, and at Bristol 26°.2; the smallest ranges were at Newcastle 13°, and at Sheffield and Hull 18°. The general mean was 21°.8.

The mean of the seven high day temperatures was highest at Truro 62°.9, at Cambridge 62°.4, and at Blackheath 61°.7; and lowest at Sunderland 53°.8, at Newcastle 55°.3, and at Bradford 56°.1. The general mean was 58°.6.

The mean of the seven low night temperatures was highest at Plymouth, 50°.3, at Truro 49°, and at Leeds 48°.1; and was lowest at Wolverhampton, 41°.1, at Bristol 43°, and at Sunderland 43°.1. The general mean was 46°.

The mean daily range was greatest at Cambridge, 18°.6, at Bristol 17°.1, and at Wolverhampton 16°.3; and was least at Newcastle, 8°.2, at Liverpool 9°.6, and at Bradford 9°.8. The general mean was 12°.6.

The mean temperature was highest at Truro and Plymouth, 54°.8, and at Blackheath 53°.4; and was lowest at Sunderland, 47°.3, at Wolverhampton 48°, and at Hull 49°. The general mean was 51°.1.

Rain.—No rain fell at several stations. The largest falls were 0.58 inch at Liverpool, 0.55 inch at Truro, and 0.25 inch at Sunderland. The general mean fall was 0.1 inch.

SCOTLAND: Temperature.—During the week ending September 25, the highest temperature was 63°.5 at Glasgow; the highest at Leith was 56°.9. The general mean was 60°.4.

The lowest temperature in the week was 36°.5 at Glasgow; the lowest at Leith was 41°.4. The general mean was 38°.7.

The mean temperature was highest at Glasgow 50°.9; and lowest at Aberdeen 48°.6. The general mean was 49°.9.

Rain.—The largest fall was 0.1 inch at Dundee. No rain fell at Glasgow. The general mean fall was 0.05 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, September 27, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather has been very cloudy or dull in all parts of the kingdom, but excepting in the extreme west and north-west the amount of rainfall has been slight.

The temperature has been below the mean in all districts; the highest of the maxima, which were registered on irregular dates, ranged from 58° in "Scotland, N.," to 68° in the "Channel Islands," and 70° in "England, S." The lowest of the minima were generally recorded on the 23d, when the thermometer fell to between 31° and 32° in Ireland, 36° and 39° in Scotland, and 34° and 41° in England.

In the "Channel Islands" the minimum was no lower than 51°.

The rainfall has been rather more than the mean in England, N.W., and "England, S.," and about equal to it in "Scotland, N.," and "England, S.W.," but in all other districts it has been less than its normal amount.

Bright Sunshine shows a very general and decided decrease, the percentage of the possible amount of duration ranging from between 15 and 21 over the greater part of England to 33 in the "Channel Islands," and 35 in "Scotland, E."

Depressions Observed.—At the commencement of the period a small depression lay near the mouth of the Channel, while pressure was highest over the north of our islands. By the 23d, however, this disturbance had dispersed in the neighbourhood of Brittany, and the high pressure system in the north was moving slowly down our western coasts, so that the wind, which had previously been fresh or strong from the eastward, backed gradually to the northward, and moderated. Towards the end of the period the high pressure had reached France, the wind in our islands had backed to the southward, and depressions skirted our western coasts. The disturbance shown on the 27th was large and deep, and caused fresh or strong south-westerly gales on nearly all our coasts.

Enquiries.

"He that questioneth much shall learn much."—BACON.

GRAPES.—Will "Vitis" (the writer of the article in last week's issue, p. 395) kindly say what he thinks the best black and also white Grapes to graft on Golden Queens growing with black Hamburghs which are not wanted to ripen until September? I find it the same as "Vitis" says—Golden Queen will not do in the Hamburgh-house, but with Mascats it finishes well. J. S.

Answers to Correspondents.

CELERY LEAVES DISFIGURED: D. P. The specimens sent are affected with the Celery-fly (Tephritis oenopodinis). The Celery-fly lays her eggs on the leaf, from

FIG. 91.—THE CELERY-FLY.

which maggots hatch out. These feed between the upper and lower sides of the leaf. When the insect is present in great numbers much injury results to the plants. Never throw the damaged leaves on the rubbish-heap, as that would be on a par with the Russian peasants who threw the eels into the river to drown them; but they should be burned. Sprinkling the leaves and the ground during June, July, and August, with a mixture of soot and lime will aid in keeping the fly away. After bad attacks, skimming off 4 inches in depth of the surface soil, and mixing it with salt and lime, will destroy many of the pupae.

BAROMETER, FRENCH V. ENGLISH: T. T. P. —

1 millimetre = 0.039 inch	1 inch = 25.4 millimetre
0.1 " = 0.0039 "	0.1 " = 2.54 "
0.01 " = 0.00039 "	0.01 " = 0.254 "
0.001 " = 0.000039 "	0.001 " = 0.0254 "

Some of the measures supply instruments with both scales. The following plan is sufficiently simple, and will answer for ordinary purposes.—The height of the meteorological column being given in millimetres, find the difference between the given height and the standard height of 762 millimetres; divide this difference by 25, or (which amounts to the same thing) multiply it

by 4, and point off two figures for decimals. Then, as the case may be, either add this difference to 30 inches, or subtract it from the standard height. Example—766 mm. = 762 + 4 = 30 inches + 16 inches = 30.16 inches. The true value is 30.157 inches. This rule is taken from Kämtz's Meteorology.

BOOK ON CHURCH DECORATION: Miss H. You have been misinformed. We have never published a book dealing with the subject of decorating churches, and do not do so now; but we have published in our columns a few articles on the subject. The following are the references:—In 1869, at pp. 1205, 1255, and 1307; and in 1870, at p. 496. These numbers, however, are now out of print.

BOOKS: WIRRAL Seed Stores. Insects Injurious to Fruit Crops. By C. Whitehead, Esq. Book on silk-worm culture is Mulberry Silkworm. By C. V. Riley, M.A., Ph.D. (Washington, U.S.A.: Government Printing Office). We do not know the price of this work. It forms one of the United States Department of Agriculture, Division Entomology, Series, and is Bulletin No. 9.

DOUBLE GLADIOLUS: W. H. Two flowers growing side by side have by some means become inseparably united, like the Siamese Twins. You will see it is a different case from true doubling.

FUNGUS: C. W. D. Clavaria pistillaria; not very uncommon. W. G. S.

GARIBALDI (SYN. VICOMTESSE HERICART DE THURY) STRAWBERRY PLANTS DYING-OFF: E. 7. We assume that you give all your Strawberry plants liberal supplies of liquid-manure of some sort at the roots during their growing season, and again when they are swelling their crops, and that this is sometimes, if not frequently, applied indiscriminately over the "crowns" of the individual plants, thereby causing, in connection with the action of the sun on the plants when so situated, the injury complained of; and under these circumstances it is only reasonable to assume that plants of the Garibaldi Strawberry are more susceptible of injury from this cause than the other varieties which you grow satisfactorily; and the fact of the "centre leaves flagging" prior to the plants dying while the roots are in a healthy condition, point to this conclusion. Therefore the remedy is obvious,—avoid wetting the "crowns" of the plants in giving them liquid-manure at the roots. Underhill's Sir Harry would make a good substitute for Garibaldi. H. W. W.

LARGE ELM TREE IN AN UNHEALTHY STATE: T. S. In your case there is not much to be done. The moss encrusting the tree can be killed during the winter with strong lime, or by dusting with powdered quicklime when the moss is moist. The active feeders of a large tree are at an unknown distance from the stem, so that your plan of supplying them with manure or fresh soil would present great difficulties and much labour. If the tree is not very old we should think that an undrained bad soil is at the bottom of the mischief.

MILDEW ON PEAS AND ON VINES: W. E. P. Peas are very subject to mildew on cold clayey soil, and on other descriptions of soil too, if water be not supplied abundantly during hot weather, and a mulch of half-decayed manure placed on either side of the row. The mildews of Peas and of Vines are not identical. The Vine mildew will attack your Vines only when the conditions favourable to its development exist in your vines, and you seem to be too good a grower of Grapes to permit that to happen.

MUSCAT OF ALEXANDRIA GRAPES: J. X. C. F. The berries of this Grape do vary somewhat in shape some being long ovate, others short ovate, never round. Those you allude to were certainly not round.

MUSHROOMS: J. P. A. The example sent is a true Mushroom. Such instances of spontaneous growth are frequent.

NAMES OF FRUITS: J. R. Hais. Plants: 1, Jefferson; 2, Reine Claude de Bayay.—W. R. Apples: 1, Hambleton Deux Ans; 2, Ribston Pippin; 3, Pomme Foure Blanche; 4, Ribston Pippin; 5, Pear, Williams' Bon Chrétien.—Joseph Green: 1, Passe Colmar; 2, Althorp Crassane; 3, Huyshe's Berganot; 4, Marie Louise; 5, Flemish Beauty; 6, Fondante d'Autonne; 8, Doyenné du Comice; 9, 13 and 14, Passe Colmar; 10, Autumn Berganot; 11, Beurré Hardy; 12, Lionne de Jodoigne; 15, Williams' Bon Chrétien; 16, Beurré Superfin.

NAMES OF PLANTS: W. E. Humphreys. The rose and white flower is Oncidium incurvum; the yellow and brown, O. spheaculatum. Please number specimens in future.—Pachanol. Pittosporum revolutum. We do not remember to have seen it in fruit before.—J. O. U. Lonitrea Ledebouri.—A. E. Rosa lucida, a North American species.—W. B. H. 1, Clematis tubulosa; 2, Cimicifuga elata? specimen insufficient.—Bruce. Should address the Editor, 1, Ross Street (near Macartney's Rose); 2, R. cinnamomum; 3, Pinus excelsa (probably); 4, Fuchsia microphylla; 5, Bambusa gracilis; 7, Jasminum grandiflorum. We have named six of the plants sent—our usual number.—J. F. 1, Desfontainia spinosa, 2, Hibiscus schizopetalus; 3, Zygocarpum Mackenzii; 4, Phyllanthus visosus; 5, V. Vanda tricolor; 6, V. Vanda; 7, V. Vanda; 11, Vaccinium Vitis Idæa, Cowberry. Leaves with small scales on the under surface, and with small pointed calyx-lobes at the top of the berry; 2, Arctostaphylos Uva-Ursi, Bearberry, with oblong or rounded calyx-lobes beneath the berry.

NOVA SCOTIA: A. T. S. Good Apples are grown in

the warmer parts of the peninsula, but whether there is a good opening to growers of fruits is a question that we cannot answer.

OAKS: L. V. B. The broader leaf is, we believe, Quercus coccinea; it turns of a beautiful crimson in autumn.

PEAS: Pictor. The sort is probably Daniel O'Rourke. We think that after making us pay 2d. on our letter, and 2d. more for the packet, as you now desire a copy of the paper to be sent you containing your letter you are putting a little too much strain on our good nature.

RUSCUS ANDROGYNUS: J. H. Suckers or brood will often spring from the roots of this plant, which can be taken off with roots when growing to the height of a foot or more, and laid in a pot, or as may be desired. Quite small suckers without roots can be taken from the mother plant as soon as seen protruding from the soil.

SHANKED GRAPES: An Old Subscriber. There is some fault probably in the management on the border, and without knowing the whole matter we cannot say what may have induced the disease.

SOILS: Hull. See Church's Laboratory Guide, also, the Soil of the Farm, by John Scott and J. C. Morton. SPECIFIC NAMES—"I" or "II." "ANA." II. D. Where the word is unequivocally a Latin one—*one* that was actually used by the Romans—the Roman rule as laid down in Latin grammars should be followed. Where the word is of any other derivation, an Anglo-Latin, *alias* dog-Latin, then the use of *i* or *ii* is a matter of fancy. For instance, the Romans wrote Virgilius as the name of him whom we call in English Virgil.

It seems to us easier, and more pleasant to the ear, to say Smithii, than Cooperi. Cooperi, that is Cooper's, Bath than Bathii, Halesii than Halesi, but perhaps to others this may not be so. In such a case the law of least trouble seems to hold good. As to the termination *ana*, it is a botanical name too often used for the Latin *ina*, which implies a mere complimentary designation, while *i* or *ii* implies, or should imply, some direct personal interest in the plant so named; thus Azalea Davisiana, feminine, or Rhododendron Davisianum, neuter, or Heliohelios Davisianus, masculine, would each and all imply that the name was given merely out of compliment to Mr. Davis. If, on the other hand, the name were written Rhododendron Davis, a botanist, or one familiar with botanical nomenclature, would rightly consider that Mr. Davis had either discovered the plant or been the first to describe it, or perhaps to raise it.

THE LATEST GOOSEBERRIES: J. Crook. Red: Echo, Roaring Lion, Overall. Green: Conquering Hero, Profit, Kelly's Thumper, very late. Yellow: Husbandman, Viper, and Ducking. Those in italics are of excellent flavour, and all are Lincolnshire price kinds, but none will be more delicious than the best of the Keen's Seedling, and Champaque Red, for dessert use.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION. J. Rogers. Apply to Mr. K. Cutler, the Secretary, 50, Parliament Street, Westminster, S.W.

VINES: J. M. S. A. The roots are most decidedly injured by the phylloxera. Root out all the affected vines and borders most thoroughly, and replant with vines from a phylloxera-free stock.

WRITERS ON BEES: Edwin Jackson. In answer to the inquiry in the Gardener's Chronicle of September 25, for names of writers on bees previous to the year 1700, I find in the Encyclopædia Britannica that there is a treatise by Butler, a gentleman of Oxford, called the *Frenzy Manoeuvre*, or the *History of Bees*, printed in London, L. W. See also the same work, but would be to apply to Messrs. Geo. Neighbour & Sons, of Regent Street, London, for a catalogue of the "rare books" on bees. Several in that list would suit Mr. Jackson. W. Chitty.

*• All communications intended for publication should be addressed to the "Editor." Such communications should be written on one side of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

INTELLIGENT READERS, DO PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

Markets.

COVENT GARDEN, September 30.

The subjoined reports are furnished to us regularly every Thursday, by the brokers of several of the principal salesmen, who revise the list weekly, and are responsible for the accuracy. It must be remembered that these quotations are averages for the week, and not the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price on any particular day, but less can they be taken as guides to the price in the coming week. [E.]

No alterations to speak of. James Webber, Wholesale Apple Market.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with columns for fruit names and prices. Items include Apples (½-weight, 1-weight), Figs, Grapes, Kent Cobs, Lemons, Melons, Peaches, Pears, Pine-apples, St. Michaels, Plums, & Walnuts.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with columns for vegetable names and prices. Items include Artichokes, Aubergines, Beans, Beet, Brussels Sprouts, Cabbages, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Leeks, Potatoes, & Spinach.

POTATOS.—Kent Regents, 6s. to 8s.; Schoolmasters, 7s.; & Beauty of Helston, 9s. per ton.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table with columns for plant names and prices. Items include Aralia Sieboldi, Asters, Begonias, Calceolarias, Chrysanths, Cyperus, Dracæna, Eucalyptus, Euonymus, Heliotropium, & Mignonette.

CUT FLOWERS—AVERAGE WHOLESALE PRICES.

Table with columns for flower names and prices. Items include Arum Lilies, Asters, Bouvardias, Carnations, Chrysanthemums, Eucharis, Forget-me-nots, Heliotropium, & Mignonette.

SEEDS.

LONDON, Sept. 29.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., state that there was a poor attendance on the seed market to-day, and with very little business doing. There is a fair inquiry for

winter Tares at the unprecedentedly low rates now ruling. Occasional orders for Trifolium still drop in; the section must not be considered as over. Clover seeds of all kinds fail to attract any attention. Blue boiling Peas are now offering at less money; the trade is not very active. Canary seed keeps steady. Hemp seed continues remarkably cheap. Some choice New Zealand Cock-foot is now obtainable at moderate terms. Other articles remain unchanged.

CORN.

MARK LANE: Sept. 27.—Although the receipts of English Wheat have been very moderate, and of foreign much lighter than recently, the trade ruled exceedingly dull for both descriptions. The former was sold occasionally rather in favour of buyers and for runs of English new white 34s. is now a very extreme quotation. Foreign Wines, without being quotably easier, also tended in that direction. Flour was sold in retail lots at the rates of this day week, but 6d. less could be taken for quantity. Grinding Barley met a slow sale at late rates. Good and fine malting Barley, being scarce, was very firm, but common qualities, of which the supply mainly consisted, met little attention. Beans sold steadily at previous rates. Peas did not meet much inquiry. Though Oats have arrived largely there has been rather more buying to-day, rates being upheld for all good corn.

Sept. 29.—No quotable change occurred in the value of either Wheat or flour to-day, but both were very firm to sell. Malting Barley met less inquiry, but grinding sorts, whilst quiet, were steady in value. Oats were rather firmer.

Average prices of corn for the week ending September 25.—Wheat, 32s. 6d.; Flour, 5s. 6d.; Oats, 18s. 6d. For the corresponding period last year—Wheat, 30s. 10d.; Barley, 31s.; Oats, 19s. 4d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Sept. 29.—Very good supplies of all kinds. Trade fair at prices as follows:—Apples, 2s. to 4s. per bushel; Pears, 2s. to 3s. 6d. 6d.; Cauliflowers, 2s. 6d. to 3s. 6d.; Potatoes, 2s. to 3s.; Cabbages, 2s. to 2s. 6d.; Vegetable Marrows, 2s. 6d. to 3s. 6d.; Turnips, 1s. 6d. to 2s.; Carrots, 1s. 6d. to 1s. 6d.; Onions, 2s. to 2s. 6d.; Celery, 3s. to 3s. 6d. per ton.

STRATFORD: Sept. 28.—Supplies and trade during the past week have been good. Quotations:—Cabbages, 2s. 6d. to 3s. 6d.; Cauliflowers, 2s. 6d. to 3s. 6d.; Turnips, 1s. 6d. to 2s.; Carrots, 1s. 6d. to 2s.; Potatoes, 2s. to 3s.; Apples, 2s. to 4s.; Pears, 2s. to 3s. 6d.; Walnuts, 3s. 6d. per bushel; Watercress, 6d. per dozen; Tomatoes, 1s. to 2s. per dozen lb.; Apples, cooking, 3s. to 5s. per bushel; Danmons, 1s. 6d. to 1s. 6d. per half-bushel; Plums, 1s. 6d. to 1s. 6d.; & Williams Peaches, 8s. to 9s. 6d.; Celery, 11s. to 12s. per dozen rolls.

POTATOS.

BOROUGH AND SPITALFIELDS: Sept. 28.—A slow demand prevailed, business being confined to best samples almost exclusively. Quotations:—Kent Regents, 7s. to 9s.; Essex, 4s. 5s. to 7s.; Hebrons, 7s. to 9s.; Early Kosé, 5s. to 7s.; & Magnum Bonum, 5s. to 8s. per ton.

COLUMBIA (East London): Sept. 29.—Beauty of Helton, 2s. to 3s.; Kent Regents, 7s. to 8s.; & Magnum Bonum, 5s. to 7s.; & Early Kosé, 5s. to 7s. per ton. STRATFORD: Sept. 28.—Magnum, best, 5s. 5s. to 7s.; seconds, 4s. 5s. to 6s.; Champions, 4s. 5s. to 6s.; & Regents, 6s. to 5s. 6d. per ton.

Imports.—The imports into London last week consisted of only 25 bags from Hamburg and 2 from Harlingen.

HAY.

WHITECHAPEL: Sept. 28.—There was a good supply of fodder, but only a dull demand, especially for Clover. Prices were as follows:—Clover, prime, 30s. to 107s.; inferior, 30s. to 85s.; hay, prime, 30s. to 50s.; inferior, 30s. to 65s.; and straw, 27s. to 30s. per load.

CUMBERLAND (Regent's Park): Sept. 28.—A good supply was on offer, but with a dull trade for meadow hay, lower prices being taken to effect a clearance. Quotations.—Clover, best, 95s. to 102s. 6d.; second, 75s. to 80s.; hay, best, 84s. to 86s.; second, 70s. to 80s.; and straw, 30s. to 37s. per load.

STRATFORD: Sept. 28.—Hay, 80s. to 110s.; Clover, 60s. to 110s.; and straw, 30s. to 35s. per load.

Government Stock.—Consols closed on Monday at the final figures of the previous Saturday—viz., 101 1/2 for delivery, and 101 1/4, to 100 1/4 for the account. The final quotations of Tuesday and Wednesday were 101 to 101 1/4; for both delivery and the account. The closing record on Thursday was 100 3/4 to 101 for delivery, and 100 3/4 to 101 1/4 for the account.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq. The Rydes, Alcester Lodge. 'Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work.'

THOMAS GREEN & SON, LIMITED,

Smithfield Iron Works, Leeds, and Surrey Works, Blackfriars Road, London, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their

PATENT WROUGHT-IRON MUNICIPAL OR ANGULAR CHAMBERED AND TUBULAR HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the easiest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE, a SILVER MEDAL, at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881

— FRONT ELEVATION —

The longitudinal section gives a view of the fire-box, water space, flues, &c. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

— LONGITUDINAL SECTION —

TESTIMONIAL.

MESSRS. THOS. GREEN & SON, LTD., NORTH ST., LEEDS.

Re HEATING APPARATUS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four stories high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1/2 in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical to the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably. I am, Gentlemen, yours truly,

Borough Engineer's Office, Municipal Building, Leeds, January 9, 1886.

THOS. HEWSON, Borough Engineer.

Waddesdon, No. 100. Bona F. DE ROTHSCHILD'S, and Evington, Miss ALICE DE ROTHSCHILD'S—together the most extensive and successfully planted places in the history of England—were supplied principally from the Knapp Hill Nursery. Young plants are sent to assist the plants growing;—no one interested in such matters will regret the trouble. Catalogues made but a very inadequate one of such a stock.

A DESCRIPTIVE CATALOGUE will be sent on application. Knapp Hill Nursery, Woking, Surrey.

THE Gardeners' Chronicle. SATURDAY, OCTOBER 9, 1886.

FROM AN IRISH GARDEN—A RETROSPECT.

JULY 14.—In these days of fiery sunshine white flowers in the garden are very welcome, they seem so fresh and cool when all around is hot and dry. Especially so is the old Campanula persicifolia, not planted in dots or martyred by being tied to a stake, but growing in a wide mass that somehow makes one think of a ship's white sail spread to the wind. White Pinks (Mrs. Sinkin) are very sweet and fair—large and beautiful, like a snowball, but the old-fashioned smaller kind has a soft feathery aspect that pleases unconsciously, while its fragrance is like the breeze from some spicy isle. To-day the long plumes of Spiraea filipendula fl.-pl., rising up from their nest of Fern-like leaves, are moving gently in the wind, and the white Rose of Provence is weighed down with its wealth of blossoms. One has to raise the flowers to see how exquisite is their purity, the petals being of such delicate texture that they give the idea of translucency. Nicotiana affinis, that looks so dusky in the full daylight with its blossoms tightly shut up like a little hand in a brown glove, will open out towards sunset; and through the twilight and such darkness as a summer's night may bring, gleam forth in starry brightness while other blossoms can barely be distinguished. This starry aspect is greatly enhanced by a dark background, and to see the scattered branches with hundreds of blossoms open against a deep green hedge of Escallonia macrantha is a picture in the gloaming. At last I have found where the Orange Lilies look best. It is just in the front of the dark grey wall where the stones are large, and when wet after a shower are exactly the colour of a thunder-cloud, having even the purplish tinge of a lurid sky. Against this deep background the strong warm colour of the Lilies is delightful. They do not look like Orange Lilies any longer, they have the glow of Fire Lilies, and with a cluster of white Marguerites at their base, and the feathery wands of Spiraea Aruncus close by, and dark-leaved Jessamine climbing over part of the wall, this spot is at present the most attractive in the garden. July 17.—After long days of burning drought and sunshine, soft rain has come and birds and blossoms alike are rejoicing in the delicious bath. Looking out early this morning I perceived the old Arbutus tree beneath all astrig with a crowd of blackbirds. As there were no ripe berries to be devoured I stood still to see what the eager fuss was about. I could not for a few seconds discover what the fluttering on the top of the thick tuft of green leaves meant; but suddenly I saw it all. They were taking a bath in the tree! So long deprived of moisture, they had flown at once to the old Arbutus,

whose thick foliage held the raindrops, and there, with outspread, fluttering wings, were busy dashing the warm rain-spray over their feathers. No doubt others have noticed this sight before, but as it was new and delightful to me, I remained to watch until, at some signal of their own, away they all flew to the garden to breakfast on Strawberries.

August 25.—Again the robin sings! There is no mistaking that plaintive autumn note, that tells us the summer is gone. The black-bird is singing too, not with spring's early song of hope, but as if recalling the joys gone by. The hill is wrapped in its royal mantle, the blue sky itself looking grey where the deep purple Heather leans against it. There are golden fronds showing among the dark green Bracken, and the new growth of the Gorse is of a lovely blue-green. As rain clouds pass and gather, the sea is purple in their shadow, and in the sun's rays gleaming with the indescribable light that is seen in an opal. While sea and land are alike so rich in colour, what a little spot the garden seems! And yet, when wintry storms again shall sweep the hill, it is to this little spot we shall turn for comfort. It is this little spot that will cheer and light us through many a darksome hour.

Just now the Japanese Roses are at their best, and seen in the morning sunshine nothing can well be prettier than the clusters of large crimson berries, shining among the glossy foliage with wide-open blossoms and bunches of ruby buds breaking through the berried branches. The hardness and vigorous growth of this Rose makes its culture the simplest. Each summer it sends up new branches, which are cut back in February to 6 inches or so, every bud of which in turn shoots up strongly some 4 or 5 feet high, covered with blossoms and fruit from early summer until the first frosts of October turn the whole bush to amber and crimson, as beautiful when passing away as in its May-day freshness. The white variety does not appear quite so vigorous, but is more beautiful; the berries no longer crimson, but of a ruddy orange, remind one of the little Mandarin Oranges one gets at Malta, and clustered among the glistening milky-white blossoms are charming.

The Japanese in their paintings make free use of this most picturesque shrub. Happening to show the crimson Ramana Rose to a decorative artist some days ago, he was silent for a few seconds, then exclaimed, "Now, I understand it all," and went on to say he had been that morning examining a beautiful Japanese screen, but [unheeding the leaves] felt completely puzzled to know why they drew their Apples with blossoms on the same branch! Now he recognised the large fruit of the Rose in what he had mistaken for Apples, and carried away a branch to design from.

The Japan Knotweed, *Polygonum sachalinense*, set in the grassy lawn, has tossed its wide branches around and sending up a lacy spray of flowers from the base of each leaf, looks as if a white veil of blossoms had been cast over the branches. Some of the large leaves are changing to a golden hue, and the lower ones have fallen off through drought, leaving the quaint cane-like stems visible beneath.

This year the Apples are not half so rosy as usual, but there is one tree that is very pretty even without the crimson touch; Golden Pippin, with sprays of deep purple Clematis, wandering through the branches. The growth of the Clematis is so fragile that it in no way interferes with or shades the ripening fruit, and the unpruned branches just give the needful support, while the Clematis follow its own will. The Austrian *Convolvulus* has in like manner climbed over an old Pear tree, but it is too self-asserting for any fruit tree of value, as it com-

pletely clothes and enwraps it with a tangle of leaves and blossoms.

The draughty porch is not a pleasant place at any time for flowers, but *Campanula pyramidalis* seems quite indifferent to the position. Two plants of the white variety have been pillars of blossom in it for the last month, and will still remain covered with bloom for weeks to come, as by clipping away the blossoms every few days when they wither, the stems remain fresh and fair, new flowers replacing those that have faded. A plant of this *Campanula*, bearing three or four stems 8 feet high, clothed with snowy flowers from top to bottom, is hardly recognisable as the same when grown in the open air, where comparatively few blossoms are expanded at the one time. At all events, when serving as tall guardians of the threshold their greeting to visitors is a very welcome one. L. A. L.

THE KINVER SEED AND FLOWER FARMS.

EFFECTS OF HYBRIDISATION ON GARDEN PLANTS.

Messrs. WEBB & SONS, of Wordsley, Stourbridge, stand high among the great seedsmen of the present time, and in point of usefulness, as growers of cereals and especially as breeders, or selectors and distributors, of improved varieties of Wheat, Barley, Oats, and Peas. Messrs. Webb devote their great farm of 1600 acres to the improvement of the plants of the farm and garden, carrying into the agricultural department the practice of the same arts which in horticulture have transfigured our gardens and wonderfully altered both flowers and vegetables. If any young gardener has not particularly considered the new gab of modern flowers, and the far more homely appearance of the flowers of old gardens, let him compare the small *Fuchsia coccinea* with the magnificent blossoms of the hybrid sorts, which are never far to seek, and which are tenfold the size of their parents, and much more brilliant both in flower and leaf. Modern *Antirrhinum*, Sweet Williams, Asters, Pansies, Stocks, and almost every other hardy flower, as we saw them growing in great beauty and perfection in the department devoted to flowers at Kinver, bear no comparison to their old types. Is it possible to imagine a greater change than that which has overtaken the *Tropaeolum* since it became a florist's flower? We might add, without forgetting Messrs. Webb's improved cereals, is it possible to imagine a less change than that which (speaking generally) Wheat, Barley, or Oats have undergone? The same metamorphosis which we recognise in flowers has occurred in the case of numerous vegetables, such as Peas, Potatoes, Tomatoes, Carrots, and the Cabbage tribe, including Cauliflowers; they have all been modified and moulded at the improver's will, with immense advantage to growers and consumers. On the one hand the skill of experts has effected wonders; on the other, that is, in agriculture, comparatively few efforts have been as yet recorded for the improvement of the plants of the farm.

IMPROVEMENT OF THE PLANTS OF THE FARM.

Messrs. Webb, however, have for years past laboured to remove this blot, and the appearance of the crops at Kinver, both corn and flower crops, bespeaks a brilliant success. We shall mention the former first in a few words of admiration. We had seen at Wordsley an enormous new five-floored warehouse, built two years since for seed corn alone, and said to be the largest building in the kingdom devoted to such a purpose. On the open ridge of sound soil at Kinver—an admirable site for the production of seed corn—we had the opportunity of inspecting, not for the first time, the corn crops, which are accommodated, when necessary, in the big stores, and which feed a rapidly increasing business in seed corn.

WHEAT.

The area of Wheat is 155 acres, comprising the Kinver Giant, a very popular and productive sort, selected some years since; the Challenge white Wheat, another prize winner, widely appreciated on the white Wheat soils; Square Head, a selected strain of a wide-spread variety; Golden Drop, Hardcastle White,

and Rough Chaff. Last, not least, except in the small existing stock of it, Hybrid King ought to be introduced with pomp and ceremony. It is a cross-bred Wheat of three years since. I must not pause to supply the pedigree of this august variety; it is very early, and will be harvested in August usually; I will only say that the monarch is most promising.

BARLEY, &c.

The extent of seed Barley is 206 acres, of Oats 168 acres, and of Peas 82 acres; but the sale of Peas is so large in the green-Pea growing districts of Worcestershire and adjacent counties, that a very large quantity of Peas is raised for Messrs. Webb every year, by farmers on suitable soils elsewhere.

The whole of the seeds and seed corn sent out by the firm are either grown by them on their own land, or grown specially for them elsewhere, by careful farmers, from "stock" seeds raised at Kinver, the crops in all such cases being properly "rogued" by qualified experts and their assistants, so that the breed may be kept perfectly pure.

PEAS.

The trials of Peas in the grounds at Kinver this year, included 140 sorts, amongst which are Chancellor, Wordsley Wonder, Kinver Gem, Electric Light, and many others. Every thing here is tried, tested and compared in near neighbourhood, cereal against cereal, according to the kind, root against root, and flower against flower. The competitive examination is most severe, and indeed cruel, since it occasions the destruction of many a plant in each department, which has failed to attain more than a moderate degree of excellence, instead of the pre-eminence which is required of all before they are catalogued and offered to the public.

With these remarks I must now dismiss all the agricultural crops at Kinver, cereals, "roots," pulse, Cabbages, and grasses for permanent and temporary pastures. I must reluctantly abstain, too, from more than incidental mention of Tobacco, which is here grown in twenty kinds, including all the best varieties that are cultivated in America.

FLOWER RAISING.

I have often endeavoured to describe a flower garden, and always with such ill success compared with my desires that I will not mar in that way the beautiful plots at Kinver. In the floral department the eyes grow tired among the numerous beds of blossoming annuals, including 250 sorts, and a large bed of each. The brightness of the flowers and the uniformity of each mass of colours are surprising. The fixity of the type of each variety is proved by the fact that many flowers, such as Pansies, which could formerly be reproduced true only from cuttings or by division, now yield seed which a gardener may thoroughly rely upon.

Among the flowers a few names of some of the most charming specimens can alone be given, such as these:—Brilliant *Petunia*, Carnations, and *Picotees*; several new varieties of *Mimulus*, giant and dwarf *Mignonette*, a gigantic *Sunflower* used as a screen and to feet high; Exhibition, double *Zinnia*, gold-striped French *Marigold*; Premier, single *Dahlia*; Asters of varied colours and sections, miniature, quilled, *Victoria*, and *Chrysanthemum*-flowered; many Stocks, and new Sweet Williams—and what flower at the price is better worth pondering over than the Sweet William for its peculiar beauty, which has been greatly increased in the best new varieties. Where shall this list end? I must just name, first, Challenge *Antirrhinum*, Canary Bird Wallflower, and show and fancy Pansies.

The various garden vegetables are well attended to here, but I had only a day for Kinver, and I have found by experience that a careful examination of the trial plots of one vegetable only—Lettuce, Carrot, Turnip, or any other, the plots being numerous—takes several hours; I cannot, therefore, venture to discuss the merit of Messrs. Webb's vegetables, but I would willingly take them on trust nevertheless.

In the various catalogues devoted to flowers, bulbs, seed corn, farm seeds, and special manures manufactured by the firm, and in the treatise on the formation of permanent pastures issued by them, an immense amount of reliable information is collected. Details, which want of space forbids my inserting here, will be found in these publications, with much good advice as to mixtures of manures, and the character of varieties as tested by wide experience. H. Z.

ON THE PROPOSAL TO ESTABLISH A PERMANENT COLONIAL MUSEUM IN LONDON.

The proposal to continue the present Colonial and Indian Exhibition at South Kensington having met with a good deal of support, it is worth while to examine it on its merits, quite apart from the popular accessories of music, illuminations, &c., the continued existence of which depends upon altogether different considerations.

The first point for examination is whether such a permanent exhibition or museum would materially and usefully supplement or form a real addition to the existing public institutions of London, for upon the determination of this question the decision ought largely to depend.

On a general review of the vast collection of objects exhibited in the present Exhibition, they are seen to be mainly included under the four following categories:—

- (1) Natural history objects, or specimens of the animal, vegetable, and mineral kingdoms of Nature.
- (2) The raw products derived from them, and their economic applications.
- (3) Art of every description, with which may be included objects bearing upon archeology and ethnology.
- (4) Manufactures of all kinds.

1. With reference to natural history, it can scarcely be a public desideratum to attempt to form a new museum of this kind when there exists, within a few hundred yards of the Exhibition, the finest collection in the world in the great national Museum of Natural History. There the animals, plants, fossils, and minerals, not only of the British colonies but of the whole known world, are exhibited with a fullness and in a manner that there could not be a possibility of in any way approaching.

2. Then as regards the economic uses of the vegetable kingdom at least—such as food-products, drugs, timbers, &c.—the nation possesses in the Museum of Kew Gardens a probably unrivalled public collection, admirably exhibited. Many years of energy and a very large expenditure of time and money would fail to make up again such a collection as this has now become.

3. Objects of art both ancient and modern form a very striking and important portion of the Exhibition. It is probable, however, that the best part of those which are not on loan have been sold or otherwise disposed of, and thus are not available for future exhibition. But with the South Kensington Museum at our doors the initiation of a new art collection cannot be needed; whilst as for objects illustrative of ethnology and archeological specimens, they are, it is needless to say, magnificently displayed in the galleries of the old British Museum in Bloomsbury.

4. There remains only the commercial products and manufactures of the colonies and India, and so far as I am aware, there exists at present no general public collection of such articles. Here, then, it appears to me, we have a reasonable basis for the formation of a permanent museum. A public collection of trade samples is a real want in London.

It appears, then, from the above observations, that no necessity exists for a new general museum of colonial and Indian productions, inasmuch as the public is already amply provided with other museums which illustrate fully nearly all the objects and articles proposed to be exhibited in the new one.

There is also good reason to think that the multiplication of museums is undesirable as well as unnecessary. We are not without experience of this, and the history of the late Indian Museum is quite to the point. The vast collections brought together by the Honourable East India Company were quite similar in kind to those it is now proposed to form, and illustrated very thoroughly the productions of India. But the Museum never attracted public interest or proved of much practical utility; many departments were neglected, the specimens badly conserved, and not available for consultation or study, and at last, its condition having become somewhat of an official scandal, it was, six or seven years ago, broken up and dispersed. It bears strongly on the remarks above made that the collections had to be distributed among the very museums which I have there enumerated. No doubt additions of much value thus accrued to them; but there was also an immense mass of duplicate and damaged material, some of which, at least, was destroyed. After this

experience it seems scarcely credible that a proposal to form again another general Indian Museum in London will be seriously entertained, whatever may be the case as regards the colonies. But in the latter, as in the former, it is almost certain that from similar causes a few years would witness the same history and a similar termination.

It is then, I believe, in a permanent museum of trade samples and of the commercial products of our colonies that a really useful outcome of the present Exhibition is to be sought. The precise scope and character of such a museum would, of course, require careful consideration; but there is a great and increasing want of some central emporium of a public character where authentic samples, accurately determined and labelled, can be readily inspected and examined by those interested in commercial pursuits. The collection might well be arranged geographically, and should be accompanied by maps, trade statistics, and other aids to inquiry. Under able management such a museum would be capable of rendering great service to the commerce of the Empire, and be the means of bringing into trade the numerous neglected products of the world. I may add, parenthetically, that it would also relieve the staffs of our chief scientific establishments of a good deal of work, involving often much sacrifice of time, which now falls upon them, though outside the scope of their duties.

The situation of such a museum should, however, be readily accessible to business men, and would be preferably in or close to the City rather than in the West End of London. *Henry Trimen, in "Nature."*

FLOWER SHOWS AND THEIR USES.

FLOWER shows, it must be admitted, are becoming to many lovers of a garden, and especially to such as are directly responsible for their management, a weariness of the flesh. There is so much anxiety involved with reference to subscriptions, furnishing the stages, the weather, and securing a good attendance on the exhibition day, that even their most sanguine supporters begin to ask themselves the homely but pertinent question—"Is the game worth the candle?" Considering the importance of the question, however, and the opportunities for usefulness afforded by an exhibition, the problem should rather be that suggested in the columns of the *Gardener's Chronicle*—"In what way can flower shows be made of greater use in the interests of horticulture, or rather the interests of the entire community?" The Temple of Flora is haunted by enthusiasts, as all must know; but there are others besides the enthusiasts to be considered, and especially the large middle class of tradesmen, shopkeepers, and clerks, to whom gardens and the cultivation of flowers offer just the healthful, interesting, and enjoyable recreation most suited to their circumstances and needs. In by far the greater number of provincial societies, however, the amateur class, which mainly consists of the foregoing, is far outnumbered both by the gardeners and the cottagers. Those who can best afford both the leisure to cultivate gardens and the means to furnish them—who should be the life and backbone of such societies—have no part in them, the question will naturally arise, Why is this? The answer we venture to give is "from ignorance," and this ignorance arises from the lack of opportunity for learning. In what way can the flower show assist? Careful and explicit labelling may help those who already know something of gardening, but far more useful and effective would be a series of lectures given at frequent intervals in the exhibition itself, attention being chiefly directed to the most easily cultivated and eligible classes of plants, discussing in plain language their structure, propagation and treatment. In most committees there are members well qualified for such a pleasant and useful work who would willingly volunteer their services for the purpose.

It is a treat to most people to walk round a well unfinished, neatly ordered garden; and it is scarcely necessary to remark that the interest and delight experienced are greatly enhanced—chaste and beautiful as the flowers themselves may be—by the description and explanatory remarks of the owner. The visitor pauses to admire an *Auricula*, for instance, and the grower points to it with pardonable pride as one of his own raising, gives its parentage and history, relates its hairbreadth escapes from scorching sunshine, frost, drenching rain, or the attacks of slugs, woodlice, or

aphis; expatiating on the beauty of its even margin, the symmetry and delicacy of its zones of colour, the density and richness of its golden paste, or the powdered silver overspreading its leaves. The little plant has almost a human interest attaching to it, and its growth and development are watched with the care and attention that the mother gives her child. Perhaps a result of the visit is, that the admiring amateur becomes a disciple, and in time a florist himself. The kind of interest elicited under such circumstances is entirely wanting in an exhibition. But there is also room for improvement in the selection and arrangement of the material of flower shows. As a rule, the specimens are "staged" in straight lines or formal groups, and crowded together, so that it is next to impossible to see the *contour* and habit of an individual plant. This is more especially the case with the so-called groups, where as much as possible of foliage and flowers is huddled into a given area. Much of the interest of the large shows is sacrificed to the *coup d'œil*, which, however effective, cannot compensate for the lack of comfort of the plants themselves, or the convenience of the spectator in the endeavour to appreciate their individual and intrinsic excellence. This crowding together for effect, too, is an advantage to the slovenly gardener, in giving him an opportunity of hiding the worse side of his plants. Another defect in the management of the provincial shows, which has an injurious effect upon the *morale* of both exhibitors and visitors, is in allowing the presence of badly-grown plants, the object of the exhibitor being simply to obtain a prize, although he himself must know as well as others that his specimens are obviously unworthy of commendation even, and only secure a prize because there are no competitors. Much cannot reasonably be expected in an educational point of view from exhibitions which only remain open a few hours. They are horticulturally only the exponents of cultural skill. Without some description, however, of the processes employed they simply excite our wonder and admiration, and there is, consequently, a waste of time and opportunity much to be regretted. *T. W. Harris.*

The Rosery.

THE ROSES OF THE FUTURE.

THESE, as pointed out by "Wild Rose" (p. 296), will mostly be Teas or Roses of similar habit and character, that is, perpetual or successional blooming Roses in fact as well as in name. I hope "Wild Rose," whose authority is generally reliable, is correct in saying that the Tea Rose is becoming more hardy by being "worked on the seedling Brier," and in consequence of the greater vigour of the newer varieties. My experience of Lady Mary Fitzwilliam, one of this sort, and one of most vigorous of the new Teas, during the past winter, by no means bears this out. Out of about a dozen plants worked on the Brier and protected with a handful of bracken, in the same way as all others, only two escaped. Still, if the uses of the seedling Brier or any other stock, and the dwarfing of Teas, will make them harder, then indeed such an impetus will be given to their growth as will indefinitely extend their cultivation, since not a few of them are more hardy than is generally supposed. The *Gloire de Dijon* and *Homère*, for example may be pronounced as hardy as the majority of hybrid perpetuals. Neither is the absolute hardiness of the tops of Teas in bud of so much moment as many suppose. In warm situations dwarf Teas will pass through our ordinary months unimpaired, without protection or with a thin layer of dry Fern leaves or of boughs. Where they are not otherwise protected the stems and new branches should be earthed or littered up to a height of 6 or more inches. This preserves the citadel of life, and, should all the extremities beyond push into the front, the result is simply that you lose the chief part of the first bloom of your Teas, and provide your richest harvest from August till the end of the season. In gardens where many other Roses are grown this backwardness of the Tea Roses proves by no means an unmitigated evil. The first great harvest of perpetuals crowns June and July with Roses. Then the Teas follow, and with a few straggling perpetuals follow the year to the end with more or less bloom.

Both Roses may be vastly extended and richly supplemented by growing some of the choicer Teas

and Noisettes on walls. Such Roses as *Maréchal Niel*, *Celine Forestier*, *Triomphe de Rennes*, *Gloire de Dijon*, *Alba multiflora*, *Homère*, *Madame Van Houtte*, *Niphètes*, &c., bloom in the open on walls from May to November.

The culture of dwarf Teas as herbaceous bionials is simple in the extreme. Take care of the root-stocks in winter and the cold spring, and the summer will furnish them with tops, and the autumn clothe the latter with beauty and fragrance. Teas get used to being cut down by the frost and the knife, and seem so far to like it as to break with greater vigour in consequence, but the final cutting back should not take place till May. The tops are the natural and proper protection of the plants, often proving sufficient of themselves, and in any case adding greatly to the potency of all that may be added thereto. Besides, there is another powerful reason against the autumnal or early spring pruning of Tea Roses. Should they escape injury in winter they will prove the first Roses in the garden to bloom in the early summer; and, provided the flowering shoots are promptly cut back as the first blooms fade, the autumnal and successional blooming will not be greatly diminished. *D. T. F.*

ROSE M. ABBÉ GIRARDIN.

A friend sent me this as a new Rose to try about three years since. It failed to do well until this year, and I notice just now the autumn blooms seem if anything better than the summer. I cannot find it in any of my catalogues, and do not know who sent it out, or under what class. Though blooming now it has a decided Tea scent, and, when doing well, a delightful shape when opening, like *Niphètes*. The colour, too, is peculiar—a soft rose-purple, inclining to pink. Will some of your correspondents say what they think of it? Perhaps it has come under the notice of "Wild Rose." The constitution does not seem robust planted out. *W. J. Murphy, Connell.* [In the Rose List of Ketten Brothers, Luxembourg, this sort is classed as a Bourbon; growth strong, floriferous. Ed.]

TOBACCO CULTURE IN NORTH WALES.

KNOWING well that if any part of Great Britain more than another is adapted for the cultivation of Tobacco that part is the maritime districts of Wales, I therefore determined, both in the interests of science and agriculture, to test the matter in as thorough a manner as possible, compatible with the somewhat limited means at my command.

On June 16 of the present year, thanks to the courtesy of Messrs. Little & Ballantyne, of Carlisle, who sent me the plants, twelve kinds of Tobacco, several of each, including *acubifolia*, *Ohio*, *Engelmanni*, *Pietra*, *Maryland*, *Florida*, *Shiraz*, *Virginia*, *Latakia*, *virginiflora*, and *longifolia*, were planted in fairly rich soil in a somewhat sheltered portion of my garden. But first of all it may be well to state that Colonel Clarke's instructions, as given in the *Gardeners' Chronicle* of May 1, 1886, were, save in one point, carried out to the letter. The plants when sent me from the Carlisle nurseries were on an average half a foot in height, but stout and stocky, and were planted as follows on June 16. A piece of well-worked, well-manured soil was thrown up into low ridges almost similar to those which a farmer prepares on which to sow his Turnip seed, and the plants placed at 15 inches apart, instead of 3 feet as recommended by Colonel Clark, for I justly considered that, as we are subject to rather severe south-western gales in Carnarvonshire, the nearer the plants were placed consistently with the allowing of perfect development, the less chance would there be of injury to the leaves and stems; and right I was, for during some stiffish breezes I noticed that one plant acted admirably as a stay to the other.

Immediately after planting a spell of dry, sunny weather set in, and although the young plants were duly tended with water, still, for their sake, although not for some Oak bark that I well knew was not fully harvested on an adjoining estate, glad was I when a night of rain came to the rescue. Until this rain came, which was about a full fortnight after planting, the young seedlings made no progress and my spirits were rather damped in consequence; but the manner in which they started away after a dipping week was certainly pleasant to behold. The next bother, and the only one save, perhaps, in curing, was to keep the

shoots that were constantly forming in the leaf-axils nipped out, this being for nearly six weeks almost a daily task, for it seems to me that with these, like the herbaceous flowers grown by ordinary gardeners, it was "cut and come again." The removing of the flowers when just beginning to open was likewise duly attended to, but, I must add, somewhat reluctantly, for several of the kinds had heads of rather quaintly ornamental flowers, that could well hold their own when placed in an old china vase with the black and gold Kudbeckia. After being two months established the plants grew strong and rampant, some of the kinds having attained a height of nearly 5 feet, with oh! such big, broad leaves, about 20 by 12 inches, as the gardener said. When six weeks came round many of the lower leaves were turning of a golden hue, somewhat like those of the Lime tree in the autumn, and after another fortnight, on September 16, or exactly three months from the date of planting, the plants were pulled up to undergo the final process of curing, the leaves. When pulled up the roots were denuded of soil by a gentle shake, and the plants allowed to remain for about two hours in the sunshine, by which time the leaves became wilted or perfectly flaccid, which aided considerably in the next process, that of hanging up the plants. To do this a piece of cord was tied around the stem of each close to the root, and the plants suspended head downwards, on wires stretched along at about 10 feet from the ground. Fortunately a spell of such weather as alpine gardeners detest—east wind with dull sunshine—set in, and the plants were kept on the lines out-of-doors for ten days, or until September 27, by which time some of the lower leaves—those next the root—were becoming of a greenish yellow, but those towards the top of the stem remained almost unchanged in colour although the sap was fast drying out.

A falling glass and inky clouds hastened the ingathering of the plants to an airy shed, but previous to removing them from the lines the leaves were stripped from the stems, and afterwards carefully arranged on lines, by being bent double, under cover. Here they dried more quickly than out-of-doors, but this was, in my own opinion, simply owing to their being removed from the stems, for these latter were so large and fleshy that a great quantity of sap was stored up, which considerably retarded the drying of the leaves. The next process, that of packing, was engaged in from time to time as the leaves assumed the rich golden colour, but the method adopted was not exactly in accordance with that advocated by Colonel Clark. A wooden box was looked out, of sufficient size to hold the leaves, but it should not be too deep in the sides, else the putting on and removing of weights is troublesome, and which we found out from experience. In packing the leaves a dozen were placed a-top of each other, with the tips all one way, and tied with a thread at the other end: they were then placed in the box, layer on top of layer, and weighted heavily. Feared lest the leaves might contract mouldiness, and so injure the sample, the whole bottom of the box was not covered, but a space left of about 6 inches between the layers on each side, and which I believe has been productive of good, more particularly in leaves like those of the Tobacco, which are so hygroscopic. The box was placed in a dry room not far from the fire, and as a few more leaves became dry the weights were removed, the sample placed a-top of the last, and the weights again replaced.

When little more than a week under pressure a friend or two called one evening, and, of course, Tobacco culture was the text, the final results of which were that the Welsh grown "weed" must there and then be tried. A piece was therefore procured, and, indeed, the appearance of it as regards colour was excellent, quite as good as a few minutes afterwards we found the taste.

It is but fair to add, however, that the smoke was somewhat pungent, more so, at least, than the "Amlwch" and "Golden Cloud" smoked usually by my friends, and another peculiarity noticed by all was that the home-grown was slightly more narcotic in its effects than the foreign, but this we judged was due to the green state of the leaf as compared with the other. How it will ultimately turn out I know not, but from present looks I should say well, and will let you know a month later on.

In conclusion, I have not the least doubt, judging from my own experiments, that the culture of Tobacco in the British Isles is of the simplest description, the only thing I am frightened of is that the harvesting of the crop will be difficult in our sunless climate—unless, when compared with its native land—unless by the erection of light airy sheds in which to store and cure the leaves, for rain, after commencing the drying process, is ruinous to most samples.

This difficulty is, however, readily enough overcome, and if the ultimate weight of Tobacco procured from a given extent of ground be such as to fully compensate for trouble and ground rent, I have no doubt that, should Government duties not be too pressing, the cultivation of Tobacco in Great Britain will go on increasing, for, as prices go at present, the usual crops of our farmers are hardly worthy the expenses connected therewith. *A. D. Webster, Llandegai, Bangor*

New Garden Plants.

GONGORA FLAVEOLA, n. sp.*

THIS *Gongora* is near to *Gongora gratulabunda* and *G. pleiochroma*. It bears a rich raceme of distant flowers, which are light ochre-yellow; the lip darker, more yellow; column green. There are brown spots on the base of the long narrow median sepal, and on the petals, lip, and column. The peduncle is angulate, by no means compressed. It was grown and kindly presented to me by Mr. J. O'Brien, of Harrow-on-the-Hill. *H. G. Rehb. f.*

ARISTOLOCHIA SALPINX, *Mitt.*, n. sp. † (See fig. 92, p. 457.)

This is not quite so remarkable a species as that lately described by Mr. Brown, and is hardly likely to find favour as an exhibition plant. The leaves are cordate-ovate, lanceolate, subacuminata, glabrous on either side; the perianth is an inch or more in length, cream-coloured, with a network of purple veins, its tube is inflated at the base, then constricted, and abruptly bent back, expanding into a trumpet-shaped tube, the mouth of which is a little oblique, somewhat two-lipped, the lips compressed, so as nearly to close the tube, the upper lip the larger, with a yellow blotch and numerous purplish spots. The margin is slightly reflexed, marked with purple lines and a few short purple hairs. At the junction of the constricted with the dilated portion of the tube projects downwards a trowel-shaped process which, aided by the hairs on the sides of the tube, which also point downward, doubtless hinders the egress of insects from the flower as much as it favours their passage into it.

The staminal column is either four-lobed or five-lobed—an unusual circumstance in the section to which the plant belongs. The species comes near to the South Brazilian *A. triangularis* or *A. Sellowiana*, but differs in the leaves, and especially in the arrangement of the smallest veins, and in the fourfold division of the column, if, indeed, that prove constant. The species is a native of Paraguay, and has been named in allusion to the trumpet-shaped flower. *M. T. M.*

ROOTS. †

It is a fact which has become more and more evident to the practical cultivator that the results of his efforts manifest themselves on the whole in a sort of compromise between the plant and its environment: I mean that although he sees more or less distinctly what his plant should be according to a certain standard—it is but rarely, if ever, that the plant cultivated perfectly fulfils in every respect what is demanded of it. Of late years this has of course forced itself more prominently before the observer, because the facts and phenomena constituting what is termed variation have been so much more definitely described, and the questions arising out of them so much more clearly formulated.

* *Gongora flavola*, n. sp.—Aff. *Gongora gratulabunda*, Rehb. f., ungue aequaliter sigmoideo, hypochilii sinu supra-marginali amplo, angulo anteriori infra aristas medio (nec basilar) carinibus horizontalibus angulatis mucosis, epichilio humili, gutture in basi inferiori immixtissimo. *H. G. Rehb. f.*

† *Aristolochia (Gymnostichia) salpinx*, *Mitt.*, n. sp.—Volutis glabra: rami gracilibus, foliis distantibus, 13 x 7 cm., sinu lato separatis, nervis e pedatis dispositis, subtus prominenter, interstibus marginibus vix acutis, nervis minoribus pluribus approximatis, petalis 4, 4 cm. — Flore circa 25 mm. long. colore cremoreo vix reticulatis purpureis insignito, basi ventricoso, lobis superioribus repente resurgentibus, sessim in limbo lato transverse expansis, ad marginem revolutum lower bilobatis, tubo infero incurvo macula flava notato purpureoque maculato, tubo infero ad styli processu trifurciformi deorsum versus curvato; columna 3 mm. ovata apiculis apiculis antheris linearibus basin stylium attiguentibus. Ex *Asa. chin.*, Para 235y, hort. ex W. Bull adactis.

† A lecture by H. Marshall Ward, M.A., F.L.S., Fellow of Christ's College, Cambridge; Professor of Botany in the School of Forestry, Royal Indian College, Cooper's Hill.

Two points can be asserted without fear of contradiction; first, the plant itself is a variable organism; and, secondly, its environment varies. Now within limits which are somewhat wide, when closely examined, the experience of man leads him to neglect the variations occurring around him, and so no one quarrels with the statement that two individual *Geraniums* belong to the same variety, or two Oak trees to the same species, although an accurate description of each of the two *Geraniums* or of the two Oaks might require very different wording.

THE WATER-SUPPLY.

It has also become more and more evident that although we cannot ascribe all variations to their causes—very often, indeed, we cannot even suggest causes for them—there are nevertheless numerous deviations from the normal, so to speak, exhibited by plants which can be distinctly referred to certain

living. The experiment is easy and conclusive with such a weed as the above. Now it is just such experiments as that above described—some of them equally simple, others less so—that the physiologist devotes much of his attention to, and in just such a manner has been gathered together a nucleus of information around which more knowledge can be grouped.

I may make these points clearer by again quoting an illustration, and, not to confuse or mislead you by going too far afield, I will keep to the same line of investigation, partly because it is quite as simple and conclusive as any other of many that might be selected, and partly because it may be possible to set before you some facts which are interesting or even new to you.

HAIRS.

It has been found that in some cases where two plants are growing in the same soil and under the

hairy, whereas allied species growing in or near water, or even only in moister situations, are devoid of conspicuous hairs, or even quite smooth.

The above peculiarity is not confined to leaves and stems, moreover, for experiments with roots have shown that the root-hairs, which are so important in collecting moisture, &c., from the soil, can be made to appear in enormous numbers when the root is kept in a soil which is very open and only slightly moist, whereas none or very few are developed on the same roots growing in water: this again is in accordance generally with the fact that the roots of land-plants growing in light soils develop innumerable root-hairs, whereas those of water-plants do not thus increase their surface and points of attachment. I cannot here go into all the interesting facts known about these hairs, but it will be sufficient if you bear in mind the main points just mentioned.

DEFICIENCY OF WATER.

Let us now vary the experiments a little. It is obvious that we might suppose any number of differences in the amount of water given to the plants used in the experiments described above; but it would be found, as matter of fact, that however little be the quantity of water given to the soil in which the dwarfed plant is, compared with that put into the soil in which the luxuriant plant grows, the actual weight of water will nevertheless have to be considerable, taking the whole life of the plant into consideration—there will be more used than you probably know, moreover, because the soil itself will no doubt condense and absorb some from the atmosphere during the night. There is a minimum of water absolutely necessary, and if the plant does not obtain this it will die. Its death will be ushered in by drooping and withering of the leaves, stem, and roots, and this condition, in which the functions of the plant are interfered with beyond a certain point, passes into a condition of disease.

EXCESS OF WATER.

Now take another case. We might so arrange the experiment that we poured and continued to pour too much water into the soil. Here again it would be found that a condition of disease eventually sets in—i.e., a condition in which the functions of the plant are again interfered with beyond a certain point. The symptoms and progress of the disease will be very different in the latter case, however, from those in the former. It may also be mentioned that in neither experiment is death inevitable if the disturbing cause is removed soon enough—i.e., if sufficient water be added in the first case before the cells have ceased to be able to take it up, or if the previous conditions of the soil are restored soon enough in the case of the over-watered plant.

Here we come to a matter which is less simple than may appear at first sight. You will note that the problem in the latter case is to restore the previous conditions of the roots and soil soon enough; I put it thus, because the conditions of the roots and soil may soon be very profoundly altered by the over-watering.

To understand this, it is necessary to become a little more fully acquainted with the condition of affairs in what may be called the normal case, where the soil is light and open, and plenty of water, but not too much, is at the disposal of the roots. Such a soil will consist of innumerable fine particles, of different shapes, sizes, and composition. No doubt there will be grains of quartz, particles of broken up vegetable matter, and little rugged bits of stones containing various minerals; each of these tiny fragments will be covered with a thin layer of water, and you would probably be greatly surprised if I were to go into the proofs showing how extremely tenacious of its water-blanket each particle is. It may be enough for our present purpose if you accept the fact that it requires enormous force to deprive the particles of the last traces of their water-layers; they will give off some—or in some cases even a good deal—rather easily, and in fact when the layers become of a certain thickness no more water can attach itself to the particles, but it falls away, and the soil remains saturated, as we say.

AIR IN THE SOIL.

Now these particles of soil, each enveloped in its water-blanket, are not in close contact; there are spaces between them, and these interspaces influence the quantity of water which can be held back by the soil. Let us suppose such a soil perfectly dry; the particles above referred to being irregular in shape and size, and only roughly in contact at various points, the interspaces will be filled with air. If water be then added in some quantity, each of the particles becomes clothed with a layer of water, and some of the air is driven out, though bubbles of air will still exist in the larger interspaces.

(To be continued.)

*

FIG. 92.—ARISTOLOCHIA SALPINX: FLOWERS CREAM-COLOURED, WITH PURPLE VEINS: THROAT WITH A YELLOW BLOTCH SURROUNDED BY PURPLE SPOTS. (SEE P. 456.)

deviations from the normal on the part of their environment.

To illustrate this we may take the case of two plants of that very common weed, the Shepherd's Purse, growing at different ends of the same small plot of ground: the soil is sandy, and so much alike all over as to be regarded as the same everywhere, nevertheless the plant at one end is large, more than a foot high, and luxuriant, with many leaves and flowers, and eventually produces numerous seeds, whereas that at the other end is small, less than 4 inches high, and bears but a few stunted leaves and three or four poor flowers and fruits. The cause of the difference is found to be the different supply of water in the two cases; and if any one doubts that this may be so, let him try the experiment of growing two or more specimens of this weed in pots: the pots to be new, filled with soil which has been thoroughly mixed, and all the pots exposed to the same conditions—i.e., practically the same—except that those of one series are watered sufficiently often, and those of the other only just sufficient to keep the plant actually

same conditions as above, but where one plant receives less water than the other, that the dwarfed drier plant is more hairy than the larger and luxuriantly growing plant, which has been well watered. On looking more closely into this matter it turns out that the extra hairiness is (in some cases, at any rate) simply due to the fact that the hairs are closer together, because the little cells on the outer parts of the plant which grow out into hairs do not increase so much in length and superficial extent as those on the well-watered plant, and thus the hairs stand thicker together on the same superficial area of the organ—of a leaf, for instance. In other cases, however, the hairs are really increased in numbers and length—the plant is absolutely more hairy. It will be noticed that details concerning growth and turgidity, and of the influence of various minerals, and so on, are not under consideration here. I am not asserting that all cases of hairiness in plants are to be ascribed to this cause; but it does occur, as stated, and the point is a curious one in view of the fact that very many plants which grow in sandy dry soils are conspicuously

MY GARDEN AT FIUME.

BY THE ARCHDUKE JOSEPH.

OWING to the mild climate of this country very little attention has been paid to the acclimatisation of plants till lately, but my garden at Fiume affords a favourable site for carrying on such interesting experiments. In the most southerly part of Hungary, 45° 20' N. lat., 30—75 metres above the level of the sea, 700 metres in a direct line with the coast of the Quarnero, rising above the old citadel of Fiume, on the south declivity of Belvedere, is a rocky waste of Karst limestone, the fissures of which are composed of small pieces of lime mixed with impermeable red clay. In the neighbourhood there are vineyards and market gardens, in which Figs, Olives, Laurels, and Almonds grow. The lower part of my garden was made twenty or thirty years ago by Giovanni Ciotta, Mayor of Fiume, a great lover of plants who found at that time two examples of *Ficus pinea* about twenty or twenty-five years old. This old garden was 3 acres in extent, and surrounded the house. In it there were many exotics, such as *Chamærops excelsa*, *Cedrus*, *Cupressus*, &c. A wood of deciduous trees I cut down, and the space thus gained I devoted to exotic evergreen vegetation. The higher part of the garden is beneath the lowest terrace, and was mostly composed of rocks with very little grass, and a few miserable *Pistacia Terebinth*, *Oraus europæa*, *Celtis occidentalis*, *Corylus Avellana*, &c., and brake Ferns. It was 3½ acres in extent. In addition to these two plots I bought on the west side 4 acres and a house, the whole extent of the gardens at present comprising 9½ acres.

The climate is extraordinarily favourable. Fiume, taking the average of thirty years, has a mean of temperature of +14° C. (57° F.); maximum, +35° C. (95° F.); minimum, +9° C. (49° F.); January, +5° C. (42° F.); July, +24° C. (76° F.). The lowest temperature (—7° C. = 20° F.) observed in several localities has been observed only once in ten or twelve years. From these observations I assume that my garden lies in the isotherm of +15° C. (59° F.). This isotherm of +15° from east to west in the northern latitude runs through Japan, 36° N.; China, 34°—37° N.; Persia, 38°—39° N.; Caspian Sea, 49° N.; Asia, 40°—42° N.; Turkey, 43°—45° N.; Fiume, in the Quarnero, 45° 20' N.; Italy, 45° N.; France and Spain, 44°—43° N. Corresponding with these in the southern latitudes are:—New Zealand, 34° S.; Australia, 33°—34° S.; America, 40°—30° S.

All the plants that grow naturally within these isotherms are hardy in the open air in the region of Fiume, as frost is very rare, and when it does occur, it lasts only a few hours, so that plants may be induced to grow here transplanted from mountains as well as from warmer climates. Mountains of from 1000 to 2000 metres in height surround my garden from W. to N. and N.E., the only low-lying spot being the valley of Fiumara, so that the force of the Bora is a little checked in its passage, although felt in the most northern part of my garden. The Bora is very cold, but frosts occasioned by it occur very seldom. The Tramontana is a north wind which causes frosts, but owing to the protecting mountains its effects are not felt in my garden. At such times hoar frost is seen in fields, and also a very thin sheeting of ice on shallow pieces of water, but the earth is not frozen more than 1 centimetre below the surface, and even then only for a few hours. Towards the east are the Dalmatian mountains, and towards the South are the islands of Veglia and Cherso, subject to violent storms. They are a good distance away, but the air is made colder by them. My garden from morning till evening is exposed to the rays of the sun, which even in winter are powerful. The spring begins sometimes in the middle of January, but, generally speaking, the Almonds do not bloom till the latter part of February.

Before I commenced the cultivation of my garden I ascertained from Isidor Wauchig, engineer of Fiume, the existence of a powerful subterranean spring. I sunk a well in the white limestone, which is nearly as hard as marble, and the depth of which is 17 metres, and the width 3 metres; over this well I constructed a forcing and sucking-pump, worked by a gas-engine of 8-horse power. This raises the water through large iron pipes, which conduct it into two large reservoirs made in the rock, and situated in the highest part of my garden. In these two reservoirs is a network of iron tubes which extend over all the garden, and with natural pressure distribute the water into thirty-two hydrants. By this means

I preserve the life of the plants in the dry hot season and on the rocky ground. I have procured from Lapacio a quantity of heath-mould, and from the Chestnut woods of Lovrano Chestnut manure and mould.

For the accommodation of the plants I have had walls made, on which I have placed mould, and also pits and ditches, which I have hollowed out with gunpowder and dynamite. Stones for the walls were plentiful, and the contractor who made the dockyard of Fiume obtained for me from there 17,000 to 20,000 loads, as the place where the stones are ordinarily procured is at some distance from Fiume. This was a great undertaking, but I have been well rewarded for all the trouble. The tender plants of warmer countries I planted under the shelter of the walls and the rocks, also the taller Firs and the Bay Laurels, which are thus sheltered from the east and north winds, and which have all the heat of the afternoon sun.

Near the Hungarian sea-coast Palms grow, and there is a small piece of land where one might imagine the climate subtropical. I obtained my plants by sea through the Hungarian Marine Adria Society:—1. Palms, Cycads, Ferns, Orchids, from the Compagnie Coteorientale d'Horticulture, Ghent, Belgium; and 2. *C. Creswell*, George Street, Sydney, Australia. 2. Conifers, Pines, evergreen trees and shrubs, from Louis Leroy, Au Grand Jardin, Route de Paris, Angers. These last were shipped at Bordeaux.

Accompanying the Archduke's paper is a list of plants too long for us to give at length. We may add that it comprises *Chamærops excelsa*, *C. Fortunei*, *C. humilis*, *Phoenix dactylifera*, *P. tenuis*, *Cereus peruvianus*, several species of *Opuntia*, and *Acacia*, *Aspidistra elatior*, *Coccolus laurifolius*, *L. phedra altissima*, *Eucalyptus globulus*, *E. robusta*, *E. bicifolia*, *Ficus repens*, *Myrtles*, *Oleanders*, *Olives*, *Pomegranates*, *Physianthus albus*, *Plumbago Liriodendron*, &c. In the spring of the present year numerous Palms, Cycads, and Tree Ferns, have also been planted out, the results of which will be looked forward to with great interest.

These particulars are taken from a paper, in the Hungarian language, contributed by the Archduke to the *Ma-yar Nemzetnyi Lapok*, the Hungarian *Journal of Botany*, and kindly communicated to us by Professor Kanizs of Clausenburg.

Orchid Notes and gleanings.

CHIRRIOPETALUM PULCHRUM.

MR. N. E. BROWN describes in the *Illustration Horticole*, t. 608, a new species of this genus with creeping rhizome, ovoid 1-leaved bulbs, and erect umbellate racemes. The flowers measure 1½ inch in greatest length, their general outline is linear oblong, the colour yellow with purple spots. The upper sepal is short, rounded, and provided with a long slender terminal thread. The two lateral sepals are united together and bent downwards so as to form a flat oblong blade corresponding to the two lower sepals in *Cypripedium*. The petals and lip are both small.

ONCIDIUM MACRANTHUM, Lindl.

MR. E. HARVEY, Riverdale Road, Aigburth, Liverpool, sends me flowers of an individual that shows a certain tendency to approach a fine form of *O. Williamsonianum*. There is an Indian-purple stripe on the stalks of the petals, and their disc is marked with brown blotches. *H. G. Ribb. f.*

EPIDENDRUM MATHEWSII.

Six species belonging to this type inhabit the Andes of Central and South America, and belong to the Name group of the section *Epidendrum*. The species under notice recalls the appearance of *Lindleyi* *Naudes discolor*, the type of that genus as founded by him. Horticulturally the plants are very distinct from the general run of cultivated *Epidendrums*; and *E. Mathewii*, although incomparable to the remarkable and peculiarly coloured *E. Meduse*, is in reality a floral gem, and superior to *E. discolor*, although similar in habit and size. The rigid fleshy leaves are more or less irregularly stained with purple, and are arranged in a two-ranked series, closely clothing the short procumbent or diffuse stems with their sheathing bases. The sepals and petals are small and almost transparent, but stained with purple externally, which shines or appears diffused through

them. The internal ones are connate for about half their length, and seem to perform no other function than that of supporting the labellum by which they are completely concealed. The latter is orbicular, and bilid, strongly convex above and concave beneath, of a deep shining dull blood-purple colour, and by far the most conspicuous organ of the flower. In this respect it excels that of *E. discolor*. The plant requires warm treatment, and to be hung up near the glass fastened to a block, with a little sphagnum to retain the moisture, or, better still, on a piece of Tree Fern stem, that readily retains the moisture necessary for its welfare. Of several specimens at Kew one is flowering in the East Indian-house.

NURSERY NOTES.

MR. C. WOOD'S, ROUEN.—Mr. Wood's nursery is not an emporium for new or rare plants, it is a market nursery where only well known and reliable subjects, such as find ready sale at the Rouen market, are grown. The whole extent is about 2 hectares (5 acres), and it contains 10,000 square yards of glass. Three lean-to houses are devoted to *Camellias* for cutting, several varieties are grown, but mostly *alba plena* a great quantity of these is required for the different fairs, &c., of the churches, for, as is well known, Rouen is greatly blessed in that respect. For cut flowers large numbers of *Stocks*, *Primulas*, *Cyclamens*, &c., are grown; and also *Roses*, the favourite being *Gloire de Dijon*, still other sorts are much sought after. It is singular how free from mildew this *Rose* is in comparison with the *H.P.'s* growing near by, which are positively grey with the fungus. A few of the old sorts of *Dahlia*s, such as were in fashion when the late Mr. Wood (father of the present) started his nursery, on leaving what is now the *Jardin des Plantes* (see *Gardener's Chronicle*, p. 425). There is a great interest attached to them, these being the first plants cultivated by him for trade purposes. But they have not been kept up to the time, because after a few years they were attacked by a troublesome and destructive grub, which nearly exterminated them. Although the cut flower trade is large it is not to be compared to the demand for pot plants, the customers seeming to prefer the plant in a pot—so that they may attend to its wants daily—to the mere decoration of their apartments with the cut blooms, so soon to fade. Neither do the French gentlemen, generally speaking, adorn their persons with buttonholes, except on very grand occasions. Of the ladies I will not speak.

The most extensively grown plants are Indian *Azaleas*, for which there is a great demand about Christmas time. Mr. Wood grows them admirably, his fine sturdy plants being real pictures, whether in or out of bloom. About 20,000 *Azaleas* are grown here each year, and nearly all are disposed of at the local market. Sometimes, however, a small trade is done with the English nurserymen. The Belgian system of cultivating *Azaleas* is adopted by Mr. Wood, the soil found in the forest lands which abound in the district having been found most suitable for their culture. Heaths which are grown in the open ground should be mentioned as coming second to the *Azaleas* as regards quantity, as many as 10,000 plants being the stock: concerning quality there is no difference. In connection with these plants there is a peculiar fact: Mr. Wood had attempted to grow *Heaths* on his ground as it was a few years ago, but failed. An adjoining plot of land was taken by Mr. Wood, and he once more tried *Ericas*, and with such success that he has continued to grow them ever since in increasing quantities. The differences between the situation and exposure of the two plots are to be held accountable for this. The varieties cultivated are such as may be seen on the London market, and include *hyemalis*, *Wilmoreana*, *gracilis*, *ventricosa*, and others. Particularly fine also are tuberous *Epigonias*; only one colour, a brilliant and deep rose-red, is grown. These plants are balls of bloom—one might almost say of fire—being only about 1 foot in height; this dwarfness is owing to the cold weather in the early part of the year soon after being planted out, when their growth—upwards, at all events—was checked. The individual flowers are very large, measuring on an average some 5 or 6 inches across. Other outdoor plants include *Chrysanthemums*, which are largely grown for cut flowers as well as for pot plants, and *Bouvardias*, always favourites, and justly so, for like purposes; *Bouvardia Humboldtii* grandiflora is the only variety grown, as there is no demand for the red flowers.

Let us now look inside the houses. First of all to be noticed is the mode of heating. Mr. Wood manages this all-important part of his work in a novel manner. This is how it is done:—On the opposite side of the road is an establishment where much weaving is done—all by machinery. The hot-water produced by the machines at work here is run out as waste, but is not wasted, for Mr. Wood leads it through pipes into his nursery, where it is utilised for heating his pits and houses—an economical manner of heating, and not a bad one; I recommend it to any horticulturist similarly situated.

Of the plants in the houses I may sum them all up as well done. Very large numbers of Bromeliads and allied plants are cultivated, an entire house being devoted to them. In France these plants are much more admired than in England. When I saw this house its beauty greatly struck me; on both sides the stages were full of the Bromeliads, several of which were in flower, the red colour of the usually green parts of these plants and also of those just about to flower being very telling in effect: to improve all this was a splendid plant of *Stephanotis floribunda* trailed along the roof and heavily laden with flowers. Very greatly in demand on the market are *Gloxinias*, of which the brilliantly coloured varieties of all sorts are extensively grown. A number of fine dwarf *Orange trees*, from 1 to 1½ foot in height, masses of blossom, are also to be noted. *Ficus elastica* is also largely grown, its foliage being of that fine bronzy hue which is so much admired.

Amongst other plants largely grown the chief are grafted *Epiphyllums*, which attain their perfection during the winter months, and are of course most useful then: one entire house is devoted to them. There are also Ferns of various species—*Adiantums*, *Pteris tremula*, and *Lomarias*, chiefly; Palms, of sorts, particularly *Phoenix reclinata*, and *P. tenuis*; many varieties of *Draacena*, *Pandanus utilis* and show *Pelargoniums*, which are forced for sale during the spring and constitute the most important feature during that time of the year. *Le Voyageur*.

Gloxists' Flowers.

CHOICE TULIPS.

ONE assuring feature in relation to the last exhibition of Tulips at Manchester was the number of exhibitors that took part in the competition, and yet such exhibitors as Mr. William Whittaker, of Salford; Mr. Thomas Haynes, of Warwick, and others, were not able to put in appearance. When as many as eight stands of twelve dissimilar Tulips are exhibited in competition in the leading class, it may be assumed that Tulip culture is still actively carried on in Lancashire, Cheshire, and other adjacent counties.

The best flowers staged in the various classes are comprised in the following list:—*Bizarres*, feathered: Commander (Marsden), a grand commanding bloom, fifty named, having a rich golden ground and fine dark feather; it sometimes comes a little stained in the stamens, and sometimes pure; Masterpiece, fine both in colour and marking; Royal Sovereign and George Hayward—a bloom of the latter shown by Mr. S. Barlow was pure, large, and finely feathered, but lacked form, being uneven on the petal edges; these are fine standard varieties, somewhat widely circulated. Of newer flowers there were Nonpareil (Ashmole), very fine—it comes flamed also, but in its feathered form it is very rich in colour, of a deep rich yellow; Dr. Dalton, one of the late Dr. Hardy's raising, apt to come short of head when in the flamed state; sometimes caught in excellent form, but in its general character regarded as an uncertain flower; and *Aesclepias* (Thurstan), broken from a grand buff breeder. It is believed raised from Sulphur and Dr. Hardy, partakes of the shape of Sulphur, but has the purity of Dr. Hardy; indeed, as shown, it was very pure, with a bright red feather. Lord Randolph (Dymock) will be found described in the report of the Tulip show; the peculiarity about it is that though a feathered *bizarre* it is said to have been raised from two *byblomems*. Excelsior, which was shown both in the feathered and flamed classes, is oftenest flamed. It is one of Dr. Hardy's seedlings. It is as good in the broken as in the breeder state, good also both feathered and flamed, the feathering dense, sometimes comes a little stained on the petals. Agamemnon (Hep-

worth) is a feathered *bizarre*, not shown to the best advantage on this occasion, and at present in very few hands indeed. General Grant, another of Hepworth's raising, is in the same way, but a thoroughly first-class flower, and has a vivid scarlet feather on a rich yellow ground. Mr. Barlow gives it a very high position. William Wilson (Hardy) is own brother to Dr. Dalton, hardly first-class, though a bold dashing flower, will come good at times, but a bit inclined to coarseness. The leading flamed *bizarre* was the evergreen Sir Joseph Paxton, a flower that never fails and sometimes breaks out into a fine feathered form.

Feathered *Roses*—a charming class—were well represented by Nancy (Gibson, Industry, Modesty, Heroine, and Charmer. A fine new variety was present in Mrs. Thurstan (Thurstan), from Kate Connor & Sarah Headly, pure, the whiteness of the ground perfect; charmingly feathered with deep rose-scarlet—one of the finest of its class in cultivation, and which may be written down as *ex. ex.* Julia Farnese is decidedly pleasing to the eye, its heavy feather contrasting so markedly with the purity of the white ground; but it has so much colour laid upon the edges of the petals that it is denominated "plated," lacking the life seen on a petal which is perfectly feathered; it was a little small as shown, but good in form. The best flamed roses were *Lily C. Gordon* (Lighthou), nearly a flamed flower: it occasionally has streaks of yellow in the base that do not "bleach out" as the growers say; *Old Heroine*, still a most useful and popular flower; and *Annie McGregor*.

The *byblomems* were this season weaker than the other two classes; the best feathered flowers were Mrs. Cooper, Talisman, shown in the flamed character also; *Adonis*—also flamed; John Hart, and King of the Universe, two flowers raised by Mr. W. Dymock, of Stockport, the last is apt to come with slightly tinged stamens: the former was seen in fine condition a year ago. Flamed *byblomems* were further represented by Lord Denman and Chancellor; the last is a Midland flower, but apt to "shoulder" and present itself in a bad form. Mr. Barlow had what was regarded as a good strain of it, but threw it away, not deeming it worthy a place in his collection.

The best breeder Tulips were, *bizarres*—Sir J. Paxton, Dr. Hardy, and Horatio; this last is one of the late Mr. R. Headly's seedlings, very fine in the breeder state, but worthless when broken; it has a free bright yellow base, and light orange-red petals; it may be termed a red *bizarre* breeder. The best rose breeders were Mrs. Barlow (Hepworth), A I as a breeder, and of a beautiful light rose colour, but worthless when broken, for it usually breaks badly; the colour is right when rectified, but it has no character; Thomas Parker, a Wakefield flower; and Miss Burdett Couatts. *Byblomem* breeders were represented by Glory of Stakehill (Ashmole), probably the best breeder Tulip in cultivation, but when broken weak and wanting in character—a very tall grower, but lovely in its dress of silvery grey with the faintest tinge of mauve; Alice Grey, raised by Walker of Winton, colour very light lavender; it breaks into a fair *byblomem*, both feathered and flamed, but it cannot be relied upon; but it is a beautiful breeder, and has won as a premier among breeders many times.

Two entirely new rose breeders were shown by Mr. Thurstan, the raiser; one was named *Tryphena*, a beautiful flower, charming in colour, perfect in shape, and with a waxy-white base; and *Typhosa*, of the same class, and of similar character in regard to build to the feathered rose Mrs. Thurstan. The raiser appears to have obtained a fine break of seedling Tulips, more of which may probably be seen next season.

The late John Slater, who was an undoubted authority in the matter of Tulips, once said that "feathered flowers are generally more abundant after a severe winter than when it is a mild one." On applying to Mr. Samuel Barlow for his experience in reference to this matter he said that he had a great many very fine feathered flowers in 1885 after a mild winter. The opinion held by Slater is one among many entertained by the old Tulip growers, but some of them have not borne the test of a larger experience. R. D.

CHRYSANTHEMUM G. WERMIG.

This yellow flowered sport appears to be earlier in blooming than Madame C. Desgranges, the white blooming Japanese *Chrysanthemum* from which it came. I infer so from the fact that when I was at the Royal Nursery, Slough, a few days ago, some

of the workmen were bringing in from the open ground and potting a number of plants of both the varieties named above, and though they had occupied the same open position when planted out, one—the sport—was a few days in advance of the other in opening its flowers. What a fine bank of these two varieties Mr. Turner could set up at South Kensington in another fortnight, were it not for the expense that would have to be incurred in getting a large quantity there. Is the earliness of the yellow sport as compared with Madame Desgranges generally noticeable? R. D.

COLONIAL NOTES.

THE VEGETATION OF NEW SOUTH WALES, &c.

A RECENT trip by railway to Sydney, distant from Melbourne nearly 600 miles, gave me the long-wished-for opportunity to see something of the vegetation of the oldest and neighbouring colony of New South Wales, so I made as good use of my eyes and brief opportunities as possible to note the various matters of interest *en route*.

I started at 6.55 A.M. on May 17, making the journey through in twenty-four hours. The extreme dryness of the country was very marked soon after leaving Melbourne, and continued so the whole way; every water-hole was dry—not a blade of green grass was to be seen, although the country over which the train runs is comparatively flat between a goodly number of high hills, which were never, or scarcely ever, situated nearer the train than, say, three miles. The hills nearly all the way were clothed with *Eucalyptus trees*; these, judging by the immense quantities of fire-wood cut up into foot lengths, must have been largely interspersed with *E. melliodora*, yellow Box, and at times the summits of the bills were observed to be clothed with *Casuarina quadrivalvis*, and others of the "She Oaks" probably. The want of grass and water must have been severely felt by the settlers, cattle being scarcely ever observable, but plenty of sheep and goats. I must mention, however, a goodly donkey of good caste and her foal, the latter being busily at work biting the spines of a dry Thistle! This was near Glenowen and the Strathgogie ranges, where the Kelly gang of bushrangers enjoyed a short but terrible time of it, so far as the victims were concerned, until surrounded and captured, then hanged for their crimes. By a-bye the Murray River is crossed, and Albury, 190 miles from Melbourne, the first station in New South Wales, is reached. Here the passenger's carriage trains, and meanwhile stop for dinner (about 1.30 P.M.), and which is obtainable at the station refreshment-room at the cost of 2s. 6d.

The New South Wales country nearer Sydney is more interesting, I think, and is certainly more picturesque, judging by the moonlight views I had at times from the carriage window. We reached Sydney at 6.40 A.M. on May 18. The approaches by train to Sydney proper are sadly marred by the entire removal of the native vegetation; indeed, I may add that Sydney is sadly behind in the way of tree planting for shade, &c. (verified by after visits to the city), and this is, I think, much owing to the very poor water supply for the city, fed by some wretched swamps near Botany Bay. The supply of pure water will, however, soon be obtainable in quantity from some mountain source, and it was a healthy proof of the same when I was in Sydney to see the large wrought-iron pipes laid in a line for an *ad interim* supply—these were about to be laid below ground. Let us hope the Sydney authorities will seek and act upon advice (based on long experience) of Mr. C. Moore, F.L.S., the Director of the Sydney Botanic Gardens, and plant largely the proper shade trees so conspicuous by their absence in and around this the oldest city of the Australian colonies.

The trees largely used for shade, &c., in the public reserves, and connected with the Botanic Gardens, are *Ficus macrophylla* and others of the genus, also *Pinus pinaster*, &c.; these seem to require an artificial watering. To a person desirous of making a botanical pilgrimage there is no more interesting spot to visit than that contained within the fences of the Sydney Botanic Gardens. How often we hear of the giant *Arcaurica excelsa* trees, the finest cultivated ones known, I believe. I stood below the towering heights of two of these, measuring at least

120 feet from ground-line to top, and a diameter at 4 feet from the soil of at least 5 feet. A very fine *A. Cunninghamii* is also growing near by, almost, if not quite, as tall, but not so shapely as the others named. *Poinsettia pulcherrima* and other (trees in Melbourne) greenhouse plants were here found luxuriating as free-growing and rather tall shrubs. The general area of the gardens has been increased nearly one-half by additions from the late Exhibition Palace grounds, &c. The sward of the lawns is composed of *Stenotaphrum glabrum* (Buffalo) and *Cynodon dactylon* (Daub or Couch), the latter giving more satisfaction in some parts of the grounds, as it does not suffer so readily from extreme drought as its neighbour. The mowing is done by a very heavy, and, indeed, clumsy article, made by one of your famous makers, but which is said to do the work well; it needs, however, one horse and two men, all hard at work, to enable it to perform its daily tribute of lawn trimming.

The greenhouses or conservatories were by no means found to be leading features of interest. Certainly two very handy new ones, well and cheaply made, have recently been added, about 40 feet long by 20 feet wide, with very perfect apparatus, but the plants in them, as in the others, are very poor and uninteresting; this, the foreman explained to me, was due to the fact that the Garden Palace Exhibition, which not long since was burned to the ground, contained most of their best plants, which it had taken many years to grow. A national loss truly!

NATIVE FLOWERING PLANTS.

My observations were not confined to Sydney proper, for I was enabled to see something of the beautiful native flora fringing the waters of Port Jackson. The large as well as small steamers go seemingly everywhere within this most picturesque and enchanting harbour, so that one has no difficulty in getting to spots full of interest to lovers of plants. About 9 miles from Sydney by steamer is a well populated town called Manly; this is met for and aft by the ocean and harbour water, and is rather exposed to the strong winds. The beauty or pride of Manly, Coogee, &c., is, however, centred in the native plants growing on the heights and among the rocks above the residences. Among many others I observed *Eugenia myrtifolia*, *Leptospermum lanigerum*, *Banksia ericifolia*, flowers full of honey-like fluid; *Grevilleas* of various dwarf species, *Epacris impressa* and *E. longiflora*, *Westringia rosmarinifolia* (the last-named growing everywhere on declivities and rocky spots), *Smilax glycyphylla* in berry, growing in interstices of the rocks (it is much used for medicinal purposes, and said to be in that way equal to the imported Sarsaparilla). The value of many of the native plants to cultivators is their flowering, or continuing to do so, in the coldest months—May, June, and July—more especially those of the *Epacridaceæ* and *Proteaceæ*; the wonder is, under the circumstances, that our native plants are so very seldom seen in our gardens, especially as they are so suitable to give winter effect.

Among the introduced European and other trees, which, to my surprise, I found thriving so well both in Sydney and at Parramatta (about 14 miles distant therefrom) was the British Oak, *Quercus Robur*, which seemed to flourish because of the richness of the soil, despite the great heat in summer overhead. Going by railway, one is pleasantly surprised to find so pretty an inland town—where once the Governor resided—so well laid out, streets at right angles, plenty of shops, and much other evidence of prosperity. Entering the public park by an archway through or under a brick castle-like lodge, the first objects for attention are the Oaks planted many years since by some champion of disorder; they are very irregular, too close together, and much stunted in consequence, yet the shade must be delightful in summer. I measured one (felled there were several others equally fine) whose diameter was found to be 2 feet 9 inches and 70 feet in height. There are here, interspersed with them, some of the largest *Pinus pinaster* and *P. pinea* I had ever seen, about equal in height and girth to the Oaks. I may observe here that the only grass growing in the park is *Cynodon dactylon*, no other would succeed here so well on account of the heat. There are some splendidly healthy *Orange trees* not far from the town, which, when in flower, fill the air with their fragrance. At this time of year these "trees of life"

are laden with their "fruits of gold." I was unable to visit the orangeries, so can only speak of what I have heard, or judge by the few specimens seen. Returning to Sydney—this time by water (Parramatta River)—I was certainly disappointed at not seeing any very luxuriant vegetation on either side, and no Orange trees, but was rewarded by the scenery—rocky points, and promontories, recesses, &c., all the way down this arm of the sea to Port Jackson. The Mangroves (*Carallia* species) sticking their forklime roots into the muddy edges of the banks on either side of the river look very peculiar, the foliage being very much like that of *Ficus australis*. I am sorry to say that where I observed in some of the suburbs of Sydney, that *Araucaria excelsa* trees had been planted for shade in the streets (for which they are eminently unsuitable), the lower frond-like branches were cut off up to 5 and 6 feet to make them answer the purpose. Need I say that no greater failure can be chronicled than this one!

Much reclamation of sandy coastland has been

FIG. 93.—PRINCESS ALICE AT ROCK: WHITE.

effected at various places, more especially at Manly (before referred to), which is in sight of the Heads. Mr. E. Badmington, builder and contractor, informed me that when he landed there thirty years ago no settlers were there excepting the original occupier and his family who by purchase from the Crown became the owner of the whole area, comprising many hundreds of acres, and had the principal portion, especially the sandy ground, planted with Buffalo and Couch grasses. Mr. Badmington assures me that the late Mr. H. G. Smith (shipowner), the original occupier, would often go out in rainy weather, with only an umbrella over his head, and plant rooted joints of these grasses, and he was many times assisted by Mr. Badmington in so doing; and what is proved besides the reclamation of such an area, principally of sandy land? Why—that the Buffalo and Couch grasses (and more especially the Buffalo), are of the greatest possible value as sand-staying plants. I have seen the Buffalo growing fairly at Queenscliff (Heads of Port Phillip), but was not prepared to find it so unmistakably successful as at Manly in New South Wales. *A. C. N., South Yarra, Melbourne, July 25.*

CONTINENTAL NOVELTIES.

NEW PERPETUAL TEN-WEEK STOCK, PRINCESS ALICE (LORENZ).—Mr. Chr. Lorenz, of Erfurt, is about to put into commerce a new variety, and one likely to be appreciated by all who wish to have a good outdoor flower. In the open ground the plant grows, we are told, 2 feet high, and if sown early it produces uninterruptedly from May until November, and often until December, an abundance of beautifully shaped flowers of the purest white, which contrast well with the dark glossy green foliage. The flowers, which appear in each axil of the flower-stalk, are produced in long succession, and afford excellent material for bouquets at a time when only few other flowers are obtainable. This variety, which has been awarded two 1st prizes, is likely soon to become a general favourite, being equally well adapted for pot culture and the open ground.

ZINNIA ELEGANS ROBUSTA GRANDIFLORA PLENISSIMA (LORENZ).

The constant endeavours of Herr C. Lorenz in improving popular flowers have enabled him in course of time to introduce flowers of great merit, such as Pansy Emperor William, *Diadem Pink* (*Dianthus gladematus*, fl.-pl.), *Gomphrena globosa nana compacta*, *Gaillardia picta Lorenziana*, *Dianthus atropurpureus* (Mourning Cloak), and others, and are now again rewarded with a new success. By careful endeavours of many years he has succeeded in raising a new large-flowering double *Zinnia* of great perfection, which will be put into commerce this year.

The plant, we are informed, differs from the old variety in its luxuriant robust growth and the deep green colour of its large leaves. It forms a handsome bush, similar to that of a *Dahlia*, of 3 feet or more in height; above this the flowers display themselves on slender stems. The flowers appear in uninterrupted succession, and form perfect blooms from 5 to 6 inches across, whereas the petals of the old double *Zinnia* overlap each other like scales, giving a flat appearance to the flower; those of this novelty, which are of double the size, and are much more numerous, so that they often cannot find room enough for development, are forced to pile themselves up on each other so that the flower has an appearance quite different from that of other *Zinnias*. The intense and brilliant colouring of the flowers is in keeping with the robustness of the plant. The richness of the shades of colour is promising, as hues appear which are not to be found amongst the older forms of *Zinnias*. The flowers preserve their beauty for about three or four weeks, even in the hottest weather. On account of its luxuriant growth and its large bright flowers this novelty is particularly valuable for large groups, and for planting singly and as a border plant in small gardens. The engraving (fig. 94) represents a flower of medium size. A number of cut blooms of this *Zinnia* were shown at a meeting of the Erfurt Horticultural Society on the 6th ult., where they were much admired. Herr Lorenz, speaking of his introduction, says:—"I believe it is not too much to say, that by careful selection for many years I have raised the *ne plus ultra* of double *Zinnias*."

PLANT PORTRAITS.

SCOTCH NOTES.

EARNOCK AND NEILSLAND, HAMILTON.

EARNOCK and the adjoining estate of Neilsland, the properties of John Watson, Esq., are perhaps two of the finest examples in Scotland of what may be done by energetic enterprise assisted by good taste in the improvement of landed property. Mr. Watson, when he came into possession of the two estates, a little over ten years ago, found them neglected in every respect. There was little to adorn either of them in the way of trees except a considerable number of ancient Oaks scattered singly over the estates, more especially that of Earnock. These Oaks, many of them of noble dimensions, with trunks sound and

the mighty Oaks, and what is called the Norval Plantation was the first step taken towards the accomplishment of the plan. The park is, or rather was till recently, raked very much by the gales which blow from the south-west, the quarter whence for about nine months of the year that the most unfavourable winds to tree growth in the locality chiefly blow. The Norval Plantation extends along the south-west boundary of the park for nearly a mile, and is of varying breadth and outline, measuring many acres in area. Along its outer line are many of the ancient Oaks already mentioned, always solitary, or at most in pairs, with groups of Beech, Sycamore, and other deciduous tree evidently planted from 80 to 100 years ago. The inner part, or that facing the park, has been planted most successfully by grouping trees for effect. Deciduous trees, such as purple

affording it any shelter. Bearing in mind that the trees have only been planted about ten years, the growth they have made is surprising, as the following dimensions of some of them will testify:—*Cedrus atlantica*, 7 to 12 feet, *Oriental Spruce*, 8 to 12 feet, *black American Spruce*, 5 to 9 feet, *Austrian Pine*, 8 to 12 feet, *Douglas Fir*, 12 to 15 feet, *Nordmann's Fir*, 10 to 14 feet; *scarlet Oaks*, 10 to 18 feet, with fine spreading heads—many of the growths of the present season measuring 2½ to 3 feet; purple and variegated *Sycamore*, 18 to 25 feet, with corresponding top; *American Limes*, 18 to 24 feet, doing very much better than the European species; *cut-leaved* and *silver Birch*, 18 to 25 feet, making splendid heads.

Before leaving the Norval Plantation it may be interesting to many to note that the *black American Spruce* which has been largely planted in the evergreen groups appears to be specially well adapted to the locality and soil. The latter is a good loam of moderate depth resting on clay. There was not an unhealthy tree, all were thrifty, and growing well. It was noticeable also that in another part of the park distant eastward some 600 or 700 yards, where this tree was planted on the south-western side of another plantation it was almost the only one that was thriving. Here in the teeth of the blast broken by the Norval Plantation, this proved to be the only tree that could maintain perfect health and symmetry. All others were more or less weather-beaten, this alone was perfectly at home, though making slower growth than those enjoying the shelter of the inner side of the Norval Plantation.

Near the entrance gate next Hamilton there are some remarkable specimens of Conifers planted about the same time as the Norval Plantation. The shelter here is of greater density, and the result is seen in the growth of the Conifers. We noted measurements of *Abies nobilis* from 25 to 30 feet high; *A. lasiocarpa*, 18 to 20 feet; and *A. Nordmanniana*, 18 to 20 feet. These were all feathered to the ground and in perfect health. In front of these, on a broad stretch of grass on either side the carriage road, were some handsome *Hollies*, which, however, did not present the same thriving appearance as the Conifers hard by. It was noticeable, however, that *Hollies* were not happy at any point on the place, and few, fortunately, had been made use of in the scheme of planting.

THE MANSION

lies about half a mile from the gate, and is a handsome building of mixed style of architecture. We noted on the right a fine *Horse Chestnut*, which, enjoying, as it had done, the shelter of a few friendly Oaks standing a little way off, is the most perfect and handsome specimen of its kind. It forms a massive pyramid of about 40 feet in height, by about 80 feet wide, the drooping branches concealing the stem; and about this part commence some acres of massive clumps of choice hybrid *Rhododendrons*, which quite surround the mansion. The pleasing aspect of the clumps defined by broad glades of well kept lawn, the splendid specimen plants comprising the best selection of new and old varieties obtainable at the time, give a well furnished appearance to this part of the grounds which is so rarely observed in old places recently improved, as this has been.

The so-called Back Avenue, which leads from the left of the mansion, is a spacious carriage road, over-arched by grand old Oaks, Elms, and Beeches, but for the space of about 150 yards in length immediately after leaving the house it is open, and bordered on either side with a continuous mass of *Rhododendrons*, each bank varying in width from 10 to 15 yards. The bank on the right runs parallel with the old garden wall, which is well concealed by the bank and the fine specimens of *Rhododendrons*, which are interspersed here and there with the largest specimens of *Japanese Maples* to be found in Scotland. The *Rhododendrons* here and everywhere throughout the place are full of flower-buds, giving promise of an abundance of flowers next year.

On the left of this avenue, near the eastern termination of the *Rhododendron* banks, are the stables, embowered in trees, and deserving of passing notice here on account of the striking effect of their massive architectural features on the grounds at this point. A massive Norman archway, flanked on either side by towers, gives access to a spacious corridor, the roof of which is groined and panelled, cathedral fashion, with *Pitch Pine*. The ample courtyard lies beyond, in the centre of which is a handsome four-

FIG. 94.—DOUBLE ZINNIA: NATURAL SIZE. (SEE P. 460.)

straight, are very old, yet they are for the most part in perfect health and make vigorous growth. They are probably the remains of that part of the old Caledonian Forest, the most perfect remains of which are to be seen at Cadzow, some 2½ miles south of Earnock. But the most assured interest that attaches to these fine Oaks is that their existence and well-doing gave the valuable suggestion to Mr. Watson: "If these grand old trees have stood the brunt of storm and blast for hundreds of years in the isolated and unsheltered condition in which I find them, what might they not have been had they been sheltered and supported by neighbours like themselves?" This led to the further suggestion, that even yet much might be done to prolong their existence and increase their vigour by planting for shelter, while the aspect of the place would be greatly improved at the same time. Being a man of action as well as of taste, no time was lost in developing plans to carry into execution this suggestion, called forth by

Beech, purple and variegated *Sycamore*, broad-leaved *American* and *European Limes*, *scarlet Oaks*, *silver* and *cut-leaved Birch*, *scarlet Pavia*, *red* and *white-flowered Horse Chestnuts*, *Paul's* and other ornamental *Thorns*, *Cherries*, *Service* and other species and varieties of *Crataegus* and *Pyrus*, are planted in groups of three, five, or seven each, along with interjacent groups of evergreen trees, comprising *Austrian* and *Scotch Firs*, *Abies Douglasii*, *P. Nordmanniana*, *P. nobilis*, the *black American* and *Oriental Spruces* and *Cedrus atlantica*. The effect is beautiful, and the object aimed at—the production of shelter for the park by means of masses of handsome trees and shrubs—has been attained with much success.

The young trees have grown to such a height that they effectually prevent the wind from rushing through beneath the tops of the old Oaks and other trees that had previously formed the thin boundary line of the park on this side without

tain and around are the stables and other necessary buildings.

Just opposite to the stables is the entrance to the old garden, an area of some 6 or 7 acres in extent, and possessing much diversity of feature. Formerly it was the vegetable and flower garden of the establishment, now it is partly orchard, but mostly pleasure ground. The Earnock Burn, a pretty little stream, winds with many a sweep through the narrow glen in an easterly direction. On the northern bank lies the old garden in a series of irregular terraces and natural slopes. The old walls of the terraces are so densely clothed with masses of *Asplenium Trichomanes* as to appear at a little distance only abrupt variations of the bright verdant surface. The interesting and varied character of this choice bit of landscape is best observed from the opposite side of the glen, which rises with greater abruptness, with rocky projections, and diversified with many old Oaks and Beech, with here and there splendid specimens of old Scotch Fir. This bank is reached by means of a bridge which spans the burn in the neighbourhood of the door by which the old garden is entered. On the right of the bridge the little stream assumes the form of a tiny lake before gliding over a precipitous rock of considerable height. Passing along the winding path the varied beauties of the old garden are bit by bit unfolded to view. Here, by the stream, is an embowered hollow, overspread luxuriantly with Ferns to great variety, which soften the rugged banks with their rich green foliage till it merges in the lawn above. Slightly in rear of the central crowning rock at this point rises a group of very old English and Irish Yews, which by their sombre green and deep shadow give a charming variety of tint, and impart an illusive impression of depth to the hollow beneath. On the right and left stand a purple Beech and silver Birch respectively, both of large dimensions, each casing a fringe of its foliage about the fernery hollow, as if to shield it from the scorching mid-day sun.

To the right and left of this point the lawn forms easy undulations, broken up with clumps of Rhododendrons, and handsome specimens of Golden Yews, standards and pyramids, which are allowed to develop themselves in a naturally free manner, the heads of the latter of which were in several cases of the unusual dimensions of 7 to 8 feet diameter. A plant of *Taxus adpressa* is worthy of special notice, being a handsome pyramid of about 12 feet in diameter at base. A rather melancholy interest attaches to the remains of a gigantic dead Scotch Fir, which stand near this Yew. It rises with a clean straight stem to the height of 92 feet, having a well developed head. The girth of the stem, 5 feet from the ground, is 11 feet 6 inches. The tree ceased to live two years ago, and Mr. Watson has determined that it shall remain where it grew until destroyed by natural decay. On another spot hard by is a perfect specimen of *Thuopsis dolabrata*, a memorial tree, planted by Lady Dehavan, daughter of Mr. Watson, in 1878. It is now 9 feet high by about the same width of base. Space will not permit us to enumerate all the objects of interest in this delightful spot, but we cannot leave it without briefly noticing The Knoll, which is one of its most interesting features from an historic if not from a purely horticultural point of view. It lies at the western end of the old garden on the crest of a steep rocky bank overlooking the Earnock Burn. It is a grass-clad mound of almost circular form and of considerable height above the surrounding surface levels, surmounted by a cairn. Three very fine old Scotch Firs, almost uniform in proportions, stand about equidistant from the cairn and from each other on its sides. Here we learn from a tablet placed by Mr. Watson in the garden wall close by are buried the remains of several Covenanters. They had fought for the Covenant at Bothwell Brig about three miles distant, were defeated and pursued by the Royalists, and overtaken near this spot and instantly shot. Their bodies were buried on the Knoll, the cairn raised and the Firs planted by friendly hands to mark the resting-place of those who had fallen in defence of liberty of conscience.

The glass erections, which stand near the house in a square, walled in, comprise a few useful fruit and plant houses. Mr. Watson's attention and tastes have been almost exclusively devoted to the developing of the broader features of the very fine park, but we understand there are plans projected for the erection of a very complete range of structures on a scale

commensurate with the other features of the place. We must defer our notes of the interesting features of Neilsland till a future occasion. A.

The Flower Garden.

THE past few weeks of dry weather have revived the occupants of the flower beds, and, where the plants have not been strong in growth, the colour is as bright and dense as at any period of this season. Such weather as we have recently been having cannot be expected to continue at this advanced time of year, and a watchful eye must be kept over tender subjects which it is desirable to preserve for next season's display. It is scarcely safe to allow Tree Ferns, Palms, Cycads, and other greenhouse subjects to be out-of-doors, as a change of wind may bring frost on any day. Much time will have to be given to sweeping leaves off lawns and walks, so as to keep them neat and tidy.

WINTERING BEDDING PLANTS.

The housing of bedding plants will now demand immediate attention; where structures are at command for the special purpose of wintering these, the work is easy of accomplishment, but unfortunately there are exceptions, and as a general thing bedding plants will be huddled into all kinds of structures. *Pelargoniums* will winter well in a Peach-house, where a sufficiency of heat, can be commanded to exclude frost. Allow them all the air possible, and never shut the house up unless during cutting winds and frosts. The same situation will be found to answer for *Koenigia variegata*, *Tropeolum*, *Nemesium*, *Antirrhinum*, *Heliotropis*, *Petunias*, *Verbenas*, &c., keeping them as near the glass as possible to prevent them from drawing. *Coleus*, *Iresines*, *Alternantheras*, and the more tender subjects must be wintered in a warm house near the glass; in fact, they winter most successfully when kept gradually on the move during the winter months, but great judgment must be exercised in the administering of water. *Calceolarias*, *Gaznias*, *Violas*, *Chrysanthemums*, *Phloxes*, *Antirrhinums*, *Pentstemons*, and other hardy cuttings, may be still put up to strike, but the sooner this is done the better.

SOWING.

A successional sowing of the following hardy annuals may still be made in sheltered, but not shady, positions, on light but not rich soil:—*Alyssum maritimum*, white; *Bartonia aurea*, yellow; *Calliopsis*, yellow spotted; *Candytuft*, white, lilac, and purple; *Leptosiphon densiflorus*, lilac and white; *Gilia tricolor*, white, lilac, and purple; *Eutocia viscidula*, dark blue; *Eschscholtzia californica*, yellow; *Erysimum Peroffkianum*, orange; *Colt's nivalis*, purple and white; *C. grandiflora*, blue and purple; *C. verna*, blue and white; *Limnanthes Douglasii*, white and yellow; *Lupinus nanus*, blue and white; *Malope grandiflora*, crimson; *Nemophila insignis*, pink; *Saponaria calabrica*, pink; *Silene pendula*, pink; *Virginian Stock*, red and white; *Specularia speculum*, blue, lilac, and white. Should slugs prove troublesome a few Cabbage or Lettuce leaves distributed over the beds will be found a good remedy for them. They should be turned over every morning and examined.

Sweet Peas may be sown in sheltered positions. They are perfectly hardy, and if staked when a few inches high, they will bloom in the spring and be much appreciated.

SPRING BEDDING.

Where spring bedding is carried out everything should now be decided upon, and the earliest opportunity should be taken to prepare the beds for Hyacinths, Tulips, &c. They should be well dug up, and have a few inches of leaf-mould, or well-decayed manure, mixed with the soil. Very pretty arrangements can be made with bulbs if planted in colours. Keep the white towards the centre of the beds, and then the pinks, scarlets, and blues, using an edging of *Cerastium*, *Aubrietia*, or any hardy subject. Many of the carpet beds may be made to serve for spring beds by substituting hardy plants for such as *Coleus*, *Iresine*, and *Alternanthera*. Daisies will make a good substitute for the latter, and *Nyosotis dissitiflora* will creditably take the place of *Lobelia*. Then there

are colours innumerable of Primroses, Violas, and dozens of other things admirably adapted for the purpose. *W. Baillie, Luton Heo Gardens.*

THE ORCHID HOUSES.

PHALÆNOPSIS.

THE remark that these grow best in old houses is often heard; I think this is due to their getting a regular supply of air and not too much at one time, for I believe that a sudden drying of the house during hot weather, caused by too much ventilation, is a greater check to these plants than a low night temperature. Nearly all the modern houses are built with simultaneous ventilators, and this is often overlooked when air is given, as many people I have noticed will open a continuous ventilator as wide as they do when there are only a few detached ventilators here and there.

We have tried different experiments here for Phalænopsis. A few years ago a house was fitted up that one might have thought was almost perfect; hot-water pipes were made to pass through troughs so that the air on entering the house might carry with it warmth and moisture. A high temperature was kept up and the house was closed in the afternoons in time to secure plenty of sun-heat. Under this treatment the plants grew freely, some making leaves 12 to 15 inches long, but their career was soon cut short; on one very hot day the leaves seemed to melt, and in a few days all the fine foliage had disappeared, but they did not lose their centres and having plenty of roots soon grew again, but it was thought wise to fall back on the old system and have patience. I mention this to show that these plants can be easily made to grow too rapidly, for a time at least. But what we should endeavour to accomplish is, to keep them in health for many years.

There is another fault with many new houses: they are built with the idea of having an almost too clean and neat appearance rather than for the well-doing of the plants, and not enough provision is made to hold moisture that would be drawn upon when the atmosphere of the house became dry. It is all very well to have plenty of evaporating troughs on the pipes, but these do not act in summer, when moisture is most required, and in winter they give off a rather unnatural vapour, different to that which the Orchids enjoy in their native quarters. Some people think that plenty of open tanks in a house helps to keep the air moist, but I think I have proved with hygrometers that very little comes from these without hot-water pipes to assist them. It is a question whether a large surface of cold water in a heated house does not act as a condenser, drawing moisture from the air. In ventilating the Phalænopsis-house I find it answers well not to have both bottom and top ventilators open at the same time, but during summer to give air only at the top; but besides this there is an opening of about half an inch at the eaves, which is never closed night or day while the weather keeps warm. In winter the bottom ventilators are used more.

During the present month we might expect dull foggy weather at times, also a few degrees of frost; therefore it is safer to keep a little heat in the pipes, even if the temperature is rather high. The present is a very good time to go over the plants, picking out all sphagnum which has become rotten. Take care not to touch the points of the roots now, as these are in a growing state. There is generally sufficient growing sphagnum about the plants to top-dress them with. It is better to add a few new crocks instead of so much top-dressing at this time of year. Cover the roots as little as possible, otherwise during winter they rot off close to the plant; although they keep alive where they cling about the basket or cylinder, they are of little use when the fleshy part near the plant has decayed.

MISCELLANEOUS.

Many of the Cattleyas that have not finished their growth will require careful watering. If too much moisture accumulates within that part which encases the bulb, keep the plant drier, or if it looks likely to rot the bulb the casing might be just slit with the point of a knife, which will cause the moisture to dry out. While we get bright days this month well damp all the houses through the warmest part of the day, while there is plenty of air on, instead of damping after they are closed; but later in the season, when

more fire-heat is necessary, this can be reversed. If a house be set apart for Dendrobates that have finished growing, a dry atmosphere, with plenty of ventilation, will suit them. Where *O. odontoglossum*, *Phalaenopsis* and *O. vexillarium* have been placed in the cool-house for the summer, they should now be returned to the coolest end of the intermediate-house. The temperatures for the present, without sun-heat, should be:—East India-house 70°–75° by day, 65°–70° at night; Cattleya-house, 65°–70° by day, and 60°–65° at night; these temperatures should vary with that of the outside. The cool-house, if closed at night, will do without fire-heat while it keeps near 50°. (In last Calendar, on *Odontoglossums*, it should have been, "Tear the moss away rather deeply, then pinch off the green heads to top-dress with.) *C. Woolford, Downsidge.*

PLANTS AND THEIR CULTURE.

WINTER BLOOMERS.

POINSETTIAs should be shifted on as they fill the pots until the size required is reached; those which have filled their allotted size with roots must have a constant supply of liquid manure as well as a little fertilizer of some kind twice a week, giving them space to develop their foliage fully. Admit air freely on all favourable occasions, so as to keep them stocky; and if the pots can be plunged in a mild bottom-heat so much the better. Avoid a damp dank atmosphere, as fine evenly developed bracts are produced only by keeping the plants near the glass with air. Continue to propagate for late work, for, notwithstanding that they are looked upon as autumn and winter decorative plants, *Poinsettias* are useful for late spring use. I had last season a nice batch in 7-inch plants that retained their leaves and bracts bright and fresh up till June. *Euphorbia jacquiniiflora* is another fine useful plant which admits of the same treatment as the *Poinsettia*, with the exception that the watering at the roots must be done with much care, excess of water causing the stems to rot off at the collar, or to lose their bottom leaves. The plant may still be increased by cuttings, and young stock may be shifted. All plants standing in borders should have their growths regulated, and the points trained to yards the glass.

BOUVARDIAS.

Any specimens of these which were lifted a short time ago will now have got fairly established, and should be picked over, and the shoots regulated and tied in a little, giving them a little manure-water to assist them when throwing up their trusses and expanding their blooms; the double varieties are useful for winter and spring use. Those fine double varieties, Alfred Neuner and President Garfield, are now well known, but the newer varieties, *Triomphe de Nancy*, *Sang Lorraine*, and *Victor Lemoine* are fine additions to this class, and should be grown in every collection. The stock of these should not be allowed to flower for the present, but must be encouraged to grow. Look well over all kinds of winter and spring stock, and if there be more plants wanted for forcing, these should be obtained without delay, and potted and plunged in coal ashes until required. *A. Evans, Lythe Hill.*

FRUITS UNDER GLASS.

PEACHES.

TREES should be examined directly after the fruits have been gathered, and all spurs resulting from summer pinching cut away, together with any shoots of last year's growth that in the usual way would have to be removed two or three months hence, at the winter pruning. This will let in plenty of light among the branches, and assist thereby to ripen the wood better than would otherwise be the case. Any trees of shy-bearing varieties which, in consequence of the light crops which they bore this season, have made too luxuriant growth, should, with a view to encouraging the formation of fruit-buds, have a trench about 2 feet deep opened at 3 feet from the base of the trees, cutting all the roots close back to that distance with a sharp knife, afterwards refilling the trench.

FIGS.

Trees of these which have made too much wood should be operated on in the same manner as recommended for Peaches, for the purpose of checking growth, and to promote the formation of embryo fruits on the said shoots, which, owing to the slight check thus given to the trees by the severance of, perhaps, several thick roots, will form in the axils of the leaves before the fall of the latter. *H. W. Ward, Longford Cast.*

HARDY FRUIT GARDEN.

THE STRAWBERRY BEDS

should be finally looked over and all runners removed from the plants. If the old mulching has been tightly turned under the surface soil, as was recommended in a former Calendar, but few weeds will now be found between the rows. Any that there are should be cleared away forthwith by hand weeding, as it is beneficial to the plants to keep the soil open and loose on the surface throughout the winter months. Young plantations of Strawberries made in August and beginning of September, and where no mulching was given, should likewise have the surface soil between the rows lightly loosened with the fork, in order to allow the winter rains, &c., to pass quickly from the surface.

WALL TREES.

The nailing of trees should now be commenced and pushed on as fast as possible before the cold weather sets in. It is not necessary to wait until the foliage has all dropped before making a start, especially where the walls are extensive. We generally take the Apricot trees first, doing all the necessary nailing, and leaving the final touch to the spur-pruning until the leaves have fallen. We have just gathered the last of our outdoor Peaches and placed the fruit in the late vinery, where they will ripen by degrees as they are required. Dessert Plums, such as *Guthrie's Late Green*, *Coe's Golden Drop*, and *Isleworth Imperatrice*, are much improved for this purpose by similar treatment, gathering a few dozens at a time.

The best culinary Plum we have ripe at this date is *Belle de Septembre*, which is larger than the generality of late varieties. All late Apples and Pears will be as well gathered in by the end of the third week in this month, but much will depend upon the state of the weather. When harvesting these late ripening fruits thought must be taken of the situation of the trees.

FRUIT GATHERING.

Standard trees heavily cropped and in exposed positions, should have their crop gathered at once should rough wintry weather set in, or one half the crop may be blown off in a single day and may be rendered only fit for immediate use. Generally speaking, late fruits are in a much more advanced state of maturity than they were at the corresponding time last year. Undoubtedly this has been brought on by the unusually dry state of the subsoil as compared with several preceding seasons, nevertheless, the fruit does not seem to have degenerated in size on this account. As the late varieties of Pears are being placed upon the shelves of the fruit-room all defective fruits should be kept by themselves; particular attention to this saves a lot of labour later on, to say nothing about the damage done to the bulk by constantly having to move them about, in order to remove decayed fruits which should not have been placed amongst those stored with the intention of long keeping. Walnuts should be knocked off the trees about the middle of the month, and all those which free themselves from the husk, after being wiped over and put out to dry are fit for immediate use. The remainder which are not quite ready to leave the husk, should be put on a dry shelf until they part freely, when the shells can be cleaned and the nuts stored in a dry cool place in perfectly dry sand or sawdust. *G. H. Richards, Somerley Gardens, Ringwood.*

KEMPERFERA ATROVIRENS.—This is a newly introduced Bornean stove plant, with long sheathing leaves and oblong acute blades. The flowers are 1½ inch in diameter, deep violet with a yellow blotch at the base of the lip. It is figured in the *Illustration Horticole*, t. 610.

The Kitchen Garden.

LIFTING AND STORING ROOTS.

MOST of the root crops will now be in a condition for lifting and storing; opportunities should, therefore, be taken during intervals of dry weather to secure the respective crops, and of storing them whilst in a dry condition. A cool cellar or shed, secure from frost, is best adapted for this purpose, and where the roots can be stacked in moderate and convenient quantities, and occasionally looked over; unless the structure is a dark one and free from draughts the roots should be covered with some kind of dry litter or bracken, or, better still, packed in brick bins constructed for the purpose, and covered with dry sand or sifted ashes.

BEETROOTS

will be one of the first to be secured, and to ensure their being of a good colour will require more care in lifting than any other; the roots should be lifted as intact as possible, and without being bruised or damaged in any way, nothing being removed from them with the exception of a few of the outer and decayed leaves, which should be twisted or pulled off before removing them to the root-shed, where they can be stacked, leaves outward, until these have withered away, and afterwards finally cleaned over and stored.

SALSIFY, SCORZONERA, AND CHICORY, &c.

These should follow, and any small, deformed, or otherwise useless roots discarded at the time of storing. Of the latter a few roots should be planted in pots or boxes, and placed in the Mushroom-house to produce bleached leaves for the salad.

TURNIPS.

These should be pulled when large enough for use, and before they become tough and leathery, at intervals during the winter; Turnips, unless the weather be very severe, will continue to grow most of the winter. Large full grown roots of these suffer most from severe weather, the action of the frost causing them to split and afterwards rot, whereas the smaller ones frequently escape, and during mild intervals continue to grow up to Christmas.

PARSNIPS AND CARROTS.

Generally the former are best lifted from the ground as required for use, until they commence to grow in spring, but in some cases, where the ground is naturally wet, and the roots given to coker, they are best lifted and stored. All the main crops of Carrots should be taken up, assorted, and stored. The late sowings of the Horn section, for use in a small state, may be allowed to remain in the ground for some time longer.

JERUSALEM ARTICHOKEs,

being practically hardy, may be lifted at any time before spring, but it is best to have a supply on hand. Provision should be made for next year's planting, by putting on one side a portion of the smaller and best-shaped tubers for seed. Where suitable and proper storage space cannot be afforded under cover, all the roots mentioned can be wintered in pits outside, the essential conditions being that too many are not placed together to become heated and rotten, and also that rain and frost are effectually excluded.

RHUBARB AND SERRAULE FOR FORCING.

To prepare and hasten the ripening of the crowns, a sufficient quantity of each for the first batch should be partially lifted, by having a digging-fork or spade thrust under them, and prised high enough to break off and separate some of the largest and most fleshy roots, the individual plants being allowed to settle down again into their former positions until they are deemed ready for removal to their forcing quarters.

GENERAL WORK.

Keep the surface of the soil hoed between Lettuce, Cabbage, and the like, and make another planting of the latter; earth-up the earliest and most forward plantations, taking the precaution before doing so to give the whole surface a good dusting of quick-lime to check and destroy slugs; the same remark also applies to Celery, which should be treated in a like manner prior to each sowing. Plots of ground as they become vacant should be manured if necessary, and trenched or dug over as the case may be, allowing the surface to remain as open and rough as possible. *John Austen, Willey Court Gardens.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Oct. 11	Sale of Bubs from Holland, at Stevens' Rooms.
	Sale of Bubs from Holland, at Protheroe & Morris' Rooms.
TUESDAY, Oct. 12	Continuation of Sale at Cranston's Nursery, Hereford, and till the 14th inst.
	Sale of Orchids at the Castle Nursery, Lower Norwood, by Protheroe & Morris, Royal Horticultural Society; Meetings of the Fruit and Floral Committees, at 11 A.M.; and Show of Hardy Fruits (two days).
WEDNESDAY, Oct. 13	Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms.
	Sale of Dutch Bubs, at Stevens' Rooms.
THURSDAY, Oct. 14	Meeting of the National Chrysanthemum Society, at the Royal Aquarium, Westminster.
	Sale of Plants, Bubs, &c., at Protheroe & Morris' Rooms.
FRIDAY, Oct. 15	Sale of Dutch Bubs, at Stevens' Rooms.
	Sale of Nursery Stock, at the Wood Lane Nursery, Isleworth, by Protheroe & Morris.
SATURDAY, Oct. 16	Sale of Dutch Bubs, at Protheroe & Morris' Rooms.
	Sale of Dutch Bubs, at Stevens' Rooms.

THE islands of JERSEY and GUERNSEY have long been celebrated for their magnificent Pears (Chaumontels) and the supply of early Potatoes and other choice vegetables for the London markets. Of late years a new trade has sprung up—that of Grapes and Tomatoes—which already in extent and importance seems destined to eclipse all others. Great quantities of Grapes and Tomatoes are now cultivated in all parts of the country and for sale, but it is as nothing in comparison with the enormous supplies coming from these islands. Something akin to astonishment must be expressed at the extremely rapid development of this trade. In Guernsey especially the erection of so much glass has already quite transformed the appearance of the island. Glass everywhere! It may well be termed the island of glass! Glass! House after house, vinery succeeding vinery!—it is no exaggeration to say literally by the mile, meet the eye in every direction. In certain parts they seem to be attached to every dwelling, to form a part of every holding—in some cases scores of large houses, covering acres of ground, in others a single house or two tended by the industrious labourer in his spare hours, with the assistance of his wife and family.

Favoured by Nature with a mild warm climate and a fertile soil, the cultivation of Grapes of a certain quality is by no means a difficult matter. Glass has been, however, found necessary, although little or no firing is required excepting it may be for the early or late crops—those from heated houses being termed hot-house Grapes, and from unheated houses greenhouse Grapes. A great quantity of the Grapes grown are, it must be admitted, very inferior, the Vines are overcropped—a little more attention to their cultivation would be of great advantage. The wonder seems to be now—that this trade should have been allowed to slumber so long. The supply of good cheap Grapes has never been equal to the demand. "Good Grapes are always dear, and when scarce very dear," as a writer in the *Standard* remarked the other day. The variety of Grapes grown in Guernsey is chiefly the Black Hamburg. These are cut as soon as they are ripe, packed in baskets containing about 16 lb. each, and sent off to the London markets, being consigned to Covent Garden salesmen, and sold generally by public auction. Prices vary according to season and the quality of the fruit, good Grapes being often sold at 9d. and 1s. per pound, and those of inferior quality at much less. When from this have to be deducted cost of carriage, commission, and other charges, the prices returned to the grower are often ridiculously small. One grower remarked to us that being in Covent Garden once he saw his own Grapes sold, and for which he was to receive 1s. 6d. per pound. Wishing to send some to a sick friend in the

afternoon he went to a shop and had to purchase his own Grapes at no less than 6s. per pound.

It seems interesting to ascertain what may have been the direct cause of the rapid development of this trade. It is not far to seek. It is undoubtedly the growing taste for Tomatoes. No other plant grown has become so universal a favourite in so short a time as the Tomato. Twenty years ago Tomatoes were comparatively unknown and generally disliked; to-day they are the most popular of all vegetables—relished alike by youth and age. It is this demand for Tomatoes—this crop requiring somewhat similar accommodation to Grapes—that has enabled Guernsey farmers to invest their capital in the erection of so much glass. Grapes take a few years to establish and to make a return for the outlay—Tomatoes make an immediate return, they being grown in the same house as the Grapes until the latter become established. Thus Grapes and Tomatoes become associated together, and together make a more and more profitable return to the grower than would otherwise be the case. The amount of capital invested in this trade must be considerable, and the employment afforded to the people of the greatest importance.

To the question—Does it pay? there seemed to be but one answer—Yes. At the time of our visit (the end of August) the trade in Grapes and Tomatoes seemed to be at its height. We seemed to meet them everywhere, but all bound for London. It is a pretty sight to watch the loading of the Southampton steamer with thousands of neat baskets from the carts that keep arriving up to the last minute. Where room can be found for them all, or how they can be packed, seems a mystery. In one day over 2000 baskets of Tomatoes left the island of Guernsey by the Southampton steamers. This gives some idea of the enormous trade existing. The following figures, received on official authority, will serve to show the rapid increase of the trade:—

No. of Baskets sent by the Southampton Route.

1881, Tomatoes ..	16,072	..	Grapes ..	24,624
1882, " ..	21,025	..	" ..	28,253
1883, " ..	34,619	..	" ..	40,284
1884, " ..	46,000	..	" ..	49,268

And in the year 1885, quoting from the official statement submitted to the Chamber of Commerce, there were no fewer than 60,000 packages of Grapes exported, representing a total weight of 500 tons, valued at £40,000, and of Tomatoes about a similar quantity. The population of the island of Guernsey does not exceed 40,000, so that the value of the Grapes and Tomatoes alone, £80,000, is equal to £2 per head of the entire population. Very few countries can show such a satisfactory return as this. No wonder that these islanders are happy and contented with their Home Rule!

Jersey is not so completely covered by glass as its sister, Guernsey; several of the most extensive and important establishments are, however, to be seen here: we need only mention the old establishment of Mr. POND—one of the first large growers in the island. The long narrow houses, tier above tier, on the steep terraces, are very quaint. In direct contrast to this is the modern monster establishment of Mr. BASHFORD, near St. Heliers. We are almost afraid to say how much glass there may be, but we have it on our notes as about 33,000 square feet, or 2½ miles of houses in length.

The houses are all span-roofed and of gigantic proportions, one 480 feet long and 44 feet in width; another 890 feet long and 33 feet wide, and so on. These are all, with one exception, devoted to the culture of Tomatoes and Grapes. One great house, however, is planted with kidney Potatoes for Christmas. Of Tomatoes some 22,000 plants were planted out. One

house contained 5300 plants, from which it is estimated to cut during the season about 120 tons. Up to the present time Mr. BASHFORD has cut about 90 tons. The variety grown is a selection from Trophy—one fruit weighed 2 lb. 1 oz. Of Grapes the variety chiefly grown is Gros Colmar, and of this something like 20 tons. The sight in some of the houses 600 and 800 feet long is truly magnificent, the size of both bunch and berry, and the quality, being all that could be desired. These will be marketed during the winter, and will realise high prices. *Abropos* of this, Mr. BASHFORD tells us how, being once in Covent Garden, and looking at some Gros Colmars, remarked that "he had some twice the size." "If that be so," said the salesman, "I'll give you 6s. per pound for all you've got." "Hand me a form," said Mr. BASHFORD, on which he wrote, "Send Mr.— 6 tons of Gros Colmars at once!" One of the grandest sights here, however, must be the fruit-room, when filled, containing 10,000 bunches of Grapes in bottles.

— LARIX GRIFFITHII.—The history of this tree has been given so recently in these columns by Sir JOSEPH HOOKER (see p. 95), that we should not have reverted to it were it not for the doubt expressed, whether cones had been produced in this country. The coneless plants, especially when young, are difficult to distinguish from the common Larch, and hence probably many specimens considered to be the Himalayan Larch are really of European origin. Once, however, that the cones are produced there is no further doubt possible. The cones illustrated at p. 465 (fig. 95) were forwarded to us by Mr. NANSICAWEN, gr. to Col. TRELAWNY, Menheniot, Cornwall, and were when first singularly beautiful, the deep orange-brown of the projecting bracts contrasting with the glaucous green of the scales. The cones are much larger than those of any other species of Larch. In the seedling plant the seed leaves are five or six in number, linear-pointed and much longer than the immediately succeeding leaves.

— CHANGE OF ADDRESS.—The address of Messrs. FOLLOWS & BATE, Limited, Horticultural, Agricultural, and Domestic Implement Makers, for the future will be Garton, Manchester.

— CALCEOLARIA BURBRIDGEI ×.—From Mr. BURBRIDGE we have received specimens of this autumn flowering hybrid said to be a hybrid between *C. luehdioides* as the seed parent, and *C. pavonis*, pollen parent. It is a very ornamental plant, of robust habit and large many-flowered cymes of yellow flowers—altogether a very desirable plant.

— SUNDERLAND PARKS.—The post of Curator of these parks has been conferred by the Corporation, on Mr. W. H. FERGUSON, who for the past six years has been in the employment of Messrs. LITTLE & BALLANTYNE, of Carlisle, as landscape gardener. There were 175 applicants for the appointment.

— VICTORIA NURSERIES.—Mr. G. PHIPPEN informs us that the business which has been carried on by himself and the executor of his late father's will, will be carried on by himself solely.

— SEEDLESS PEARS.—Mr. BURBRIDGE sends us from the Trinity College Botanic Garden, Dublin, specimens of the Bishop's Thumb Pear of an elongated oblong form, destitute of core and seeds. These fruits, which are merely swellings of the flower-stalk, are produced from the second crop of blossoms which had not energy enough to produce carpels (core) with ovules or ripe seeds.

— BAD SETTING GRAPES.—Various causes have been assigned for this defect, but the most reasonable seems to be deficiency of temperature accompanied by excess of moisture. In the German vineyards, according to M. MÜLLER, this tendency to set badly is obviated by removing a ring of bark half an inch in depth below the lowest bunch. We have heard of ringing fruit trees, but have never seen it practised in the case of the Vine. Probably the partial cutting off the supplies of water from the root may lead to the concentration and consolidation

FIG. 95.—*LARIX GRIFFITHII*: THE HIMALAYAN LARCH, GROWN IN CORNWALL. (SEE P. 464.)

above the wound and consequent fertility. A seedless condition, as in the Currant Grape, is attributed to defect of pollen-power which suffices to cause the fruit to swell, but is not sufficient to quicken the germ into embryo life.

— "REICHENBACHIA."—The last part of this superb publication contains coloured plates of—*Dendrobium Wardianum*, with analytical details by Professor REICHENBACH.

Lelia autumnalis var. *anthotrophia*.—This beautiful species is made use of by the Mexicans to decorate their churches on saints' days, although they have to bring them from a great distance. Sometimes t'e natives save themselves the annual journey by bringing the plants from the mountains to their gardens, where they fasten them to the trees. These plants are often enormous masses, from 8 to 20 feet in circumference. European botanical collectors have looked upon these huge plants with envious eyes, and have occasionally been successful in making a bargain with their owners, and have sent home the established plants. It is one of those Orchids requiring all the sun, air, and water that can be given it during the growing period (May to October), while during the resting period no water at all should be given, and only sufficient heat to exclude all risk of frost.

Phalenopsis grandiflora var. *aurca*.—For the culture of these plants great heat, copious moisture, and shade are required. They are among the most difficult plants to import. Collectors even take the trouble to ship casks of rain-water for the plants during the journey, but notwithstanding all this trouble and expense the plants often die during the passage through the Red Sea.

Cattleya Lawrenceana.—The history of this plant and its re-discovery by Mr. SEIDL and Mr. IM THURN has been given with a portrait in our columns, so that we need only add that this plant succeeds best, in Mr. SANDER'S experience, at the warmest end of the Cattleya-house, exposed to full light and sun, and is best adapted for pot culture. After flowering it should be placed in a cooler part of the house, and allowed less water.

— DISTRIBUTION OF PLANTS.—It is announced that the Commissioners of Her Majesty's Works and Public Buildings intend to distribute this autumn among the working classes and the poor inhabitants of London, the surplus bedding-out plants in Battersea, Hyde, the Regents', and Victoria Parks, and in the Royal Gardens, Kew, and the Pleasure Gardens, Hampton Court. If the clergy, school committees, and others interested will make application to the Superintendent of the Park nearest to their respective parishes, or to the Director of the Royal Gardens, Kew, or to the Superintendent of Hampton Court Gardens, in the cases of persons residing in those neighbourhoods, they will receive early intimation of the number of plants that can be allotted to each applicant, and of the time and manner of their distribution.

— ORCHID NOMENCLATURE.—We find the following remarks by Professor REICHENBACH on this subject under the head of *Phalenopsis grandiflora* var. *aurca*, in the last number of the *Reichenbachia*:—"There has lately been a great deal of controversy respecting the nomenclature of Orchids both by those who are versed in the matter, as well as by those who are not. No one seems to have been successful in formulating a plan on the subject worthy to be followed. Those who are able to perceive the difference between garden and botanical nomenclature will doubtless arrive at the conclusion, that it is not possible to bring both into harmony, for so long as the botanist has to serve garden interests he will have to study the ideas as well as the tastes of amateurs. This was LINDLEY'S view, and it is also mine. Of course, science ought not to stand still for the sake of amateurs; on the other hand, these cannot be expected to follow every change in the views of scientific men, as these are often founded upon circumstances which to an amateur are unfathomable. I have never endeavoured to thrust upon amateurs such undoubtedly necessary changes as the merging of the genus *Cattleya* into *Epidendrum* or *Lelia*, and *Schomburgkia* into the genus *Bletia*. The amateur is often thoroughly conservative in nomenclature, and many a busy man, to use LINDLEY'S own words, is satisfied when he has learned the oldest name of a plant. He is generally

glad to dispense with the nicer distinctions. In fact, the plant is often to him merely an object of sport" [fancy]. Professor REICHENBACH then gives the history of LINDLEY'S *Phalenopsis amabilis*, which is really *Phalenopsis Aphrodite*, the true *amabilis* of BLUME being the same as that which LINDLEY called *grandiflora*. "I do not, however," continues the Professor, "intend to press my nomenclature into garden circles, and I think it impossible to persuade amateurs to accept new Draconian laws, or to induce them to rechristen their favourites."

— THE METRIC SYSTEM.—Our good friends of the *Bulletin d'Arboriculture* are making fun, as well they may, of our retention of a stupid system of weights and measures, and they have found out that in Covent Garden, the centre of London, the system of weights and measures is even more idiotic than anywhere else. Our contemporary details four different kinds of punnet, according as the measure in question is filled with Seakale, Radishes, Mushrooms, or salad. There are sieves and half-sieves, bushel sieves and bushel baskets, pottles, hands of very varied capacity, bundles and bunches of equally vague size. Our contemporary thinks it is a spirit of patriotism which induces us to retain these diverse and irrelevant measures: if so, it is the patriotism of the lunatic asylum.

— ESSEX FIELD CLUB: THE FUNGUS FORAY, 1886.—We are informed that the seventh annual Cryptogamic meeting of the Club will be held on Friday and Saturday, October 15 and 16, in Epping Forest. It is intended to devote the Friday to the collecting of specimens, and to their examination and arrangement by experts, and on the Saturday to hold an exhibition of fresh and preserved botanical specimens, microscopical objects, drawings, &c. The exhibition, which will be confined to subjects from the vegetable kingdom, but not necessarily to the Cryptogama, although that division will hold a very important place, will be opened at about 4 o'clock on Saturday, October 16, in the large ball-room attached to the "Roebuck" Inn, Buckhurst Hill. Ample time will thus be afforded for its careful examination by the visitors present.

— LESPEDEZA STRIATA, THE JAPAN CLOVER.—We have been favoured by Messrs. HURST & SON with a sample of seed of this Clover. The seeds are in brown husks, and very light, and when rubbed out are like English Clover seed, but rather more purple in colour. It appears that the seeds are sold in the husks; a bushel weighs 15 lb. only, while a bushel of English red Clover seed weighs from 64 to 66 lb. It would appear that this Clover is becoming very popular in the Southern and South-Western States, where it first became widely known as a cultivable plant eight or ten years ago, although it is said to be indigenous to most parts of North America. From there we get confirmation of the fact that it stands the severest tests of drought and wet seasons equally well, flourishing on all kinds of soil, but growing most luxuriantly upon good land, rich in lime. All kinds of stock are fond of it. It is further reported that it is much used in Apple and Peach orchards, and when once it has obtained a good hold of the soil it goes far towards choking all weeds, and most of the wild grasses.

— HORTICULTURAL PALACE AND COLONIAL FRUIT EXHIBITION.—We read the following in the *Keating News* of October 2, 1886:—"Of the many schemes brought forward to unite the colonies with the mother country there is none which appeals to a refined and luxurious people more than the one now proposed, whether it will meet the hard-headed business men of the colonies has to be proved. The promoter, who dates his letters from 175, Brompton Road, S.W., tells us he intends to rely on Nature's productions to attract a public desire of entertainment, and not over-anxious to be improved or educated in the arts, sciences, and 'ologies.' To read the prospectus seems rather like a page from the *Arabian Nights* than a description of a business undertaking. The architect's plans show a building of glass and iron, cruciform in shape. At the junction of the nave and transepts will be a circular court, surmounted by a dome 150 feet high; in this will be placed a grand organ, with galleries running round. The whole of this court and dome will be filled in with stained glass illustrating the history of the British

Empire from the earliest times. The glass in the court devoted to the fruit bazaar will illustrate Indian subjects. Running out of the main avenue, which will be about 450 yards long, are fourteen conservatories, seven devoted to India and the colonies, and seven to the British Isles. The flora of each colony will be shown in the house devoted to it. There will be a tropical-house and a viney and orchard-houses running round the grounds which will be used as a promenade. There will be kiosks and tea-houses in the open spaces, an hotel and dining club will be erected at one end, having a covered entrance from Willesden Junction Station. The club is intended as a rallying point for business men connected with the colonies, and a pleasant resort for others. The members will have special privileges for entrance to the exhibition for Sunday promenades, *fiat* days, &c. Turkish baths will be attached to the hotel. Arrangements are being made for lines of rapid steamers from the colonies exporting fruit. All the English varieties of fruit will be on view throughout the year, as New Zealand and other places will supply when the home-grown are finished. There will be competitive flower and fruit shows in every month of the year. A small court is to be devoted to colonial wines, European wines being strictly excluded. The site comprises 16 acres, and is the most accessible spot in the London district for an exhibition, with close railway accommodation. In addition to the Willesden Junction Stations, the Great Western main line runs within 200 yards of the Exhibition grounds. Buds, electric illuminations, the attractions of Kew and South Kensington combined, cannot fail of support when carried out on business principles. It is not intended to interfere with any existing interest, and the promoter believes there is room enough for all who honestly endeavour to give the public value for their money. It is hoped the Exhibition will be ready for opening in October, 1887."

— AGRICULTURAL EDUCATION.—We are glad to find that instruction in the principles of agriculture is to be given in many towns this winter. As will be seen from the subjoined programme of a class to be held at Watford, the lectures will be to a large extent as useful to gardeners as to farmers:—

Subject: Agriculture. Master: J. W. ODELL (First-class Certificate, Special Training Course for Teachers, South Kensington Science School). The class will meet on Friday, October 1, and succeeding Fridays, at 7.30 P.M. Fee, 5s. for the entire course of about thirty lessons, including examination fee.

The course of lectures in Agriculture will treat of:—

1. *Soils*.—Their Formation and Variations in Character.—Distribution of—Classification of—Chemical Constituents of—Causes of Fertility.

2. *Plant Life*.—Its Infiniteness—Sources from which Crops get their Food—Plant Food in the Soil—Active and Dormant Matters in Soils—Influence of the Mechanical Condition of the Soil on Plant Life—Diseases.

3. *Manures*.—Farmyard Manure, its Production, Composition and Character—Good and Bad Management—Action of Manures in the Soil—Artificial Manures; Salt, Lime, Chalk, &c.—Their Mode of Use and Special Properties.

4. *Tillage Operations*.—Mechanical and Chemical Changes—Influence of Atmospheric Agents—Drainage of Land—Influence on its Temperature, and on the Health of Stock—Choice of Crops—Rotation of Crops.

5. *Live Stock*.—The Economy of good Stock Management—Special Requirements for making Land either a good Dairy Farm or a good Sheep Farm, or good Grazing Land.

6. *Food*.—Chemical Matters present in various kinds of Food: in Milk, Green Food, Hay and Corn, &c.—The different Materials necessary for the Growth of the Body—Maintenance of Heat—Process of Fattening.

— SAPONARIA OFFICINALIS.—In *Taxographical Botany* it is stated that this plant, although not indigenous, is recorded for nearly all the counties of England, as well as for some in Wales, where some botanists consider it as indigenous, and in Scotland. It has also been introduced to the United States. Considered apart from the fact of its being frequently cultivated the rate of distribution in this country would have been remarkable especially for a perennial; but its rapid spread must be attributed in great part to its former reputed value in medicine, and also to its economic value as a soap. Mendicant friars formerly used it for the latter purpose, bruised or boiled in water; and the plant, not being indigenous, must have been pretty common in cottage gardens, often rich repositories for old-fashioned herbs, flowers,

economic and other useful plants. The plant is no doubt an outcast from gardens in many of its reported stations, and its creeping underground habit, coupled with the fact that double-flowered forms occur, would support this view. The latter form is established in the Isle of Wight at some distance from houses or gardens. The plant is recorded as naturalised in the south-west of England and in Wales, but the same recognition ought to be made for Sussex on the great expanse of shingly beach eastward from Eastbourne, where in some places it is the most prominent feature of the vegetation by far, and flowers so profusely as to give its own tone of colour to the shingle. Almost every shoot flowers, the reverse of what takes place in gardens generally, where the flowerless root-suckers, especially in rich soil, become a nuisance to all well-behaved plants. This profuse flowering habit on otherwise almost barren shingle suggests the idea of planting it in poor, gravelly, or sandy soil, where, however, it might have access to sufficient moisture at the root. The species is figured in the third edition of SYME'S *English Botany*, t. 197.

— THE ORANGE CROP IN VALENCIA.—As an illustration of the importance of the Orange crop in Spain, it is stated that from the port of Valencia alone over 3,000,000 Oranges have been shipped in the course of one season. The fruits, which are considered the best of their kind in Europe, can now be delivered in England at 9s. the box, leaving a fair margin of profit to the producer.

— FLOWERS IN SEASON.—MR. EWBANK sends us from his garden of floral treasures at Ryde some very fine flower-stems of *Watsonia rosea*, rose-purple in colour, and as high again as the tallest *Gladiolus* grown; a flower of the clear yellow *Sterbergia lutea*, a novel colour in bulbous flowers at this season; and the whitish-green flower-spike of *Orobolobus lacteus*.—MR. E. J. LOWE, Shirenewton Hall, Chestport, writes as follows:—"I have been asked to send you some blooms of a new cross between *Mimulus cashmirianus* (of gardens) and *Mimulus cardinalis*, the former the seed bearer. The habit is that of *cashmirianus*, about 6 inches in height, and the flowers, as you will see, are very varied and brilliant, and quite distinct. I only send a few, but there are at least one hundred good varieties. They are quite hardy and great bloomers. With the *Mimulus* are enclosed two of my hybrid Dahlias. The white one, Lily, is a pointed-petalled flower, habit dwarf and very floriferous—to-day there were seventy-four blooms on one plant. The blooms are more like a Lily than a Dahlia, and as a border flower it is very effective. The other Dahlia (*Sir Joseph Hooker*) is a cross with *Bidenis Zimpini*, and is the blackest Dahlia I know, good in form, medium in size, and having very bright yellow stamens; it is the most conspicuous flower in my garden. The bright yellow on a nearly black ground has an extraordinary effect. Amongst my single Dahlias I have this year about fifty of the most distinct and brilliant Dahlias that it is possible to conceive." [The markings on the *Mimulus* are very striking, and the colours of the brightest. We have not seen such regularity in the disposition of the colours as are exhibited by your strain. The white Dahlia has just that shape that pleases, and which so many "improvers" of the flower try to efface, and make monotonously regular. Ed.]

— THE SECOND YEAR'S PRODUCE OF A GRAFFED POTATO.—THE REV. G. HENSLOW writes:—"MR. WORTHINGTON G. SMITH gave some account with figures of his method of grafting Potatoes in the *Gardeners' Chronicle* (1886, pp. 54, 186), and exhibited some tubers resulting from his 'plug-grafting' at a meeting of the Scientific Committee of the Royal Horticultural Society. These were the produce of *Paterson's Victoria* × *Mr. Dreese*, and of *Magnum Bonum* × *Early Border*. I planted on March 16, 1886, one tuber of each of these two crosses. The tuber of the first kind weighed 3½ oz., and presumably perished in the ground, as nothing came of it. The other weighed 6½ oz. It was about 3 inches in length, but bent in the middle. The first year's result of this cross between *Magnum Bonum* and *Early Border* MR. SMITH described as 'astounding as regards form; some examples suddenly curved at the end like shepherds' crooks; others like the letter U, with both limbs closely depressed; some very irregular, with large gouty projections; some curved like the letter C, with the two ends

almost touching; some like the letters L and Z. My results of the present season—i.e., the second year's produce—were a little more satisfactory. The total weight of the tubers, fifty in all, from the above, was 6½ lb., or just 100 oz., in return for 6½ oz., or a gain in weight of 1600 per cent. The eight largest tubers averaged 5 inches in length, with a maximum of 6 inches by 2, being only 1 inch across at the constriction; but like MR. SMITH'S produce of the first year, they were all misshapen, but not to the extent that he described. They mostly had constrictions in the middle or at one end; two were curved more into semicircles than like the letter V, and one or two showed super-tuberation. Besides these eight, there were ten tubers of a good oval form, averaging 3 inches by 2 inches; eight tubers, 3 inches by 1½; eight, quite round, being about 2 inches in diameter; eight smaller ones were about 1½ inch long, six were 1½ inch in diameter, and only two so small as 1 inch across. Boiled for table they proved very fair eating. I purpose planting six of the first lot of eight, the largest and misshapen tubers, and six of the well-formed tubers next season, to see what the third year's produce may be like."

— FOREST TREE PLANTING.—In view of the increased attention which in recent years has been given to arboriculture, and the near advent of the tree-planting season, it is interesting to learn that Her Majesty's Commissioners of Woods and Forests propose continuing planting operations on a large scale on the waste Crown lands in the Isle of Man. Messrs. DICKSONS & Co., nurserymen, of 1, Waterloo Place, Edinburgh, have, we learn, been entrusted with a contract for supplying a large quantity of forest trees for this purpose, to be delivered on the island in the month of November from their nurseries at Piltig and Liberton. It is to be hoped the example set by Government may have its effect on owners of waste land in every part of the country, as, apart from the improvement and increased value it affords in the interests of the owners, the ameliorating influences of planting on the climate, the labour which the carrying out of it affords at a season when employment is scarce, is a matter of great public importance.

— PORTUGUESE PLANTS.—It is announced in the *Boletim da Sociedade Brotaria* that the Director of the Botanic Garden at Coimbra, Professor HENRIQUES, is prepared to exchange dried specimens of Portuguese plants which are rare in barbaria for other plants.

— FRENCH MARIGOLDS.—Some of the neatest flowers in form, pure and brilliant in colour, have been submitted for our inspection by MR. R. DEAN. They include selfs, striped forms, and some which are very effective, the rays being of a rich velvety vandyke-brown with a thin edge of gold. We understand that the habit is dwarf.

— TOBACCO GROWING.—The best sample we have yet seen are some leaves of the "Virginian" variety, grown in the nurseries of Messrs. LUCOMBE, PINCE & Co., of Exeter. The colour is of a rich golden-brown, and the perfume aromatic. The leaves, at present, have not been cured, so that it is too early to talk of results. We understand that Messrs. LUCOMBE, PINCE & Co. have followed very carefully the cultural directions given by Colonel TREVOR CLARKE, in our columns.

— PUBLICATIONS RECEIVED.—*The Maintenance and Revivification of Grass-land from a Chemical Point of View*. By B. DYER, F.C.S., F.I.C. (London: VINTON & Co., Limited, 9, New Bridge Street, Ludgate Circus, E.C.)—*Illustrated Handbook of Victoria, Australia*. (London: Colonial and Indian Exhibition.)—*Mary's Meadow*. By J. H. EWING. — GARDENING APPOINTMENTS.—MR. PERKINS, late Gardener to the Right Honourable Viscount DOWNE, Dingley Park, Market Harboro', has been appointed Gardener and Bailiff to the Dowager Countess of ELESMEER, Burwood House, Cobham.—MR. ARTHUR RYDER, formerly Gardener to LORD BATEMAN, Shobdon Court, Herefordshire, has been engaged as Gardener to Sir WILLIAM ANDERSON OGG, Oakfield, Dalwhich, S.E.—MR. G. WALL continues at Breakspears, Uxbridge, as Head Gardener to the new proprietor, W. S. GILBERT, Esq.

EXEUNT TEAS.

IN his article on p. 430, "D. T. F." concludes with an unanswerable piece of logic. The Tea Roses, says he, are the Roses of the future: they must vastly increase while the so-called perennials are doomed to decrease: they deserve double honours and chances—and moreover, unlike most worthies, they have got their deserts, therefore let the privileges that they so deservedly enjoy be taken away! It has been said that statistics will prove anything, but evidently logic runs a great horse over the favourite course of argument. The Teas must go; the case is clear against them. Even if there could be any person still unconvinced, there is a final count—most damning charge of all—which cannot fail to carry conviction to every mind that they justly deserve, the verdict of expulsion, they distract the judges!

There were several people who did not observe the wild and wandering eye, indicative of a man distraught, among the phalanx of judges at South Kensington last July; but no doubt it was to be seen, and it is absurd to suppose that the victims should be expected to divert their judicial faculty to horticultural subjects of a less "disturbing" nature; therefore the Teas must go. It is their own fault of course; they shouldn't distract and disturb, and they must be content to be the Roses of the future and not want recognition in the present. As the frenzied amateur said of a certain modern School of Music, "If it's the music of the future, what the semibreve does it want to come bothering *now* for?"

Some of those people whom "no logic of reason or of fact ever will convince," may ask what a "general collection" of Roses is, and wherein it will differ, when the Teas and Noisettes shall have been eliminated from it, from a "special class"? Ladies may plausibly inquire how they shall identify Ben. Cant's seventy-two if *Souvenir d'Elise* is to be excluded? and *Lacarne*, with the air of a man endeavouring to tilt his hat back with the tip of his own nose, will want to know, you know, whether it is to be Guillot's yellow hybrid perpetual that is to replace the gold of *Marchal Niel*, "expulsed"? Some people ask such inconsiderate questions, and are not deterred even by the threatened distraction of our judges.

A whisper may come from certain eastern country gardens asking what honours a "stand wholly of Teas can sweep off" beyond the 1st prize in its class and possibly a medal for the best bloom?—an award open to every stand in the show. There are even those in whom the suggested Tea-totalism arouses the widest intemperance; here indeed (say they) would be the fulfilment of the exhibiting rosarian's highest ambition—an achievement for which it would be worth while to grow grey in the work of Rose-showing. Imagine a box of forty-eight Teas distinct, which should win against all-comers of all and any kinds; there would be a galaxy of beauty, and exquisite harmony of pure and tender colour, marred by no loud and jarring tones! Tea-garden sentiments truly. As if that could possibly be any compensation for the distracting disturbance of a judge's mind.

The fact is, the matter lies in a nutshell. Because a certain class of Roses, once supposed to be delicate and difficult of cultivation, was encouraged and fostered by the provision of special small classes; because the cultivation of these Roses gradually extended until now a class for thirty-six blooms brings out as many competitors as did formerly a class for six blooms; because their blooms are now grown as large as the finest hybrid perpetuals (there were actually sixteen distinct Teas in the championship seventy-two this year, and fifteen last year); because they are now grown by thousands instead of tens, and still "must vastly increase"; because they are found to be as easy to grow, in the South at any rate, as hybrid perpetuals, and are more generally useful; and because they are "the Roses of the future"; all this is no reason why they should create a disturbance; and if they will do so, of course they must submit to be "checked and regulated."

There are one or two weak points in "D. T. F.'s" draft "for the better regulation of Teas;" for instance, there is no mention in the National Rose Society's schedule, which was the subject of "Wild Rose's" discussion, of a class for baskets of seventy-two A. K. Williams; but if they were there, cavillers might be inclined to point out that it could hardly be complained that the hybrid perpetuals had no special class devoted to them.

The assertion that Rose showing is responsible for the limiting of the Rose season to a month during June and July, is somewhat incongruous when immediately followed by the statement that "this is the natural season for perfect Roses in England!" Of course; it is because the Roses bloom at the end of June and the beginning of July that the shows are held then; and an indefinite extension of the exhibition season would be fraught with many inconveniences. Those who grow largely have budding and so on to attend to. Most people are off in August to the sea, to the North—scattered abroad in all directions. Those who go on showing again in September have other things to care for—Dahlia, Gladiolus, &c., while if they must needs go—all the time they find Roses very well provided for at the general summer shows.

A national Rose (or any other) society, to be able to run shows destined to be unpopular and unremunerative, must indeed be "strong and wealthy"; but "D. T. F.'s" allusion to these off-season shows is another weak point in connection with his new Tea rule; for the earliest and the latest flowering Roses are the Teas, and it cannot be considered good policy to be attracting attention to and advocating those varieties which are already "undue favourites," and which it is so desirable to "exclude from general collections," for the purposes of halving their chances of well-deserved honours and of avoiding their creation of a disturbance, to the "distraction of the judges. T. W. C.

GREVILLEA SULPUREA.

THAT New Holland shrub, or something extremely like them, lived in this country as native inhabitants at one time is unquestionable, but that was a very long time ago, and a great deal has happened since then. It comes, therefore, rather as a matter of surprise to find that such species as *Grevillea rosmarinifolia*, illustrated in *Gardener's Chronicle*, at p. 529, vol. v., n.s., and *G. sulphurea* are not only hardy in this country, but that they actually produce flowers in the open air. For the specimen here figured of *G. sulphurea* (fig. 96) we are indebted to Messrs. Veitch, in whose nursery at Coombe Wood we recently saw the plant. Its striking appearance and interesting character should commend it to lovers of curiosities, but it is as well to caution them that the dry soil and sunny slopes of Coombe Wood enable many plants to live which elsewhere would succumb.

By way of illustration we may mention, that on the same visit as that above mentioned we saw a Banana from Southern Japan apparently as contented as the Australian Protead, although it had been out for two winters.

FOREIGN NOTES.

STRAW PLAIT INDUSTRY, NEAR FLORENCE.—A recent report to the Foreign Office on the Florentine straw industry, by Consul-General Colnaghi, of Florence, contains so much of interest that we gladly place it on record and give it wider publicity than it otherwise would secure, by publishing an abstract of the entire report. Opening with the history of the straw hat industry Mr. Colnaghi says it was originally confined to the "Contado" of Florence, where it existed in the sixteenth century. From this district it gradually spread into other parts of Tuscany and of Italy. The industry appears, however, to have become of some importance only in the beginning of the eighteenth century, when Dominico Michelacci introduced or perfected the culture of spring Wheat, ("grano marnolo") sown thickly, from which an excellent straw is obtained. The first experiments were made on the hills round Ligua, and their success caused this culture to be quickly extended to the neighbouring districts. Straw hats now formed the object of a rising but intermittent export trade.

About 1810 Signor Guisepe Carbonai, of Leghorn, having established himself at Ligua, and improved the manufacture, was the first to open out a trade with France and Germany. In consequence, the straw industry, which, till that, had been confined to the communes of Ligua and Brozzi, spread to those of Sesto, Campi, Carmignano, and Prato. Between 1815 and 1818 employment was given to some 40,000 persons, almost all women and girls, who earned from 1 lira 12 c. to 1 lira 68 c. per diem (a lira is equal to rather less than ten pence). Further orders from England brought the number of persons engaged in the industry between 1819 and 1822 to 60,000, the

best hands earning as much as 2 lire 24 c. per diem. America next came within the radius of the export trade, and more hands were required, so that not only the female population of several communes but even the men abandoned their ordinary occupations to work in straw. The number of persons engaged in the industry was at that time calculated at 80,000, earning, according to skill, from 1 lira 68 c. to 5 lire per diem. During these palmy days several new villages rose in the country district, and the increase of prosperity among the peasantry was general. The staple article of export was the "foretto," or broad-brimmed "flop" hat, known originally as the Leghorn hat—a name which, however, is now given to all hats of the same material and manufacture, whatever their shape or dimensions may be. The plait of which this hat was made was of thirteen ends, and the strips were knitted—"a maglia," as it is technically termed—i.e., sewn together without overlapping, so as to form a single piece. This method is peculiar to Tuscany.

From 1826 the demand for the "foretto" hat began gradually to fall off, and it was necessary to supply its place with another article. This was found in the eleven end plait, one strip of which, in making up the hat, was sown so as to overlap the other. The merit of introducing this plait was chiefly due to Messrs. Vyse, an English firm, first established at Florence about the year 1827. After some temporary changes the factory was finally removed to Prato, about the year 1844, where the centre of the business has ever since remained.

Messrs. Vyse opened various centres of instruction for the new work, and introduced into their factory machinery for the selection and preparation of the straw, &c. From this date the custom obtained of distributing to the plaiters the straw selected and cut by a machine and made up into bundles containing, in separate packets, the upper ends of the straw known as Tuscan ends ("punte"), and the lower ends, which are thicker and are termed "pedals." Hitherto pedal straw had not been used, but as the cost of the Tuscan ends was continually on the increase, a large demand arose on foreign markets for pedal plait.

Owing to the decadence of the "foretto" hat, the earnings of the workmen were greatly reduced, but about 1836 they were again able to earn 2 lire per diem, as there was for a short time, a renewed demand for this article.

In 1840 a large cone-shaped hat, called "cornetto" or "cappotto," was introduced. It was received with great favour abroad, as it could be adapted to any shape. This hat was largely made of Rye-straw, which is finer, more easily worked, and consequently, less expensive than the Wheat-straw, but not so flexible. In order to maintain the industry, however, new articles had to be found, such as plain plaits of fifteen and nineteen ends, pedal plaits of seven ends ("maglia" or corded), in imitation of the English plaits, and various kinds of fancy plaits. Straw stems were also woven with cotton, horsehair, and silk into braids or ribbons, either plain or fancy, according to the changing fashion.

The weaving of straw materials into braids and trimmings had existed in Switzerland from a remote date. The application of the loom to the weaving of the Tuscan straw into these articles was first adopted in England, where, for some two or three years, it received a very large development. The chief market for the sale of this manufacture was the United States of America.

Straw plaits in general are produced in all the country district round Florence, Prato, Ligua, Empoli, Pistoia, &c. Woven straw is made at Fiesole, where, of late years, a special industry of fancy straw baskets, fans, cigar cases, &c., has arisen.

The Leghorn hats are made nearly everywhere, but more particularly in the towns and villages lying near the Arno, to the west of Florence, such as Brozzi, Ligua, Empoli, &c. The best hats are said to be produced in the immediate neighbourhood of the capital city. Their price varies from 1 to 500 lire; hats, however, of the latter figure are now-a-days not often met with.

The qualities most currently in demand at the present time are the narrow-brimmed hats called "figliette," of coarse and medium assortments, running from ten to eighteen or twenty rows, and costing in first hands, when shaped and finished, from about 80 centimes to 2 lire each, according to quality and fineness. This is scarcely more than one-third of their

cost three or four years ago, when much finer, and consequently more valuable assortments were required, currently ranging from 8 to 20 lire each. The demand for this hat is continually declining, and, unless a change occurs, almost extinction is threatened, not so much from foreign competition at present, there being no foreign production of the same kind, as from their having gone out of fashion. But it is hoped that the article may soon regain favour on account of its many valuable qualities, which are stated to consist of the protection it affords from the sun, the lightness and strength of its tissue, the brightness of colour, the ease with which it can be adapted to various shapes, and its moderate price. All the hats are made of Wheat-straw; Rye-straw has ceased for some years to be cultivated for the purpose.

It is difficult to form even an approximate estimate of the number of persons, all women and children, engaged in the straw industry outside the factories at the present time. It must suffice to say that the industry is so generally extended throughout the district, that there is scarcely a family in which some of the members are not engaged in the work. Children begin to plait at five and six years of age, while mothers of families in addition to these domestic occupations, and females of all ages, and almost of all conditions, who do not follow the business as a means of livelihood employ their leisure time in it. Formerly, when the production was carried on by persons connected with agricultural labour only, the work was not constant, but now, excepting, perhaps, with a few "contadini" it goes on all the year round.

The plaiters work in their own homes, and their busy fingers are rarely at rest. The larger number work up the straw on their own account, and sell the plaits or hats on the public markets held at Florence and in other towns. Others receive the straw from, and are paid by the "lattorini," a class of middlemen who consign the plaits and hats in the rough to the principal manufacturers, who finish them for export. Others, again, are in direct communication with the manufacturers themselves.

The earnings of the plaiters are subject to considerable fluctuations, partly depending upon the market prices that may, from time to time, rule for the manufactured article, and partly according to the higher or lower rates of the straw. On an average, the daily earnings of children and of young girls may be taken at from 30 to 45 centimes, and of women at from 75 to 80 centimes. Much depends upon the ability of the workers, and a considerable number of expert hands earn regularly, under ordinary circumstances, from 1 lira to 1 lira 10 c., and sometimes as much as 1 lira 50 c. per diem.

The ordinary length of the plaits was 50 metres, but of late they have been made of 50 yards, as more suitable for the English and American trade. Those, however, purchased on the public markets are said to be very defective in measure. Whole straw is always used; it is never split in the Tuscan industry.

The articles chiefly exported are the Florentine hats, and plain and fancy plaits. The principal countries of export are France, the United States of America, Great Britain, Germany, and Austria.

The future prospects of the Tuscan straw industry are at present by no means encouraging, as so many new articles spring up which are more favoured by fashion. The plaits most currently in demand are the plain seven-straw pedal and the Tuscan ends, for which there appears the probability of a continued consumption, but the production is very large, and there is the risk that the supply may become in excess of requirement.

Fancy plaits have always been made of late years; the demand for them, however, is more or less brisk, according to circumstances.

The competition of English plaits, as far as prices are concerned (fashion apart) does not much affect the sale of Italian straw products, but that of the Chinese plaits, in the coarse qualities, is almost crushing, and to a very considerable extent now supplies the various markets of Europe and America to the nearly total exclusion of the same qualities of Italian plaits as regards foreign consumption. The Chinese plaits are of excellent quality, well made, strong, and serviceable, and supplied at prices with which it is impossible to compete in Italy. At one time the straw ready for plaiting was exported to England and Switzerland, but this branch of the trade has for some years entirely ceased.

A few years ago the export of the Florentine plaits

was estimated at from 2,000,000 to 3,000,000 pieces, but of late it has increased, and the export is at present calculated at from 6,000,000 to 8,000,000 pieces of 50 yards each. Except from Venice, no other real straw plait is exported from Italy. At Carpi, in the province of Modena, however, several firms are working in chip plait and hats, the export of which,

brought from Modena. As the object of the cultivator is to produce a fine long straw, and not a full crop of Wheat, all the usual conditions are reversed. Thus, a spring Wheat is sown in winter, a mountain variety on lowlands, the seed is thickly instead of thinly sown, &c. The thicker the seed is sown the finer the straw comes out.

ture also is carried on about Voltura, and is met with in some parts of the Mugello and elsewhere.

In the principal centres of cultivation straw is grown on nearly every farm. Plots of land are also hired at a money rent for this culture. The average quantity sown is from five to twenty sacks of seed, each sack weighing about 50 klog. This quantity, however, varies according to circumstances. The seed is sown very thickly towards the end of November or the beginning of December. The ground intended for this culture is dug up and manured in May, and generally sown with spring Beans and the like, which are often dug in. About October the ground is ploughed for sowing. At the end of May or the beginning of June following, when the ear is beginning to swell, the straw is pulled up by hand, a sunny day being chosen for the operation.

The straw is now made up into "bundles" ("manate" or "menate") containing as much straw as can be easily held in the hand. The bundles are tied up with Broom. The green straw is sold in this condition to the factors or speculators, who come round to the farmers to make their purchases. A crop is also occasionally sold standing. One hectolitre of such is estimated to yield on an average about 4000 "manate" of green straw. The cultivation of straw is considered to be more profitable than that of Wheat, but more hazardous, and once in six years the yield may be *nil*.

The next operation which the straw undergoes is that of being bleached, which is effected by exposure to the sun by day and to the dews by night. The "manate" are spread in a fan-shape on a bare river bank or other open space, which must be entirely devoid of vegetation. After four or five days' exposure the straw will have acquired a light yellow colour. The "manate" are now turned over and the under part exposed, in its turn, for three or four days more, when the straw, after being well dried can be gathered in. When the dews are light the process is slower but more perfect. In case of rain, the straw must be at once heaped together, and covered over to prevent its being spotted.

The straw is now ready for manufacture, the first operation of which is the "sfelatura," or unsheathing the ends of the straw, leaving only the inner portion to be worked up. This is generally done by children. The ends are sold for forage at the rate of 5 lire per 1000 "manate."

When unsheathed, the straw is carried to the factories. After having been slightly wetted it is first exposed to the fumes of sulphur in a tightly closed room, thus acquiring that light sulphur colour which is characteristic of Florentine hats and plait.

The straw has next to be sorted according to its different thicknesses. This is done by means of an apparatus, which consists of a series of vertical metal cones placed on a stand in a double row, and provided with movable copper plates ("sistole") perforated at their lower ends. The holes in each succeeding plate are a size larger than those in the preceding one. The numbers generally range from 0 to 13, but sometimes they run up to 20; 0 represents the finest stems. A bundle of straw being placed in the first tube of the series, a saltatory movement is given to the machine by means of a combination of cog wheels, generally worked by hand. The finest straws pass through the holes of the plate, where they are suspended by the ear. The larger straws are then put into the next tube, and so on, until the whole is assorted, a constant supply being maintained. The sorted straws, which have passed into the holes up to the ends, by which they are suspended and prevented from falling through, are then drawn out by the ears and placed in separated receptacles.

The first thing after assorting the straw is to cut off the ears, an operation termed "spigatura," which is done by a special machine. Then follows the "spilatura," or assortment into lengths, which is effected by placing on a table a small cylindrical tin case, open at both ends, and about 3 inches (20 centimetres) in height, and the same in diameter, more or less, into which a loose bundle of the prepared straw is placed vertically. The operator sweeps his hand over this bundle and draws up from it the longest straws, which project above the rest. These he deposits in the first compartment of a table furnished with different divisions. He then draws from the bundle the next longest straws, and so on until he comes to the shortest. Usually, the straw is divided into five or six lengths for the finer kinds. The straw is of a better colour, more

FIG. 96.—GREVILLEA SULPHUREA: HALF-HARDY EVERGREEN: FLOWERS PALE YELLOW. (SEE P. 468.)

for a good year, may be taken at from 2,000,000 to 5,000,000 pieces.

The seed used for the cultivation of straw is carefully selected with regard to the nature of the soil in which it is to be sown. The quality employed is always a variety of spring Wheat (*Triticum aestivum*). For the lighter soils seed from Mount Amiata, near Santa Fiora, or from the mountains of Radiconfi, in the province of Siena, is preferred; for the heavier lands the "semone," grown on the Pisan hills, near Pontedera, is selected. Seed is also said to be

Straw is largely grown about Campi, Sesto, and Prato, in the plain between Florence and Pistoia, diminishing in quantity in the neighbourhood of the latter city. The cultivation is important between Florence and Empoli, principally on the south-west side of the Arno in the plain, and on the hills commencing in the vicinity of Luga. It extends into the country round within a radius reaching to and beyond Empoli, of about an average distance of 15 miles from the Arno, including within its range San Casciayo and Castelflorentine. The cul-

consistent, and finer as it approaches the ear, the lower part, which has been protected by an outer covering, being whiter and softer.

Formerly this end was not used, but now it is employed for making all the articles that go under the names of pedal hats or pedal plaits. The sorted straw is now made up into small bundles, which are bound together in a large packet, the points, or upper ends being placed upwards in two bundles and downwards in the other two. The united packet is now laid under a cutter, and being divided through the centre, yields four smaller packets, two of point and two of pedal straw, which are ready for the plaiter. The straw is given out to the plaiters, either directly from the factory or through a factor, in bundles, either sufficient to make a length of 50 yards of plait or a hat, as the case may be. Before being plaited the straw is slightly wetted, to render it more flexible. The hats are sewn either with waxed thread or with the fibre of a Rush which grows on the marsh lands near Ligua, and which is prepared for the purpose. On the plaits being returned to the factory they are measured. The length being found correct they are washed in potash water, in order to whiten them. Occasionally they are cyandered to give them a polish. They are next wound upon a circular toothed frame of one metre in circumference, the teeth being to keep the strands of the plait evenly over the other. They are made up into packets of six or twelve pieces, and lately of twenty-four pieces, after which they are packed in cases for export.

On the hats being brought to the factory the loose straws are first cut from the brims, and any defects in the plaiting are made good by insertion, after which they are piled up on one another and placed in large troughs full of potash water, in which they are pressed down by planks. They are then dried in the sun, when the weather is fine, or in hot rooms in bad weather. The hats are now ready to be moulded into shape, which is effected by their being placed in heavy zinc moulds and forced into shape by hydraulic pressure. They are next powdered with sulphur and polished with a small wooden instrument, and may now be packed in cardboard boxes in dozens, and subsequently in wooden cases ready for export.

Hats are also made in the mountain district of common Wheat-straw. Formerly, and up to the last two or three years, the export of these hats to America was extremely large; but since then the demand has been rapidly falling off, and has now become quite insignificant, the cause being chiefly attributed to their having been superseded by the Chinese plaits and the Yokohama, Maracaibo, and other hats, which, some for price, and others for quality, have now, to a great extent, the preference. The prices of the mountain hats range from 10 to 30 lire per 100, according to their fitness, quality, and dimensions.

HOME CORRESPONDENCE.

Grapes.—In reply to "J. S." (p. 442, last week's issue), I would advise that the Golden Queens be grafted with either Black Alicante or Gros Maroc of black kinds. These varieties would form a capital succession to the Black Hamburghs, and should succeed well on a vigorous grower like the Golden Queen as a stock. Of white kinds, if Foster's Seedling is not already grown, by all means give it a trial, also Mrs. Pearson. I have seen the latter kind doing well with Hamburghs. If both of the above white kinds are grown already, I would advise Buckland Sweetwater rather than thick-skinned white kinds; but why not introduce a rod of Muscat of Alexandria? I have it doing well with Black Hamburgh, Madresfield Court, and Gros Maroc. *Vitis*.

Primula Raising.—To avoid any misunderstanding of Rev. M. E. Webb's remark in last week's paper (p. 406), I beg to state, that as a rule, I sow Primula seed either immediately it is ripe, or, at all events, from January to June, but not from June to December; our climate forbids doing otherwise. The seeds are not covered at all, or only very thinly if they are large, but the seed-pans are covered at once by a white lime-painted pane of glass to retain evaporation; and, besides, if sown any time later than February, they must have no sunshine. If after a few days it is possible to expose them to a gentle rain, they will come up rapidly; but if rain is wanting, germination, as far as my experience goes, is very uneven, and takes as long as three weeks. When the rootlets appear, I cover them slightly by

passing some sandy soil through a fine sieve. They are then eight days afterwards pricked out, the plants being taken up with small pinners. If after three weeks the seeds have not germinated, they have either lost their germinating power or they belong to a certain series which by their nature want to lay in the soil exposed to all weathers if possible for at least twelve months; to keep these in an equal medium during the summer months I cover the seeds by 1 inch of pure white sand, and on this 1-inch of lateral *dréna*, plunging the pan into a bed of the latter material. Late in the autumn the charcoal and sand are removed and the seeds then germinate on a greenhouse shelf in January or in the open air more plentifully in March. We have still much to learn as to the conditions under which germination is best effected. *Max Leichtlin, Baden Baden.*

Book on Church Decoration.—In your answers to correspondents, p. 442, you inform Miss H.— that you do not know of any book on church decorations. I beg to inform Miss H.— that she can get a very good book, illustrated with church designs, &c., published by *The Bazar Office*, 179, Strand, W.C. The price of the work is 1s. *W. M. Giddes, Shroppton, Dorset.*

Gunnera scabra.—Your reference to this noble plant at p. 424 induces me to mention how wonderfully well it seems to thrive in all parts of the Channel Island. During a recent visit to these interesting islands with some kindred spirits we noted several plants with enormous leaves; especially grand were some plants growing by the side of a lake at Roselle, near the seat of the Rev. Wm. Lempriere. Of a still more remarkable character, however, is to be seen, near Moulin, Huët Bay, Guernsey, a great mass of Gunnera some 200 yards long and 30 feet in width, that is choking up the course of a small stream on the mountain side, and become "perfectly wild." These plants are, at all events, quite "at home," and growing most luxuriantly. In the distance this looked like a mass of huge Burdock!—some of our party said Rhabarbar! No one expected Gunnera in such a situation. *A. F. B.*

Fuchsia corymbiflora.—I notice that Mr. Murphy, Clonmel, has drawn attention to this old favourite flower, and inquires as to where it is grown. I have often been surprised that it is not more generally found in collections. I have in a large course of observation only known it in one garden in Scotland, viz., at Panmure, Fife-shire. This plant was planted in the greenhouse there shortly after the garden was made in, I think, 1855, by the present gardener, Mr. Mitchell, and when I visited the garden about forty years ago it was in vigorous health. As this may be one of the oldest plants in the country, if it is still growing, I think it well to note it. Perhaps Mr. Mitchell can correct me if I am wrong as to its age. *C. S. F.*

Asplenium germanicum.—Concerning this species about which information is desired at p. 436 of the present volume, I may state that I have specimens collected from cultivated plants ten or twenty years ago bearing abundance of spore. The fronds are 5½–6 inches long, with seven pinnae and the larger terminal lobed segment. The plants were grown in pots in a cool fernery along with the finer and rarer of British Ferns together with many half-hardy or greenhouse exotics, and received no special treatment. No importance was attached to the growing or fruiting of it, nor did it seem to present much difficulty beyond the matter of slow growth. A septentrional form of the same conditions was about 1 inch shorter, and also well fruited. Being a small, and to the general public not very attractive plant, it is seldom cultivated except by those who make a speciality of hardy British and other Ferns. It is one of the rarest of British species, and only occurs in Wales, the North of England, Roxburgh, Perth, and Fife. Some of the other species mentioned are abundant in Britain, in various districts. *J. F.*

Grapes at the Last Meeting of the Royal Horticultural Society.—In last week's *Gardener's Chronicle* "M." seems positive that the Mrs. Pearson shown by me at South Kensington are not Mrs. Pearson, but Royal Vineyard. I will ask him to look in the Answers to Correspondents of the *Gardener's Chronicle*, September 5, 1885. There he will find your answer to the berries (from the same Vine) you kindly named for me. One of the Grape judges at the Crystal Palace show, September, 1885, also told me it was Mrs. Pearson, *T. Oman, The Gardens, Otterham Park, Chertsey.*

—Under the above heading in last week's issue, p. 449, "M." has given the information that the 1st prize Mrs. Pearson's were Royal Vineyards. I certainly had the suspicion that they were not what they were shown for, but Royal Vineyard did not occur to me at the time. The only time I saw the latter Grape was some years ago, and

then it was confined to a limited space at one corner of a viney, the grower evidently being very chary of permitting its extension. How about the award of the judges. Their decision is supposed to be "final," but should it be so in such cases? We think not. Neither ought the awards to be "final" in the case of "made up" bunches when detected and protested against by exhibitors who show straight, as was the case at the Crystal Palace show on Sept. 3–4 last. *Vitis.*

Pampas-grass (*Gynerium argenteum*)—The graceful plumes of this grass are now at their best condition. Those who value these should lose no time in cutting any that may be required for winter decoration before the autumn fogs mar their beauty. This is soon the case in the vicinity of towns and industrial centres. *J. H.*

Aster and Stock Seed Growing at Forest Hill, London.—I can, with your permission, confirm the views expressed by your correspondent, "R. D.," p. 435–181, as to the quality of the bloom, and, 2d, as to the seed. I have seen the seed strain, from many years' experience, then referred to. I brought a number of my gardening friends out there the last week in August, to see the Wheat and Tobacco experiments, but especially the annuals grown for seed and show. The Asters, especially the quilled German, were then very fine—so good, indeed, that at the meeting of the Royal Horticultural Society the following day (24th, I believe) a large collection received the highest award. I cannot see how Germany could be expected to produce a finer strain of these or other annuals than England, for seed purposes. *W. J. Murphy, Clonmel.*

Tecoma radicans var. grandiflora.—The racemes of *Tecoma radicans* now in abundant flower, and supposed to be the Japan species, *T. grandiflora*, are taken from a large specimen covering a portion of the south-east wing of the house at Bayfordbury, to the height of about 25 feet. It was planted out from the conservatory to test its hardiness more than twenty years ago, and has but proved the severity by many hard frosts, but flowering annually, but better than in the present season. *W. R. B.* [No doubt your plant is *Digonia grandiflora* of the *Bot. Mag.*, t. 1398. Ed.]

Blue Hydrangea hortensis.—A great uncertainty seems to prevail with regard to the date of the introduction of this plant to Britain, as to the uncertainty of producing blue flowers at a given time with any degree of certainty. Dates assigned for its introduction are 1740, 1788, and 1790, in as many different books. In all probability, however, it was first introduced to Kew in 1790 by Sir Joseph Banks, and a figure is given of it in the *Botanical Magazine* in an early number, t. 438. Its capricious nature with regard to the coloration of the flowers was observed and recorded as early as 1796, when a plant produced blue flowers, although it had flowered the previous year in the same pot exhibiting the normal pink flowers only. The opinion is sometimes expressed even now that if any one could discover a method of treatment to induce a plant to flower, exhibiting the blue colour with any degree of certainty, he would soon acquire a fortune by taking his plants to Covent Garden Market. It seems rather paradoxical in these days of experiment and resource that some expedient in the manner indicated has not apparently been attempted on any extensive scale. Some kinds of peat earth are said to produce the blue colour, as well as turf-ashes, but especially the ashes of *Ficus excelsa* and that of woods generally. The yellow loam of Hempstead Heath is said to produce the same effect, and the pre-coloured earth found under the peat on moors. A year or two ago, plants in pots at Kew watered with a weak solution of alum-water, exhibited flowers with the unmistakable blue tint, although not very intense. In the open air the normal rosy-pink prevails, as well as at other places in the vicinity of London where the Hydrangea is planted out. In the neighbourhood of some parts of the Grampanns, where the Hydrangea is grown in pots, the desideratum is not to get blue but pink flowers. The cottagers who grew the plants attributed the blue colour to the soil, because plants obtained from sources producing pink flowers afterwards produced blue ones. The soil in that neighbourhood would be peaty, and probably contain more or less iron, and where cultivated is heavy or even clayey. Probably the most handsome plants coming from my observation were those planted in gardens between Swasey and the Mumbles. The huge bushes were a mass of flowers, exhibiting various tints and hues, ranging from green and pale pink to deep rosy-pink, and pale to deep blue, all on the same plant or bush. The species also produces blue flowers naturally in the open border or shrubbery at Normanhurst, in Sussex. The contrast of pink and blue is not only interesting, but of great value horticulturally, and might be turned to more practical account at present it is. Any one with moderate means at command might, by a few

carefully conducted experiments, discover some practically useful method of producing with a moderate degree of certainty the desirable blue colour, which would have all the value of a very distinct variety. Seeds are by no means readily produced by this species, but something valuable might be accomplished by seed sowing and selection. J. R.

The Bradford Gardeners' Mutual Improvement Society.—A meeting of the above Society was held at Bradford, on Tuesday last. Mr. G. Elliot, of Huddersfield, spoke on the prospects of the Society and its usefulness to gardeners by enabling them to meet together and exchange ideas. Mr. Barnshaw read a paper on Eucharis amaranzica, which raised a warm discussion as to the most successful way of flowering the plant. Mr. F. Newman, G. to E. Salt, Esq., Fernie-chant, explained the various experiments he had made to eradicate the so-called Eucharis mite—efforts that have proved successful beyond his expectations, so that his fine specimens of Eucharis, Amyrillus, Nerine, Griffonia, &c., are in the best possible condition. [Will Mr. Newman kindly publish his method. Ed.] The meetings are held fortnightly, and several members have promised to read papers on various subjects. Mr. Thos. Horsman, nurseryman, Bradford and Ilkley, has generously offered a prize of £1 10s. to under-gardeners for the best paper on the culture of Tea Kises in pots under glass. The Society is being taken up with great spirit by the gardeners in the neighbourhood, and there is no doubt that some very enjoyable and instructive evenings will be spent during the coming winter months. A Member.

Cedar at Bretby Park, Burton-on-Trent.—In reference to your remarks at p. 407, I wish to state that the girth of our Cedar at 5 feet from the ground is 16 feet 6 inches, and the height is 90 feet. Geo. Brant, Gv.

Market Prices.—Your article on the competition in the flower and plant trade by foreigners should attract the attention of the trade, all of whom are sufferers thereby, and stimulate them to make a firm stand against the free importation of foreign-grown goods. Shall we stand silently by and see our trade annihilated by men who do not contribute one penny towards the taxation of our country, while we are taxed to the extreme limits? Can it ever have struck our rulers, as it has done me within, I am ashamed to say, the last few years (I was a Free Trader till then, because I had never looked into the subject), to look upon our country as a large trading firm, in which we are all partners in different degrees, and that every pennyworth of goods we can produce in the firm, and by some members of it, and which we now import, and so pay the money out of our firm to a foreign firm, no matter what the cost of producing by our own firm might be, is a dead loss to us. Let us suppose that an article which could be bought from the foreigner for 5s. could not be produced in the firm, yet surely if the 5s. goes to another firm, ours is that amount poorer. Well, this process is going on to the tune of something like £140,000,000 a year, £100,000,000 of which we could produce in our own establishment. If there was an import duty on all manufactured articles and those brought here ready for use, this £100,000,000 would be circulating among the members of our own firm. What matter if the labourer did earn £2 a-week instead of £1, he would want better clothes for himself and family, better food, house, and education for his children, and he would be able to pay for it; for would not the farmer cultivate every inch of his farm? The master and his men would want more goods from the town shopkeeper, they in return would want from the manufacturer; there would be no complaining of dulness in trade, for would not our firm be £100,000,000 better off every year from the goods produced in it? It would ask for no such business have we to keep foreign workmen employed, while our own members are begging their bread? We have the labour and the land both now running to waste. Surely soon, as a nation, we shall see that this so-called free trade is working ruin to ourselves, throwing land and gardens out of cultivation, and making it worthless. If the forthcoming Horticultural Palace Company, of which I saw a notice in the *Gardener's Chronicle* of the 19th ult., becomes a *fait accompli*, I hope I may be the means of forming a centre round which the trade may rally and make their importance felt. *Edward Collins*. [We do not believe that taxation of the food of the many, for the advantage of the few, will commend itself to our rulers while population is increasing at its present rate. Ed.]

Autumn-flowering Amaryllis.—Those two very charming varieties, Mrs. William Lee and Mrs. Garfield, are now to be seen in the Victoria Nurseries, Holloway. These two forms originated from a cross between A. reticulata and one of the fine spring-flowering varieties, the former being the seed parent, with the happy result that there has been

obtained a race of autumn-flowering types, with flowers of large size. Both those named have the colour of pink prevailing, the habit being that of a reticulata. There is no reason why, in course of time, there should not be a number of autumn-flowering forms rapidly approaching in size and form the superb blossoms of the spring flowering types. R. D.

Mulberry with Dimorphic Leaves.—A large lower limb was cut from an old Mulberry tree here a year ago, at about 3 feet above ground level. This year shoots bearing deep cut trilobed leaves have been produced from the margins of the old scar or wound. These cut leaves remind one of those of the Paper Mulberry (= *Broussonetia papyrifera*) rather than as belonging to the typical *Morus*. It would be interesting to know if seedling Mulberry trees have entire heart-shaped or lobed leaves. Herewith I send you specimens of the two kinds of leaves, and it would be interesting to hear if such a marked case of dimorphism has been observed before. F. W. Burdick, Trinity College Botanical Garden, Dublin, Sept. 27. [The occurrence is not unusual, and is observed generally on trees that have been cut down to within a short distance of the soil. It is frequent in Acer and Quercus. Ed.]

—Since writing on the above Mr. Robert Lindsay, Curator of the Edinburgh Garden, has called here, and he tells me that seedling Mulberry plants have deep lobed leaves, similar to the specimens of the reversion from the normal cordate and entire foliage as sent to you. I also further notice that a few of the stem shoots of the white Mulberry, *Morus alba*, are also lobed in a similar manner, these shoots likewise springing from old scars made in pruning the stem or bole from time to time. The facts of the cases above alluded to are plain, but at present it is not so clear why *Morus* leaves gradually change from the lobed leaves of the seedling to the entire heart-shaped stage, and then and then revert to their original form, while *Broussonetia* retains its cut leaves altogether. Does *Broussonetia* ever produce entire foliage? F. W. B.

Herbaceous Plants.—In most cases in which the term herbaceous is employed in flower show schedules it is intended to have a wide application, and is perhaps used because those who construct schedules forget that herbaceous does not mean perennial. Because of this intention, which is seldom clearly expressed, judges usually admit into the class for herbaceous cut flowers all kinds of hardy perennials, even including flowers from shrubs, such as Roses, Camellias, Azaleas. If in the future terms were always employed which really conveyed clearly the precise intentions of flower show committees, much grumbling and quibbling might be saved. I think it would be a rare circumstance were any stand of twelve kinds of herbaceous flowers so-called shown to be truly such. Almost invariably some hardy perennials are included, and with the majority of judges these would pass muster. In some few cases there may be disqualification, but only where, to use an old phrase, "the letter killeth." A rigid adhesion to the letter too often but ends in harshness, and in an interpretation never intended. In our courts of justice judges are often called upon to interpret Acts of Parliament which seem difficult to construe, and as a rule their construction is accepted as good law. In the same way, where judges have time after time construed the term "herbaceous" to mean "perennial" also, it seems undesirable that such judge-made law should not be universally accepted and adopted. A. D. [The judges should carry out the letter of the schedule as exactly as possible, and leave the committee to exercise the functions of a Court of Appeal, and temper law with equity if they think fit. Ed.]

Spiranthes Romanzoviana (the Lost Irish Orchid).—When I was a very small boy in a very small village in the west of Ireland, I had an instinct for making friends with all the "wise" of the place. One of them, an eccentric old French clock-maker, musician and mender of all things worth mending to boot, used to say—"Come to see me little man at every times you like," an invitation of which I made the most, and so learned many things I should not like either to "cease to remember" or to forget. When I did my best to relate to him the village gossip, he, good man, with his sixty years' experience of the world, would laugh—"Ah! you tell the truth, but, *mon ami*, *tantôt*, there is a—a behind;" and then he would tell me the causes of the results which had startled me. Now I wish to tell my good and valued friend Mr. A. D. Webster that he has told the truth, but not the whole truth about my living specimen of this curious Irish Orchid. There is a "behind." True, they were known away by an under-gardener, who had a bad time when I discovered it, and who tried to assure me that there was nothing but a sod of grass in the pot. He knew nothing of the "behind" so interesting to me beneath the sod. He, and others, and myself, raked over the

rubbish heap and I kept my eyes on it for days, but no signs of the sod were seen, and finally I gave up the quest as hopeless, and thought no more—that is, I tried to think no more—of the matter. This was in October, after the leaves had died down. In the February following I was walking round the garden one quiet warm Sunday morning when *Crocus* gleamed in the sunlight, and the thrushes were singing on every bough. Passing one of the Five Pines surrounding the rubbish yard, out flew a blackbird, a fine glossy fellow, with a beak of gold. Ah! thought I, "you are early with your nest," and I parted the dense mass of growth to see into the centre. There was no nest, but there, in the hedge, rested a sod, brown and dry. I thought nothing of my loss, but curiosity prompted me to pull it out, and then a lump came into my throat as I parted it and saw the white tubers quite safely enclosed therein. In a word, my pet Orchid was found again, and, like the lost sheep, or the piece of silver, was loved and cherished more than before. It is now safe here, and this season bore two strong growths, although it did not bloom. My best friends tell me I am an optimist, and so far as this applies to the above sweet little Orchid I own to being an optimist of the first water. I happen to enjoy the friendship of one who has collected *Spiranthes Romanzoviana* at Beathaven, and he assures me that where it was found by himself neither *Botanica* nor *Oats* could possibly thrive in a word, neither he nor I really believe now that this delicious little Orchid is really "evicted" from at least one of its Irish habitats. The plant is not at all difficult to cultivate in a sod of moist soil, and even if thrown away as mine was, it may possibly turn up again alive after many days. Next flowering season—say July or August—I hope to make an especial pilgrimage to see for myself if this rare plant is really evicted or not, and I should be very glad if Mr. Webster would be in the way in the search. In the meantime I hope Mr. Gombleton and his friends will keep their minds on the question, and do their best to preserve to us the "Irish Lady's Tresses," as his *Spiranthes hibernica* is popularly called. If things come to the worst—that is, if it is really and thoroughly destroyed, which I do not as yet quite believe—well, then, we must import tubers from America, and try our best to establish or naturalise them again in Ireland. F. W. Burdick, F.L.S.

Begonia Princess Beatrice.—In his almost unrivalled flower garden at Heckfield Place, Mr. Wildsmith, who is constantly providing some floral surprise for visitors, has a striking one this season in this charming mule hybrid *Begonia*. He has used it largely as a "dot" plant, placing it in the middle of a pretty panel of some dwarf growing *Sedum* or kindred mossy plant, and there it is flowering with marvellous profusion. It does not trouble itself about the production of seeds, being a sterile, and therefore its gametes and does devote its whole energies to the development of blossoms. It may interest some to know that this is one of Messrs. Sutton & Sons' novelties, that it resulted from *Begonia semperflorens* × *B. Schmidtii*. It is exceedingly free-flowering, and opening white then changes to delicate salmon. It may be said to be a continuous bloomer, and plants that have been in the open ground all the summer flower all through the winter if they are lifted from the open ground and placed in pots in a warm house; and under glass the blossoms are nearly if not quite white. Now that *Begonias* are becoming such favourite bedding plants, *Princess Beatrice* should be looked after. It is of medium compact growth, and in point of habit a model bedding plant. A large patch of it at Reading is worth going some distance to see. R. D.

Rubus phenicolasus.—(See illustration of S p. 468 in p. 365).—This is one of the handsomest species of *Rubus*, and as such deserves to be generally cultivated, and to have a good position in the garden. I have never seen it finer than in the temperate-house at Kew, but here it does extremely well against an east wall, and seems with that amount of protection to be perfectly hardy. One plant I have in the open, four years old, has not yet been injured. The old canes that have fruited should be cut away on the principle of Raspberry culture. It grows fast, and is easily raised from seed. Another scented-fruited species I have, *R. parvifolius*, is even still finer and bolder in fruit than *R. phenicolasus*, but the plant is not so handsome, as the reddish glabrous hairs are wanting. The carpels are large, of rusty colour, and glistening like stained glass. This does extremely well in the open bed, and fruits freely. R. J. Lynch. [The plant is growing vigorously, and bearing fruit on the northern slope of the rockery at Messrs. Paul & Sons' nursery at Brockbourne. Ed.]

Bees and Colour.—In last Saturday's *Gardener's Chronicle* "J. F." says—"It is asserted by many that colour has no influence on bees—that, in fact, they are colour blind," while others assert differently, and that they have "no preference for flowers of any particular hue." The fact is they visit flowers to

obtain honey, and no doubt have, very sensibly, a preference for those that produce the most, quite regardless of colour. A fact not generally known, but proving the wonderful instinct of bees, is that they collect from one description of plant or tree only at a time. Thus, from Mignonette, Lavender, Thyme, Heath, or Lime tree. Some bees collect from one sort and some from another. They doubtless discern colour, as their sight is particularly sharp, but it is their exquisite sense of smell alone that serves them in collecting honey, as is proved by their never visiting unmelliciferous flowers of any hue, and from their collecting it, as they do, in large quantity from two small glands near the foot-stalk on the underside of Laurel leaves in spring, when flowers are scarce. There is no fear that the food of bees will run short in country districts as a constant succession of flowers from early spring to late in autumn will always afford a good supply. Light hives are occasioned most frequently by late swarming, cold wet seasons, and bad management. *W. H. K.*

WINTER CABBAGE LETTUCE, BUTTERHEAD.

THIS new kind of Lettuce, large, light green, and compact, which during the two years it has been cultivated has proved to be perfectly constant and hardy, is the best sort of winter Lettuce, and which, according to the statement of the raiser, M. Paul Neidhardt, of Erfurt, excels all other winter kinds at present in the market, owing to its early ripening, long duration, firmness of head, large size, crispness of leaf, and delicacy of flavour. Even when exposed to continuous heat it forms compact and firm heads, which, when the plant is liberally manured, will attain the enormous weight of 1 lb. each. All parts exposed to the sun's rays are of a light green colour, whilst the interior leaves are of a golden yellow. This "Butterhead" cannot be strongly enough recommended to all such as delight in an early and delicately flavoured Lettuce. It produces very little seed.

Reports of Societies.

CRYSTAL PALACE: October 6—9.

THE customary exhibition of hardy fruits, vegetables, and Gourds, took place on the above dates, when a very fair collection of all kinds was brought together, but the absence of the Potato, which figured so imposingly at many previous shows at this season, considerably reduced the extent of the display. The unfavourable dryness of the season in the eastern and southern counties, from which the main quantity of fruits are supplied, appears to have told on the Peas, these fruits having a want of finish and size in several collections from localities whence in other years some of the finest specimens have been drawn. The first place for Apples and Peas fell to Kentish growers, the examples shown by Mr. Butler and Messrs. G. Bunyard & Co. having been rarely excelled.

COLLECTIONS OF APPLES (OPEN).

Messrs. G. Bunyard & Co., the Old Nurseries, Maidstone, took the 1st prize with 130 dishes, consisting of the leading kinds, of which we may mention, as being of exceptional merit, the following:—Melon, a delicious, melting, medium-sized dessert kind of a high order; the Queen, Alexandra, Warner's King, very large; Cox's Orange, of half a pound weight each; Lady Henniker, Golden Noble, the new kind—Sandriogham, Beauty of Kent, Premier, of a bright crimson hue; very large Old Non-such and Claygate Pearmain; New or Winter Hawthornden, and King of the Pippins. The 2d prize fell to Mr. Watkins, Pomona farm, Willington, Hereford, for fruit generally of a large size and high colour, very fine being Cox's Pomona, Winter Hawthornden, Duchess of Oldenburg, Peasegood's Nonsuch, Calville Rouge, Gloria Mundi, and Emperor Alexander; 3d, Mr. C. J. Sclater, Birchey Barton, Heavitree, Devon, in whose lot we noted the Cornish Gilliflowers, Summer ditto, Cornish Aromatic, Court Pendu plat, Great Sultan, Gloria Mundi, and numerous sorts besides, which are but little known or grown out of the county; 4th, Mr. D. C. Powell, gr., Powderham Castle, Exeter, with a smaller collection than the others, but consisting of kinds well grown, and excellent.

The next competition (amateurs) as regards numbers was that for twenty-four dishes, in which Mr. Edwards, took to H. Higgins, Esq., Shinghill, Hereford, took the 1st prize, very good examples being found in White and Red Castard early kinds; Alexandra, Potts' Seedling, Peasegood's Nonsuch,

Alfreston, Worcester Pearmain, Wellington and Warner's King, the whole collection being undoubtedly one of the finest as regards size of fruit, freedom from blemish, and colour. Mr. S. Ford, gr. to L. A. Wallace, Esq., Leonardlee, Horsham, was 2d, and having good examples of Emperor Alexander, Rambour France, Red Hawthornden, Golden Reinette, Peasegood's Nonsuch, and Red Devonshire, a fruit similar to Quarrenden in colour but not in form. Mr. Waterman, gr. to H. A. Brassy, Esq., Preston Hall, Aylesford, was 3d, with many fine fruits from cordons and standard trees, the specimens of Ilbenheim Pippin, Alexandra and Peasegood's Nonsuch being especially so.

Twelve dishes of Apples.—1st Mr. W. Jones, gr. to J. R. Brougham, Esq., Wallington Bridge, Carlsholm, whose specimens of King Pippins, Washington, Ribston, Dutch Codlin, S. Jact Nonpareil, Blenheim Pippin, and Wellington were very fine, 2d, Mr. W. Jacob, Pound Street, Petworth; 3d, Mr. C. J. Goldsmith, gr. Kelsey Manor, Beckenham. In this class six other collections were shown.

COLLECTIONS OF PEARS (OPEN).

Mr. J. Butler, gr. to A. J. Thomas, Esq., Orchard Lane, Sittingbourne, Kent, was 1st with 96 kinds, gathered mainly from bush and cordon trees. Some of the specimens were of great size, notably Pitmaston Duchess, of 20 oz. each; Doyenné Boussoch, Duchesse d'Angoulême, Williams' Bon Chrétien, Louise Bonne de Jersey, of beautiful tints; Doyenné du Comice, Conseiller de la Cour, as showing the effects of soil and climate. As all were from the open ground, this exhibit deservedly met with much notice. The next best collection was that from Messrs. T. Rivers & Son, Sawbridgegorth, consisting of fruits from trees growing in many instances in pots, therefore affording excellent evidence of the adaptability of the Pear to this mode of growing fruits. Several of Mr. Rivers' seedlings figured in the collection, as yet without

FIG. 97.—WINTER CABBAGE LETTUCE, "BUTTERHEAD."

names, of whose quality we are yet unable to speak, but in size and appearance they are highly ornamental. Other known kinds of large size were Marie Louise d'Uccle, Beurré Diel, B. Rouge, Durondeau, Duchesse de Mouchy, Beurré Alexander Lucas, Rivers' seedling Bergamotte, Marie Benoist, and Pitmaston Duchess. Mr. Waterman took the 3d prize, with a collection consisting of many fine examples, but lost place by putting up several dishes of small specimens. Messrs. G. Bunyard were 4th in this class, with seventy-one dishes of average merit.

Twelve dishes of Peas (amateurs).—Mr. S. Ford was 1st in this competition, the examples of King Edward, Beurré Bosc, Marie Louise d'Uccle, Vicar of Winkfield, Duchesse d'Angoulême, and Marie Louise being his best. 2d Mr. Waterman, whose fruits of Brockworth Park, Gansel's Bergamotte, Durondeau were exceedingly fine; 3d Mr. W. Neighbour, gr. to G. Wythes, Esq., Bickley—nice specimens, clear in the rind and of fair size.

COLLECTIONS OF VEGETABLES (OPEN).

With vegetables generally no fault could be found unless we take exception to the enormous size of the Cauliflowers, and the length of the Parsnip tails; Mushrooms were poor, but then few gardeners have places in which to grow these esculents cool enough at this season to suit their needs. We think exhibitors should endeavour to show more varieties of such Peas as are found to succeed well late in the season, for Peas were notable for their infrequent appearance in the collections, and as there is no rule to exclude more than one kind it would be an advantage to the craft to see more varieties on the show table.

Mr. Waterman was placed deservedly 1st with the extraordinary number of ninety-one sorts and varieties. Beans, both Runner and French, Celery, Carrots, Potatoes, Savoy, Brussels Sprouts, Cauliflowers, were fine and large; we also remarked four kinds of Tomatoes, four of Potatoes, four of Onions, and the

same number of Capsicums. Herbs, Spinach, salad, were all abundant and good. Mr. Wythes, gr., Bickley Park, Chislehurst, was 2d, with an almost as good a collection, the Cauliflowers, Leeks, Cabbages, Potatoes, Onions, and Maize being everything that could be desired. 3d, Mr. W. Mast, "George and Dragon" Hotel, Igham, Kent—the Tomatos, Brussels Sprouts, Cauliflowers, Globe Artichokes, and Beet-roots being especially fine.

Twelve dishes of vegetables (amateurs).—Mr. Waite, gr. to Colonel Talbot, Glenhurst, Esher, was the winner of the 1st prize in this class, the items shown being good, as we always remark as coming from Glenhurst. They consisted of the following:—Celery: Major Clarke's; Leek: Sutton's Prize, large and thick; Beans: Carter's Champion Runner; Carrots: Sutton's New Intermediate; Fennel: Snowdrop; Tomatoes: Sutton's Perfection; Cauliflowers: Veitch's Autumn Giant; Beet: Fragnall's, than which there is none better; Onion: Anglo-Spanish, a strain of white Spanish, but larger than the type. The rest was made up of a few smaller things. Mr. J. Neighbour took the 2d prize; 3d, Mr. Waterman.

Six dishes of vegetables (cottagers).—Mr. W. Thayne, New Town, Crawley, took the 1st prize; Mr. E. Hall, 71, Great Queen Street, Dartford, 2d; and Mr. Beckett, Tyler's Green, Amersham, the 3d. There were three other competitors.

The heaviest Gourd was shown by Mr. J. Radbourne, gr. to Baroness Heaton, Coombe House, Cropton, and weighed 139 lb.; the 2d best by Mr. G. Sheppard, Fulbrough, Sussex, with Daniel's Yellow Mammoth, weighing 119 lb.; 3d, Mr. W. D. Cochrane, Fortune Green, Hampstead, with one of 101 lb.

Mr. Dance, gr. to Colonel Lowe, Gosfield Hall, Essex, took the 1st prize for a nice collection of ornamental Gourds; and Mr. Osman of the South Metropolitan District Schools, Sunon, the 2d prize, for a most equally interesting exhibit.

MISCELLANEOUS.

Messrs. J. Veitch & Sons, Chelsea, showed a collection of fine Peas, numbering sixty dishes, and a large collection of culinary and dessert Apples, mostly the production of their fruit nursery at Fulham. The best and better known varieties were those shown, and although excelled by some others from more favoured localities, the size of many was not exceeded by any.

Messrs. T. River & Son, showed seedling Plums, viz., Autumn Compote, a red variety like Victoria, but rather smaller; D'Automne de Schanal, a large red Plum, 2 inches in long diameter; Monarch, a blue coloured variety, as large as King's; and Grand Duke d'Automne, an oval blue Plum; all are of good cropping qualities.

Messrs. W. Paul & Son, Waltham Cross, showed a good collection of fruit, consisting of ninety kinds of Apples, and forty of Peas.

Messrs. G. and J. Lane, Cockmanning Nursery, St. Mary's Cray, exhibited 100 kinds of Apples, the specimens being generally of medium size, and colouring high. A few fruits of seedling Apples were shown by various persons, but there was nothing which calls for special notice.

A fine dish of Late American Peaches, either Salway or Sea Eagle, was shown by Mr. E. Gilman, gr., Ingestre Hall, Stafford; and splendid Pitmaston Duchess Peas came from Mr. J. Burdett, gr. to Mrs. L. Raynor, St. Ives Place, Maidenhead.

Mr. J. Butler of Sittingbourne had dishes of Williams' Bon Chrétien, Louise Bonne de Jersey, Doyenné Boussoch, fine of colour and size.

Messrs. Laing & Co., Forest Hill, showed Tomato Pedigree, a large variety without ribs.

Dahlia of various classes were shown by Messrs. Cheal & Sons, Crawley. Mr. C. Turner of Slough, whose eighty-four blooms of show and fancy kinds were of great merit; and this year's flowering seedlings of tuberosus Begonia were exhibited by Messrs. Laing & Co.

LUTON FRUIT, VEGETABLE AND ROOT SHOW: Sept. 29.

ONE of the most commendable little shows of fruit, vegetables, and agricultural roots we have seen for a long time was held on the above date at Luton, in the Waller Street Plain Hall, as the result of the labours of an active working committee which was called together some six weeks ago, Mr. J. Cadger officiating as secretary.

This was the first show of the kind at Luton, and although the number of entries was not extensive, the quality of the exhibits was such as to give the committee every encouragement.

Amongst the most successful exhibitors of vegetables in the open division was Mr. H. L. Sell, of Luton; the collection which carried off premier honours was a splendid show and admirably staged—Mr. J. Cadger (the secretary of the show) winning 2d prize, the most notable features in the collection being some capital

dishes of Yorkshire Hero and International Potatos, with some good Tomatos of Carter's selection.

Mr. John Wood, nurseryman, of Luton, took an extra 2d in this class, a prominent exhibit being a fine Gourd of 60 lb. weight, also a twin Pumpkin.

A dish of new fruit, the American Parsley-leaf Blackberry, attracted a good deal of attention.

Madame de Fabre (gr., Mr. Baillie), The Hoop, Luton, was awarded an extra 1st for an excellent collection of vegetables.

The same exhibit also staged, not for competition, a magnificent collection of fruit, comprising many of the best varieties of Peaches, Apples, Plums, Figs, and Grapes, but the collection lacked the interest it deserved, as the exhibits were not named.

The exhibit of fruit by Messrs. Lane & Son, of Birkhamstead, was most extensive and valuable, and in every way worthy of those famous fruit growers. It comprised six varieties of Grapes, more than fifty varieties of Apples, forty-five varieties of Plums, and half-a-dozen kinds of nuts and Filberts.

APPLES.

The Apples comprised among others, examples of the following:—The Schoolmaster, Worcester Pearmain, Lady Hamilton, Lane's Prince Albert. For specimens of the older varieties we may select the Cat-head, Golden Noble, Keswick Codlin, and Ribston Pippin.

From the list of dessert kinds may be mentioned—Eckinville Pippin, King of Pippins, Scarlet Nonpareil, Devonshire Quarrenden, Dumelow's Seedling, and Pitaston Nonpareil.

Kitchen Apples were numerous represented.

PLUMS.

These were excellent, examples of the following being noticed:—Belle de Louvain, Magnum Bonum White, Cox's Imperator, Swanfall's Belle Septembre, Golden E-peren, Grand Duke, Early Transparent Gage, Archduke, Jefferson, Diamond, Bond's Seedling, Cox's Golden Drop, Sutton's Prince Euglenier, Reine Claude de Bayay.

A capital basket of Farleigh Prolific, or Chester Dawson, of great merit, was exhibited.

GRAPES.

Splendid bunches, consisting of Muscat Hamburgh, Muscat of Alexandria, Alicante, Golden Queen, and Gros Colmar, the latter with large round berries of enormous size.

In the open classes (for four bunches of Grapes, J. Blouell Maple-Essex (gr., Mr. T. Nutting), Childwickbury, St. Albans, secured premier honours for two bunches of Black Hamburgh, and two bunches of Muscat of Alexandria.

PEACHES.

Two dishes (distinct), six each,—1st prize went to the Hon. F. Lyon (gr., Mr. T. Hogg), The Hyde, Luton; 2d, Mrs. Drake Garrard (gr., Mr. G. Tisbury), Lamer Park, Wheathamstead.

MELON.

any variety.—1st, Hon. F. Lyon; 2d, Mr. G. Worsley.

FARM PRODUCE

formed an interesting feature of the show, and was very well represented.

The attendance was not as numerous as the committee could have wished, or as the exhibition merited.

SCOTTISH HORTICULTURAL ASSOCIATION.

The monthly meeting of this Association was held this week at 5, St. Andrew Square, Edinburgh, Mr. Alexander Milne, President, in the chair. There was a good attendance of members.

Mr. James Cole, Craigleith Quarries, Edinburgh, read a paper on "The Cultivation of Orchids." He alluded, in the first place, to the increasing popularity in which the growing of Orchidaceous plants was held, owing chiefly to the greater interest which had recently been propagated on their culture. He divided Orchids into two classes, the terrestrial and the epiphytal—the first growing directly on the earth, and the second growing on trees and rocks, from which, however, they received little or no nourishment, on which account they were often called air plants.

The latter, he said, were by far the most numerous and the most interesting. Mr. Cole then proceeded to describe their cultivation. The paper was of a very practical character, and gave minute details as to the treatment and growth of these plants.

Mr. Charles Taylor, Royal Botanic Garden, Edinburgh, next read a paper on "The Propagation of Plants." He pointed out that the first thing necessary for carrying out this work were suitable houses, pits, and frames, because without these, no matter

what the skill of the operator, his labour would be at a discount. The whole system of successful propagation, he said, might be described thus—to produce circumstances and surroundings that would prevent undue evaporation, at the same time maintain circulation and plant growth, until such time as roots could be formed in the cutting, and a union between stock and scion. Interesting discussions followed both the papers, and a vote of thanks was given to each of the authors.

The exhibits on the table included Orchid blooms, sent in by Mr. Alexander Grant, St. Leonard's Hill, Dunfermline; a collection of Cactus Dablias, and twenty-eight varieties of Carnations, by Archibald Thomson, Beech Hill Gardens, Haddington; three new summer-flowering Chrysanthemums and a new white tuberous-rooted Begonia, named Miss Nisbet Hamilton, by Messrs. Thomas Methven & Sons, Edinburgh; cut flowers of Mme. Desgrange and blooms of the new golden variety in remarkably fine condition, by Wm. Rushion, Clerwood, Corstorphine, for which a Cultural Certificate was awarded; hardy flowers by Mr. Morris, Hay Lodge, Trinity; blooms of early-flowering Chrysanthemums, by Mr. McMillan, Edgehill, Dean; and a collection of Apples from maiden trees, an American variety named Washington being very fine, by Mr. John Downie, nurseryman, Beech Hill, Corstorphine. Scottish News.

CRYPTOGAMIC SOCIETY OF SCOTLAND: CONFERENCE IN ABERDEEN.

The Cryptogamic Society of Scotland opened its twelfth annual conference in Aberdeen on Wednesday, September 29, and which was continued until Friday, the 1st inst. It was proposed to hold a show of cryptogamic plants during the meeting of the Society, but the autumn has proved so unfavourable that plants are in bad condition, and the idea was therefore abandoned. The formation of this Society was first resolved upon at a meeting of botanists held in Aberdeen on September 18, 1874, and a committee of organisation was then appointed, which gave in its report at a meeting held in Perth in April, 1875, at which the Society was formally constituted. The list of members embraces some of the most eminent names in the scientific world at home and abroad, many of whom were present. On Wednesday forenoon the members of the Society visited Monymusk, with the object of searching for specimens of cryptogamic plants, but owing to the disagreeable nature of the weather the excursion was not very successful.

In the evening council and business meetings were held in Marischal College, and afterwards a public meeting was held, at which Professor J. W. H. Trail, M.D., F.L.S. (of Aberdeen University), the President for the year, occupied the chair, and delivered his annual address, the subject of which was "The Uses and Practical Application of Cryptogamic Plants." On the motion of Rev. John Stevenson, Glamis, a vote of thanks was accorded Professor Trail for his address.

Mr. A. Stephen Wilson, Aberdeen, then read a paper on "The Reproduction of Smut." The paper, which was written for the most part from practical observation, was highly interesting. Mr. Wilson contended that the parasite was introduced into the plant along with the food of the embryo through the ocellulum. A short discussion followed the reading of the paper, in the course of which Mr. Flouwright, King's Lynn, complimented Mr. Wilson on the individuality with which he had infused his paper; and on the motion of Dr. Calder, Greenock, a vote of thanks was passed to Mr. Wilson.

The President then read a paper written by Mrs. Farquharson, of Houghton, on several varieties of British Ferns, after which he gave the substance of two papers which he would have read had time permitted. They related to the additions to the lists of Scottish leaf fungi. The conference then adjourned.

The members of the Society left the Joint Station, Aberdeen, on Thursday, by the 10.10 A.M. train, for Drum. The woods in the vicinity of Park and Drum were visited, and a number of interesting specimens of fungi (including those that cause disease in Larch trees and a few edible varieties) were obtained. Although the day was spent very pleasantly, the excursion was not, on the whole, very productive, owing to the fine dry weather which has prevailed there for some time. The members returned to the city in the evening, when they sat down to an excellent dinner in the Douglas Hotel, under the presidency of Professor Trail.

On the last day of the conference, Friday, the 1st inst., the members visited Kincaise grounds, where a most enjoyable day was spent, and much valuable information obtained. A meeting in Marischal College in the evening terminated one of the most successful conferences yet held under the auspices of the Society. W. K.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, OCTOBER 6, 1886.

Table with columns: MONTH AND DAY, BAROMETER (Mean, Daily, etc.), TEMPERATURE OF THE AIR (In, In shade, etc.), Hygrometrical indications (Wet bulb, etc.), WIND (Direction, Force), RAINFALL.

Sept. 30.—Dull and cloudy in m. throught, fine and bright afternoon. Oct. 1.—Fine and warm day, throughout. Oct. 2.—Fine day, sky nearly cloudless. Oct. 3.—Fine and bright day throughout, fine night. Oct. 4.—Fine day, and unusually warm; very close. Oct. 5.—Fine day; the temperature rose 3° high for Oct. r. Oct. 6.—Rain in the morning, great darkness at 9 A.M.; fine and bright afternoon.

LONDON: Atmospheric Pressure.—During the week ending October 2nd, the reading of the barometer at the level of the sea increased from 30.10 inches at the beginning of the week, to 30.11 inches by the afternoon of the 26th September, decreased to 29.89 inches by 5 P.M. on the 27th, increased to 30.19 inches by 9 A.M. on the 28th, decreased to 29.50 inches by the afternoon of October 1, and was 29.90 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.98 inches, being the same as last week, and 0.08 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 75°.5 on the 1st; the highest on the 26th was 61°.5. The mean of the seven high day temperatures was 66°.

The lowest temperature in the week was 47° on October 2d; the lowest on the 30th, was 50°. The mean of the seven low night temperatures was 50°.4.

The greatest range of temperature in one day was 25° on the 1st of October; the smallest was 7°.9 on the 30th of September. The mean of the seven daily ranges was 15°.6.

The mean daily temperatures were, 54°.4 on the 26th, 55°.5 on the 27th, 55° on the 28th, 60°.9 on the 29th, 59°.2 on the 30th, 62°.5 on Oct. 1st, and 55°.2 on the 2d. These were all above their averages, with the exception of the 26th, which was 0°.3 below, by 0°.9, 0°.5, 0°.5, 4°.9, 8°.1, and 1° respectively.

The mean temperature of the week was 57°.5, being 4°.1 higher than last week, and 3°.1 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the fall rays of the sun was 122° on the 1st. The mean of the seven high readings was 99°.

Rain.—Rain fell on two days to the amount of 0°.38-inch.

ENGLAND: Temperature.—During the week ending October 2nd, the highest temperatures were 79° at Cambridge, 75°.5 at Blackheath, and 70° at Nottingham, Sheffield and Leeds; the highest at Sunderland was 64°, at Plymouth 65°, and at Liverpool and Newcastle 66°. The general mean was 68°.1.

The lowest temperatures were at Wolverhampton 39°.9, at Cambridge 41°.5, and at Truro 42°; the lowest at Brighton was 50°.5, at Plymouth 49°, and at Leeds and Preston 48°. The general mean was 46°.2.

The greatest ranges were at Cambridge 37°.5, at Blackheath 28°.5, and at Wolverhampton 27°.7;

A. B. C. BULB GUIDE.

Prepared with very much care, containing most reliable information upon Bulbs generally, including the following families:—

- HYACINTHS, TULIPS, CROCUS SNOWDROPS, CHIONODOXAS, GLADIOLUS, &c.
Very extensive lists of varieties of these are included, consisting of nearly every variety which can be considered worth growing.

IRIS—Of these I hold one of the finest collections in the world: six pages are devoted to this family alone.
HELLEBORES, or CHRISTMAS ROSES, are a great speciality at Tottenham. The collection is very complete, and the plants are exceptionally good.

DAFFODILS and LILIES

constitute Part II. of my Bulb Catalogue, Twenty-six pages being devoted to them. Both families are cultivated by me most extensively, my collection including almost every variety in cultivation.

THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM. LONDON.

CROUX & FILS, Nurserymen, Vallée d'Aulnay, Chatenay (Seine). Great Speciality. Trained Fruit Trees, very strong, will fruit early.
1867—Prize of Honour for Artistic Efforts.
1878—Two Large Prizes, Cross of the Legion of Honour.

CHEAP OFFERS IN CHOICE PLANTS For House and Garden. 100 STOVE or GREENHOUSE PLANTS.
Other offers and in smaller quantities, see CATALOGUE, which will be forwarded on application.

E. G. HENDERSON & SON, Pine-apple Nursery, Maida Vale, LONDON. W.

NEW DESSERT APPLE, "Beauty of Bath,"

GEO. COOLING & SONS

Have pleasure in offering a small Stock of this fine early Dessert Apple.
It ripens in July and early part of August, is quite distinct, of medium size, exceedingly handsome in appearance, being beautifully striped with red towards the sun, has a brusk, sweet flavour, and is in every respect far superior to Jonathan or Irish Peach: it is a large and certain cropper, and on that account will be most valuable as a market variety.

Strong Maiden Trees, 3s. 6d. each; Pyramids, 5s.

THE NURSERIES, BATH.

GOOD and CHEAP.—40,000 GOOSEBERRIES, including Whinham's Industry, 15s. 00 APPELES, PEARS, and PLUMS, strong and healthy, in various forms. 10,000 LAURELS, Caucasian, Common, and Rouzédulium, 2 to 4 feet, extra fine. 30,000 Oval and Evergreen PRIVEE, strong and bushy 2 to 4 feet. Also large stocks of Tree BOX ACACIAS, THUAS, POPLARS, LABURNUMS, LINES, SAKAL, &c. Special low quotations on application.
HARRISON AND SONS, Seed Growers, Leicester.

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.—Too well known to require description. Price 6s. per bushel (1s. extra per bushel for packages), or 6d. per cake; free by parcel post, 1s.
None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached.
WM. CUTBUSH AND SON (Limited), Nurserymen and Seed Merchants, Highgate Nurseries, N.

SEEDLING PLANTS OF CHOICE FLORISTS' FLOWERS,

Table with columns: Name, Per doz., Per 100. Lists various flower varieties like Calceolarias, Cinerarias, Canticberry bells, etc.

JARMAN'S BULBS

JARMAN'S SEEDS

LARGE DESCRIPTIVE CATALOGUE of Bulbs, Seeds, Roses, Plants, Ferns, &c. A Complete Guide for Amateurs. Gratis and Post-free.

GARDEN REQUISITES.

- COCOA-NUT FIBRE REFUSE, 4d. per bushel; 10s. for 2s.; truck (loose, about 2 tons), 40s.; 4-bushel bags, 4d. each.

The Coloured Figures by JOHN NUGENT FITCH, F.L.S. Dedicated by special permission to Her Royal Highness the Princess of Wales.

Five Volumes, containing 240 Hand-Coloured Plates, now ready, Price £15, unbound, or bound in strong hand-some covers with gilt edges, Price £16 10s.

This Album is issued in Royal Quarto, which enables the Artist to produce ample and intelligible portraits of the plants, which are drawn and coloured by hand in the best style.

The Text comprises English botanical descriptions of the plants figured, notes on their cultivation, and such general observations concerning them as may be likely to prove of interest or utility to Orchid-growers.

The Work is issued regularly in Monthly Parts. Each Part contains four hand-coloured and gilded Plates, with descriptive Letterpress; and a Volume, consisting of Twelve Parts, is completed annually.

Prices, per Part, or 60s. per annum (Twelve Parts), Post free. Vols. I., II., III., IV., V., and VI. can be supplied, bound complete, with gilt edges, price £15, each.

JUST PUBLISHED,

THE ORCHID-GROWERS' MANUAL,

Sixth Edition, Enlarged and Revised

BY BENJAMIN SAMUEL WILLIAMS, F.L.S., F.R.H.S. Author of the "Orchid Album," "Selected Ferns and Lycopods," "Choice Stove and Greenhouse Flowering Plants," "Choice Stove and Greenhouse Ornamental-leaved Plants," &c.

Post 8vo., Cloth, Price 15s.; Price by Parcel Post, 15s. 6d.

Profusely Illustrated with a large number of plate and double-page Engravings on Wood, together with Blocks illustrative of types of the various genera.

This popular work has been entirely remodelled and revised up to the present time, and has been enlarged to 659 pages. It contains descriptions of upwards of 1200 species and varieties of Orchidaceous plants, together with 475 synonyms; also authorities for the names, the families to which the various genera belong, the flowering period, native country, and references to figures.

Published by B. S. WILLIAMS, at the VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

May also be had of all Booksellers and the following Agents:— Agent for the Continent— Mr. NILSSON, 12, Rue Aubur, Paris. Agent for U.S. America— Mr. CHAS. MAROT, 814, Chestnut Street, Philadelphia. Agent for India— Mr. S. P. CHATTERJEE, 73, Narcoodangah Main Road, Calcutta. Agent for South America— Mr. P. M. BINOT, Nurseryman, Petropolis, Brazil.

22 Pages, Illustrated, Post-free. See Pages 6 to 13 for

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

Oil Paint no Longer Necessary. This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unscrupulous imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. From ALFREDO LOWE, Esq., The Ryegate, Alderley Lodge. "Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so cheaply advertised. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH, Brierly Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 126, Stephen's Green, Dublin.

Rosher's Garden Edging Tiles. THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are especially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "gravel" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of designs. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price Lists Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3d. per square yard upwards. Pattern Sheet of Plain or more elaborate Design, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Raages, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c.

F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf to London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. WANTED, a WAREHOUSE PORTER. Wages 15s. Must be experienced.—HY. CLARKE and SONS, 39, King Street, Covent Garden, W.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 43, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

LETTERS addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

ADVERTISERS are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement to which they wish Repeated.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be glad to supply any Lady or Gentleman with particulars, &c.—St. John's Nursery, Worcester.

GARDENER (SINGLE-HANDED or SECOND).—Age 25, married, no family; good experience in Indoor and Outdoor Work. Two and a half years in last place. Good recommendation.—C. P., Grove Lodge, Church Street, Epsom, Surrey.

GARDENER (SINGLE-HANDED or UNDER).—No family; wife excellent landress. Good character.—T. MARSHALL, Rectory Road, Chelmsford.

GARDENER (SECOND), in a large place, or SINGLE-HANDED.—Age 34, married, three in family; four years' good character from present employer.—W. TUSLAND, Seedsmen and Florist, 23, Gold Street, Stratford.

GARDENER (UNDER); age 18.—J. HORSER, The Gardens, Myton Hall, Helperry, York, wishes to recommend a young man; two and a half years' experience.

GARDENER (UNDER).—Age 20; six years' experience both indoors and out. Good references.—C. H. MORTER, Coltsall, Hall Gardens, near Norwich, Norfolk.

GARDENER (UNDER).—A young man, who has lost his place owing to reduction of establishment. More good character. Apply for reference to E. E. W. CRACKFOT, Esq., Hachthorn Hall, Lincoln.

GARDENER (UNDER).—Age 18.—Mr. DRIVER, Gardener, Longford, Min-ninhamp, Gloucestershire, can strongly recommend a young man. Four years in present situation.

GARDENER (UNDER), or COWMAN.—Married, no family. No objection to make himself useful. Good character.—A. B., 15, Railway View, Slough, Bucks.

FOREMAN, or SECOND GARDENER, inside.—Age 25; eleven years' experience.—JAMES BACKHOUSE AND SONS, The Nurseries, Wok.

FOREMAN, in a good establishment.—Age 23; can be well recommended.—H. W., Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

FOREMAN, in the Houses.—Age 26; understands the Culture of Vines, Peaches, Melons, and Stove and Greenhouse Plants. Two years' good character.—C. FIKIN, Woodside Cottage, Egham, Godalming, Surrey.

FOREMAN; age 25.—**MR. W. BASKET**, Gardener to W. Palmer, Esq., Hildoe, Reading, will be pleased to recommend his late Foreman to any Gentleman's Gardener requiring a competent man.

FOREMAN, or otherwise, in a private establishment.—Age 26; thorough general knowledge of Gardening. Highly recommended.—FOREMAN, Spring Hill House, Malvern Wells.

FOREMAN; age 26.—**MR. BRICH**, Head Gardener at the Victoria Hotel, Windward Hill, Harry Hill, Durham, can with confidence recommend a man as above.—T. HARRISON, Stone House, The Godstons, Wolverhampton.

To Head Gardeners.
FOREMAN, &c.—A fair Bonus given for a situation as above. Competent especially in Propagating and Forcing. Highest references.—W. T., 186, High Street, Southampton.

FOREMAN, or SE-COND.—Age 25; eleven years' experience in good establishments. Good character from last and previous employers.—P. MARTIN, Walker, Leamouth, Leamouth, Leamouth.

PROPAGATOR AND GROWER.—Well up in the most recent methods of propagating Cut Flowers, and General Nursery Trade. Good reference.—G. H., Sea View, Sudebn Road, Worthing, Sussex.

PROPAGATOR (ASSISTANT).—Three and a half years in present situation.—E. P., Colon Hill Nursery, Shrewsbury.

ROSE GROWER.—Well up in Propagating, Indoors and Out. Thirteen years' experience.—JAMES LOVELESS, Royal Nurseries, Grimsby.

JOURNEYMAN (FIRST), in a large establishment.—Age 24; one year's experience in good places, two years' present, three years' previously at Hawkesley Park.—G. L., Heathfield, Addington, Croydon.

JOURNEYMAN (FIRST), in a good establishment.—Age 23.—Mr. FORD, Gardener to H.R.H. the Duke of Edinburgh, Eastwell Park, Ashford, wishes to recommend a young man as above.—J. EASTWELL, Eastwell Park, Ashford, Kent.

JOURNEYMAN, in the Houses.—Age 22; acquainted with Orchids.—E. EVE, 3, Whitechurch Lane, Edgware, Middlesex.

JOURNEYMAN, in a good establishment.—Age 21; three and a half years in present situation. Well recommended by present employer.—J. GREEN, Eastwell Gardens, Ashford, Kent.

JOURNEYMAN; age 21.—**A. GATES**, Gardener to Dr. Meadows, J.P., wishes to strongly recommend a young man as Journeyman in a good Gardening establishment.—Poyle Manor, Colnbrook, Slough.

JOURNEYMAN, in the Houses, in a good establishment.—Age 21; seven years' experience; two years' character.—Booth preferred.—G. WRIGHT, The Gardens, Morkhams, Woodford, Essex.

JOURNEYMAN, in a good establishment.—Age 21; eighteen months in present situation. Well recommended by present and previous employers.—W. SILK, Eastwell Gardens, Ashford, Kent.

JOURNEYMAN, Inside or Out.—Age 19; five years' experience. Twenty-one month's good character from present situation.—F. WICKHAM, Highlands, Keymer, Sussex.

JOURNEYMAN, Inside and Out; age 21.—T. HUTCHINS, Gardener to E. Charrington, Esq., Bury's Court, Reigate, strongly recommends a man as above.—The Gardens, Bury's Court, Reigate.

JOURNEYMAN, in the Houses, or Inside and Out.—Age 26; seven years' experience. Good character.—F. SMITH, The Gardens, Oakley House, Gledhow, Leeds.

JOURNEYMAN, or SECOND, in a good establishment.—Age 21; six years' experience.—B. T. WOOD, Hidon Castle, Burton-on-Trent.

IMPROVER, in or out of Houses; age 19.—Mr. W. FRASER, The Nursery, Malme-bury, can recommend a strong youth.

TO NURSERYMEN.—Wanted, a situation under first class. Eight years' experience. Good references.—Age 23.—A. M., Mr. Phillips, Jepson Road, Upton, Feres Gate, Essex, E.

TO NURSERYMEN.—Wanted a situation in a Nursery, to ASSIST in the Growing of Soft-wooded and other Plants.—GREGORY AND EVANS, Longlands Nursery, Salford.

TO NURSERYMEN.—An active young man desires an engagement in a Nursery. A small salary would be accepted, where further knowledge of trade might be acquired.—IMPROVER, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

TO HEAD GARDENERS.—Wanted, a situation for a respectable youth (age 18) in a good establishment. Small premium given if required.—W. FENNEL, 2, Albion Cottages, Shooters Hill, Kent.

TRAVELLER, in Nursery or Seed Business. Twenty years' experience in the Trade.—M. D., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN.—Thirteen years' experience in all branches; understands Book keeping. Total abstaner. First-class reference.—C. E., Gardeners' Chronicle Office, 41, Wellington Street, W.C.

SHOPMAN, or ASSISTANT, in Retail or Wholesale Seed, Warehouse.—Four years' experience, with a knowledge of Nursery and Office Work. Good testimonials.—R. MILL, 16, Reform Street, Dundee, N.E.

SHOPMAN.—Several years' experience. Knows the business thoroughly in all its departments.—Seeds, Bulbs, Tools, Sundries. Fair knowledge of Nursery Stock.—HORTUS, 16, Blagrove Place, Glasgow.

To the Seed Trade.
SHOPMAN.—Ten years' experience in first-class class houses, including James Dickson & Sons, of Chester. Unexceptionable references.—SUNBEAM, 80a, George Street, Edinburgh.

Seed Trade
SHOPMAN, or ASSISTANT.—Age 26; with thorough knowledge of Seed Trade and hatches; can be well recommended.—W. B., Lamoureux & Co., Plymouth.

CARPENTER, PAINTER, or HANDY MAN, on a Gentleman's Estate or otherwise.—Fourteen years' character from last three places. Total abstaner.—J. T. L., 51, Whistler Street, Drayton Park, London, N.

HOLLOWAY'S PILLS.—The Stomach and its troubles cause more discomfort and bring more unhappiness than is commonly supposed. The thousand ills that settle there may be prevented or dissipated by the judicious use of these purifying Pills, which act as a sure genuine anti-acid agent, with at the same time the nerves of the most susceptible or irritable, the most delicate organization. Holloway's Pills will bestow comfort and cover relief on every headachy, dyspeptic, and sickly sufferer, whose tortures make him a burden to himself and a burthen to his friends. The Pills have long been the popular remedy for a weak stomach, for a disordered liver, or a paralysed digestion, which yield without difficulty to their regulating, purifying, and tonic qualities.

NEW FERN, "ADIANTUM CUNEATUM ELEGANS."

CHARLES KERSHAW now offers this beautiful FERN, which will probably supersede all others for cutting and decorating. Hitherto almost the only Fern used for these purposes has been the "cuneatum." This new form of it is *hardier*, stands better when cut, and will produce more than twice the number of fronds than that old favourite. Nothing more need be said of its merits than to give the following condensed description of it from the *Gardeners' Chronicle* for August 1, 1885, by the highest authority on Ferns, Mr. MOORE:—

He says:—"This is an elegant variety of the old favourite *Adiantum cuneatum*. The fronds are of about the same size, and the light airy appearance which its small and wide-set pinnules give to it, gives it a perfect claim to the title of elegans which we propose to apply to it. Less dense than the typical form, and less gossamer-like than the variety *gracillimum*, it is about intermediate between the two, perfectly distinct and equally effective as a decorative plant."

The Editor of the *Gardeners' Chronicle*, October 2, 1886, says:—"This variety retains the elegant character which suggested its name—it is pleasing and graceful in appearance. The plants before us are of a dense stocky habit, and carry an enormous number of fronds, and are well fitted for furnishing and decorative purposes."

Extra Strong Plants, a foot across, with from 30 to 50 fronds, each 2s. 6d., or free per Parcel Post 3s.

PRICE TO THE TRADE ON APPLICATION.

THE DARLINGTON

GOLD MEDAL ALL-WOOL DRESS FABRICS

(AS WORN BY H.R.H. THE PRINCESS OF WALES)

Are now Supplied Direct from the Manufactory, at Wholesale Price, there being no Intermediate Profits whatever.

PLEASE NOTE THAT ANY ARTICLE CAN BE CHANGED WITHIN SEVEN DAYS.

Ladies in any part of the World are invited to Send FOR PATTERNS, Post-free, of the new makes for the Autumn and Winter Seasons, which embrace every variety of material desired, and of which the *Daily News* says:—

The union of warmth to lightness, so necessary to health, is, in these materials, brought to perfection. . . . The fineness of the wool of which they are composed—English wool, be it understood—imparts the admirable quality of draping in those soft folds now so essential from the point of view of fashion.

SPECIAL ATTENTION is directed to our celebrated CROSS-WARP SERGES, which, alike, resist the effects of weather and sea, 10½d. to 3s. per yard. Our GOLD MEDAL CASHIMERES, in all the New Colourings, from 1s. 6d. to 4s. 6d. per yard. NEW and FASHIONABLE COSTUME CLOTHS in great variety, from 6½d. to 5s. per yard, including "The LOWSTOCK," "The ASHEHURST," "The DAMIETTA," "The KHAIKIBER," "The SHU'MLA," "The TARAPACA," "The PANAMA," "The HOLTSTEIN," "The ZEELAND," &c.

CHARMING NOVELTIES in SKIRTINGS, including "The YESSO," "The NINGPO," "The FOO-CHOO," &c.

PATTERNS POST-FREE.

DWARF STANDARDS, from 10s. per dozen,
DWARFS, from 6s. per dozen,
CLIMBING, from 6s. per dozen,
FORCING, in Pots, from 2s. per dozen,
NEW VARIETIES, from 18s. per The Rose Garden, by WM. PAUL, F.L.S., 5th edition, with plates, 2s.; the same without plates, 10s. 6d. The Rose Annual, with plates, six parts, 4s. each. Roses in Pots, 5th edition, 2s. Roses and Rose Culture, 1s.

PAUL'S — Camellias — WALTHAM CROSS.

The Largest and Finest Stock in Europe.
GOOD PLANTS, from 2s. per dozen,
SPECIMENS, from 1 to 30 guineas each,
AZALEAS, Winter-blooming, HEATHS, FICARISES, GARDENIAS, STEPHANOTIS, LA-PAGERIE and other STOVE and GREENHOUSE PLANTS.
HERBACEOUS PLANTS—a choice collection.

PAUL'S — Trees — WALTHAM CROSS.

PLANES, LIMES, and other FOREIGN and PARK TREES, from 12s. doz.
WEEPING TREES " 15s. "
FLOWERING " 25s. 100.
EVER-GREEN " 25s. "
PICTORIAL TREES " 4s. "
RHODODENDRONS,
Seedlings " 25s. "
Named sorts " 10s. doz.
CLIMBING PLANTS, 3s.
Planting done by Estimates or Contract.

PAUL'S — Seeds — WALTHAM CROSS.

Of every description, of the first quality, and low in price.
VEGETABLE SEEDS for autumn sowing—PEAS, BEANS, CABBAGE, CAULI FLOWER, CARROTS, CRUCIFERACEOUS, LETTUCE, MIGNARD, ONION, RADISH, SPINACH, TURNIP, &c.
FLOWER SEEDS, various, for autumn sowing—GERANIUM, CALCEOLARIA, PRIMULA, CYCLAMEN, BALSAM, ANEMONE, &c. The best florists' strains are always on sale.
MUSHROOM SPAWN, 5s. per bush.
MATS, TRENCHELS, GLOVES, TOOLS and every garden requisite, GLADIOLI, BRENCHELVENSIS, fine, 5s. per 100, 15s. per doz.

PAUL'S — Fruit Trees — WALTHAM CROSS.

APPLES, PEARS, CHERRIES, PLUMS, Standards, from 15s. doz.
" Pyramids " 12s. "
" Dwarf-trained " 7s. "
Standard-trained, 6s. 6d. each
APRICOTS, PEACHES, and NECTARINES, Dwarf-trained, from 20s. per doz.
Standard-trained, 2s. 6d. each
GRAPE VINES, 2s. 6d. to 10s. 6d.
FICUS, 2s. 6d. to 12s. 6d. each, each
RASPBERRIES, from 12s. 6d. per 100.
STRAWBERRIES, fr. m 3s. per FILBERTS, from 6s. per dozen,
CURRANTS of a DOZEN-BERRIES, from 3s. per doz.

Goods packed for all parts of the world. Full Descriptive and Priced CATALOGUES will be forwarded, post-free, on application. Special and Reduced Price where large quantities are required. Inspection invited.

WALTHAM CROSS, N.

ANTHONY WATERER

Invites attention to the following List of well-grown and properly rooted NURSERY STOCK:—

ABIES CANADENSIS, 4 to 8 feet.
DOUGLASSI, 10 to 6 feet.
DOUGLASSI GLAUCA, 3 to 5 feet.
HOOKERIANA or PATTONIANA, 3 to 5 feet.
ORIENTALIS, 4, 5, 6 to 10 feet, hundreds.
PARRYANA GLAUCA, 1 1/2 to 3 feet, hundreds.
CEDRUS ATLANTICA GLAUCA, 3 to 6 feet.
DEodar, 6 to 10 feet.
LIBANI (Cedar of Lebanon), 4 to 5 feet, hundreds.
CUPRESSUS LAWSONIANA ERRECTA VIRIDIS, 3, 4, 5 to 8 feet.
JUNIPER Chinese, 6, 8, 10 feet.
Chinese, Golden, 3 to 8 feet.
PICEA CONCOLOR, 2 to 5 feet.
GRANDIS, 4 to 7 feet.
LAIQCARPA, 3 to 5 feet.
MAGNIFICA, 2 to 3 feet, hundreds.
NORDMANIANA, 4, 5, 6, 7, to 10 feet, hundreds.
PINSAPO, 6 to 10 feet.
PINUS AUSTRIACA, 3 to 7 1/2 and 4 feet, well furnished and transplanted October, 1885, thousands.
CEMERA, 3, 6 to 8 feet.
RETINOSPORA OBTUSA AUREA, 3 to 6 feet.
PISIFRATRA (true), 3 to 6 feet.
PLUMOSA AUREA, 3 to 5 feet.
THUIOPSIS BOREALIS, 3 to 6 feet.
DOLABRATA, 3, 4, and 6 feet.
THUILLOBRII, 4 to 6 feet.
OCCIDENTALIS LUTEA, 3 to 6 feet.
SEMPER AUREA, 2 1/2 to 3 feet.
YEW, Common, 3, 4, 5 feet, thousands.
Common, 6 to 10 feet.
Gallen, of all sizes up to 10 feet.
WAVY thousands as Pyramids, Globes, and Standards, in point of variety and size unequalled.
Golden, Seedlings, 3, 4, 5, to 8 feet.
Irish, 3 to 10 feet, hundreds.
Irish Golden, seedlings, 3, 4 and 5 feet.
AZALEAS, Hardy, the finest varieties known, 3, 3, 4, and 5 feet, thousands.
RHODODENDRONS, 2, 4, 5, 6, 8 to 10 feet, thousands of finer plants than can be found in any other Nursery.
The Five Standard and other Rhododendrons annually planted at the Queen's Row, Hyde Park, are supplied by ANTHONY WATERER.
ACUCUA JAPONICA, 2 1/2 to 4 feet.
BAMBOO METS, 5, 6, 8, 10, 12, 15, 18 feet high, transplanted spring, 1885, hundreds.
Green and Variegated, 3, 4, 5, 6 to 7 feet, thousands.
HOLLIES, Common Green, 3, 4, 5 up to 10 feet.
ALLACI ACENSE,
" HODGINS',
" LAURIPOLIA, 3, 4, 5 up to 10 feet.
" MYRTILLIFOLIA,
" SCOTICA,
Yellow berried and other sorts,
Variegated, 3, 4, 5, 6 to 7 feet,
Golden Queen, 3, 4, 5, 6, 7 to 10 feet, hundreds of beautiful specimens.
Silver Queen, 4 to 10 feet, sale did specimens.
Weeping, 10 feet, straight stems, with heads of ten to fifteen years' growth.
Weep 2, New Golden, a large quantity of beautiful plants.

The following trees have stout, straight stems, fine heads, & splendid roots, and have all been transplanted within two years:—
ACACIA, BACCHARIA, 6 to 12 feet.
SEMPER FLORENS, 12 to 14 feet.
ACER DASYCARPUM, 12 to 16 feet.
" WIERI LACINIOSA, 10 to 12 feet.
NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
LEOPOLDII, 12 to 14 feet.
REITERI BIRCH, 12 to 10 feet.
SCYDOPHYLLA, 12 to 14 feet.
WORLEVI, Standards, 12 to 14 feet.
ASH, Mountain, 10 to 14 feet.
BEECH, Common, 10 to 12 feet.
Purple, Pyramids and Standards, 9 to 16 feet.
BIRCH, Purple, 14 to 15 feet.
Silver, 14 to 16 feet.
CHESTNUT, HORN, 14 to 16 feet.
" Double White, 10 to 12 feet.
" Scarlet, 12 to 16 feet.
" Spanish, 12 feet.
ELM, English, 10 to 12 feet.
Guernsey, 12 feet.
LIMES, 10 to 16 feet.
" EUCYLORA or DASY-TILA, 10 feet.
" SIVER-LIME, 10 to 14 feet.
LIQUIDAMBAR, 12 to 14 feet.
MAPLE, Norway, 14 to 16 feet.
OAK, English, 10 to 12 feet.
" Scotch American, 12 to 14 feet.
PLANES, English grown, 12 to 16 feet.
POPLAR HOLLEANA, 10 to 12 feet.
" BARKERI, 12 to 14 feet.
" SILVENSIS (true variety), 12 to 16 ft.
SYCAMORE, Common, 14 to 16 feet.
Purple, 14 to 16 feet.
THORNS, Double Scarlet, 8 to 10 feet.
" Single White, 8 to 10 feet.
WALNUTS, Common, 10 to 12 feet.

WEeping TREES.
BEECH, Weeping, Pyramids and Standards, 8 to 12 feet.
" Purple, Pyramids and Standards, 8 to 12 feet.
BIRCH, Young's Weeping Pyramids and Standards, 8 to 14 ft.
ELMS, Weeping, Pyramids and Standards, 7 to 14 feet.
LARCH, Weeping Pyramids, 6 to 10 feet.
" Weeping English, Standards, 10 to 12 feet.
POPLAR, Weeping, Pyramids and Standards, 10 to 12 feet.
SOPHORA JAPONICA PENDULA, Standards, 8 to 9 feet.

W. H. Young, Barton F. de Rothschild's, and Ethelred, Miss Alice de Rothschild's—together the most extensive and successfully planted places in the history of England—were supplied principally by the Knap Hill Nursery.
Intending planters are invited to inspect the Plants growing; no one interested in such matters will regret the trouble. Catalogues convey but a very inadequate idea of such a stock.

A DESCRIPTIVE CATALOGUE will be sent on application.

Knap Hill Nursery, Woking, Surrey.

THE Gardeners' Chronicle.

SATURDAY, OCTOBER 16, 1886.

MILFORD.

IF it became necessary to show the "intelligent foreigner" a good specimen of a small country town, and an equally good specimen of a country village, it would be difficult to find better samples of either within the same distance of London than are afforded by the town of Godalming and the village of Milford respectively. After passing the gravels and clays of the Thames Valley, the heaths and sands of Woking, and—astonishing transformation!—the chalk at Guildford, the traveller is landed in a greensand district, with a sandy and loam soil, richly wooded, with little streams and meadows in the hollows, and on the high ground hills which stretch away towards Reigate and on past Maidstone, till they abut on the sea coast at Folkestone. Neither the town nor the village has any very special feature, but both are pictorial and charming. Tapering spires, grey towers, timbered houses and gabled roofs peep out from a dense mass of foliage—so dense that the size of the huge trunks is concealed, and no adequate idea of their size is obtained till you come close up to them. The neighbourhood has some interest for the botanist too, for yonder red-brick manor house, set round with noble trees, was the property of Philip Barker Webb, he who wrote the Flora of the Canaries, was the friend and collaborator of Sir William Hooker, and who left his valuable library and herbarium to the Grand Duke of Tuscany, both being now preserved at Florence. Amid such surroundings is situate the nursery of Mr. Maurice Young—a nursery principally devoted to hardy trees and shrubs of all descriptions—and, in so far, not very different from hosts of similar establishments up and down the country. But the visitor interested in such things will hardly have set foot in the grounds before the impression will be forced upon him, that this is no ordinary collection of trees and shrubs, but that taste and intelligence have been markedly called into play in getting together so interesting a collection of choice things. There is an individuality about these matters which shows itself in contrast to the mechanical uniformity one sees in cases where there is little or no feeling experienced for the plants beyond that attaching to their money value. The truth is that these nurseries are not merely stores, but answer the same purpose that sketches do to an artist. An artist must have his colours and his brushes no doubt, but he will set even greater store upon the sketches by whose aid he will develop his picture. So in the case before us, it is easy to see that the trees and shrubs have been selected with a view to landscape effect—this for its form and habit, that for its size, that for its colour, whether of flower or foliage, and so on. These are the materials which Mr. Young, in his quality of landscape

gardener, so well knows how to utilise. They form the foreground of the nursery, while away in the background are the serried ranks of forest trees for those whose requirements are more utilitarian. What a pleasant thing it is to fall in with the proprietor of such an establishment, and when he acts as *chierone*, unfolding as he goes along a mass of interesting detail, the result of long years of observation, there is for the plant-lover no greater pleasure; at every turn some fresh object of interest is unfolded, at every moment some old fact put in a new light. When some time has been spent in this pleasant occupation, and the attempt is made to recall the scene and the conversation, a difficulty is experienced in knowing where to begin, and as recollections pour in there is an equal difficulty in knowing how to arrange and methodise the detail. The problem how and when to end, which would otherwise be difficult, finds its solution here in the exigencies of time and space.

If we had to pick out the most brilliant feature of these nurseries we need not long hesitate. Young's Golden Juniper, a sport from the Chinese Juniper, must undoubtedly take precedence as one of the very finest, if not the finest golden Conifer. Here the coloration is magnificent, superior even to that of the best golden Lawson's Cypress. The clear golden-yellow pervades the whole plant, and is apparent on the spreading, as well as on the appressed leaves. The shrub assumes a conical or flame-shaped form, and the lines of these golden sprigs suggest the gilded magnificence of a Burmese or Siamese temple. By the roadside is the parent tree whence all this magnificence has sprung. The tree is of considerable age, the lower part green, the top refulgent gold. Cuttings from this are grafted on to the red Cedar (which, by the way, is no Cedar, but a true Juniper, else it would not graft so freely), and thus a supply is perpetuated. Another handsome plant of its class is Fisher's upright golden Yew, while among the silver tinted forms are such beautiful forms as the cerulea variety of the Fraser's form of the Lawson Cypress, the lovely Juniperus Shepherdi, the glaucous form of Abies nobilis, the blue Spruce, *Picea pungens glauca* (the *Parr yana glauca* of gardens), and many others. These variegated forms are, in some cases, less robust than the green ones, but by no means always so. Where the golden or silvery hue depends upon the absence of leaf-green (chlorophyll), there, of course, the plant may be expected to be relatively weak, and this is shown by the fact that cuttings strike with difficulty, and grafting is preferred where these plants are to be perpetuated. But when the silvery hue is due not to the absence of chlorophyll but to the presence of a layer of "bloom" on the surface, the vigour seems to be rather greater than otherwise. And this leads us to note that a remark made by one of our correspondents to the effect that yellow-berried Hollies do not come true from seed, is by no means borne out in this establishment, nor, indeed, is there any reason why they should not, as the yellow colour in this case can hardly be considered as any sign of weakness, or at least of any such degree of debility that would affect growth.

Adverting to other matters we come now upon a specimen of *Pinus Bolanderi* in cone. The plant is noteworthy for the delicacy of its deep green foliage, which renders it one of the most compact and desirable of the smaller Pines. Professor Sargent refers this to *Pinus contorta*, and an inspection of the cones serves to confirm this view, although the leaves are shorter and narrower and more delicate than in that species. In Veitch's *Manual* P. Bolanderi is considered as a form of P. muricata, but face to face with the cone-bearing plant at Milford it is impossible to come to any other conclusion than that its affinities are with P. contorta rather than with P. muricata.

Larix leptolepis, the Japanese Larch, should be planted for the elegance of its habit, the rapidity of its growth, and the pretty purple coloured tint of the young shoots, which contrasts with the glaucous green of the leaves. A form of Taxodium distichum, with slender pendulous branches, as it were, leaping from culver to curve like a cataract arrested in its course, is very striking.

Prumnopitys elegans is a very desirable shrub, with slender erect branches and narrow leaves, deep green

above, silvery beneath. It is suggestive of the Yew, but its habit is lighter and less funereal.

Athrotaxis constitutes a genus of Tasmanian Conifers of low stature and very distinct habit. The leaves are something like those of *Thuopsis dolabrata*, but not flattened, and moreover they are arranged in spires. *A. laxifolia* (grown as *A. Doniana*) is found in cone, and is clearly of the same species (*laxifolia*) as that figured in these columns some time since from Menability.

Retinosporas of all kinds and descriptions are to be found here—two deserve special mention; in the one case a plant of *Retinospora plumosa aurea* had gone back to *R. pisifera*. Retinospora has no claims to form a genus, for the forms are all stages of growth of *Thuia*s or *Juniper*s, and those which have some fixity of character about them, such as *pisifera* and *obtusata*, are rather *Cypresses* than members of a distinct genus, but on this point we cannot expect people to agree.

Tsuga Sieboldi, the Japanese Hemlock Spruce, is so handsome that we wonder it is not more often planted. It is of bushy habit, and the dark shining green foliage is bolder in character than that of the common Hemlock. Other Japanese Conifers here seem in good form, are the sturdy *Picea plicata*; *Picea ajacensis*, in which the silvery under-surface of the leaves is so very beautiful, and forms so brilliant a contrast to the purple catkins in spring. It is frequently called P. *Alcockiana*, and, indeed, is one of two things accidentally sent out under the same name. The true *Alcockiana*, or that to which the name is now restricted, does not seem to do well in this country; wherever we have seen it it has had a scraggy aspect, and shows a precocious tendency to form cones—a sign that is not a welcome one to the tree-lover, as it generally indicates debility.

YOUNG'S CYPRESS.

Closely allied to the Lawson Cypress, and perhaps a seedling variety of that very protean species, is a form which amply deserves recognition as Young's Cypress. The general form is that of Lawsoniana, but the habit is more robust, the leaves are considerably larger and of a very rich deep emerald green colour. The old wood is reddish-brown; the lateral branches or shoots are elongate ascending, flattened from side to side or variously curved like the blades of an Archimedean screw-propeller, bi-pinnately divided, and the ultimate divisions as in *C. Lawsoniana*, branched only on the distal side or the side furthest from the root. The leader shoots show a tendency to bend over at the top like those of the Lawson Cypress. The chief features are the robust habit and rapid growth—points which will render this form valuable, not only for ornamental purposes, but also for screens and hedges.

A fine symmetrically grown Wellingtonia, planted as a 1-year-old seedling in 1853, has now a girth of 9 feet at 3 feet from the soil. The lower branches have been removed to show the trunk—a procedure which has, perhaps, rather increased the already over-formal outline of the tree, but one which may be remedied in course of time, as the branches lengthen and again sweep the ground. What a contrast in form these pyramids of minute needle-like leaves make with the great standard Scampston Elm, with their dome-shaped heads and noble foliage—here, as it seemed to us, bolder than usual. If the Scampston is a giant among Elms, it has its counterpart in a little dwarf fellow, a form of *campestris* of similar habit to the Scampston, but fit to play dwarf to its giant. Close by is a magnificent Oak, just past its prime, perhaps, but so stately that, after all, we need not envy California her Wellingtonias, nor Australia her Eucalypts, in spite of their greater stature. The tree has an even, symmetrical bole, girthing some 18 feet at 5 feet from the ground. This Oak is by no means the only fine tree on these grounds—there are groups of Larch and noble Beeches, American Limes, a fine specimen of the Laurel-leaved Oak, *Q. laurifolia*, and many others.

After looking at these monarchs, and seeing what this part of Surrey can do in the manufacture of timber, it comes as a sudden surprise to see a fine plant of *Chamerops Fortunei*, so different does it look from anything British; but there it is, and in flower, too; and there it has been out-of-doors for the last seven years. Damp and wet settling in the crown would probably injure it more than frost, but a canopy of mats adjusted over the head by means of stakes obviates this danger. A great tuft of *Bambusa Metake* hard by somehow does not seem so surprising; the leaves are of less unfamiliar form, and they

look so hard and dry that one is not astonished to hear that it is quite hardy here. But what acquisitions are these to our gardens—what possibilities they afford to the landscape gardener!

Among the host of Ivies to be seen here, two in particular struck us. Of these one was called "canariensis azeica"—whether it has really anything to do either with the Canaries or the Azores is, we think, open to doubt. At any rate, it combines rapidity and freedom of growth with an absence of rankness; the leaves are on long stalks, lobed as in the Irish Ivy, but less coarse. The other is a "little droll," just the thing for a small rockwork. It is known as the "Milford Dwarf," and is in the way of the one called conglomerata, but very much smaller. It forms little bushes a span high, with tortuous erect branches and small, short-stalked lobed leaves, densely crowded in two ranks. What a study the Ivy is for those who are interested in the subject of variation! What a contrast between this delightful looking pigmy—a specialty of the Milford Nurseries—and the rampart, huge-leaved *Hedera Rogeriana*, for instance!

For those who like to see "how it's all done," these nurseries, with their hosts of seed-beds occupied with thousands of little Conifers and Rhododendrons, their frames crammed with grafts of all descriptions, their "clothes," their pits—all given up to the work of propagation—offer great attractions. It would lead us too far to go into these matters, a visit, moreover, is the most satisfactory way of obtaining information. Let us should be accused, however, of ignoring other departments, we may as well say that although we have picked out from our notes certain specialties, it must not be thought that trees and shrubs constitute the only features of this nursery; on the contrary, save and except stove and greenhouse plants there is not much in the plant way that is not here represented, and just as illustrations of this catholicity we may, in conclusion, note a perpetual flowering white *Antirrhinum*, a plant of good dwarf habit adapted for bedding and excellent for cutting purposes. Our other illustration shall be from the kitchen garden. Walker's Perpetual Beater Pea, a dwarf variety, sown on April 7, was here at the beginning of October laden with pods, flowers, and flower-buds, promising, would the weather only permit, a continuous supply of green Peas. Here is a variety that ought to suit the Channel Islands or other locality with a mild winter climate. Another character very marked by contrast with adjacent rows of other varieties, was its freedom from mildew. From landscape gardening to green Peas is a comprehensive stretch, nevertheless from what has been said it may be gleaned that here at Milford, while the two extremes are good, what comes between is in its varied way good also. *The Kambler.*

New Garden Plants.

ODONTOGLOSSUM HARRVANUM, n. sp.*

THIS is a grand and most unexpected surprise. The plant may well be compared with *Odontoglossum luteo-purpureum* and *O. tripudians*. But the flowers? Ah! they are novel, quite novel, though for a moment you might think of those of *Miltonia candida*—for a moment only—to do so longer would be a mistake. The dimensions of the bulbs and flowers are those of a good *Odontoglossum luteo-purpureum*. The flowers are in a raceme—"Of how many flowers?" you ask: who knows? I saw three, but the raceme was cut, so that you may as well dream of five, six, or, if you prefer, of a dozen. The plant looked as undeveloped as possible. Sepals rather broad, ligulate, oblong acute, undulate, brown with some hieroglyphical transverse greenish-yellow lines, which later on become intensely yellow, the whole surface is nearly green. The petals projecting straight forward, are a little narrower, undulate, with yellow recurved points, which is quite characteristic. They are brown in the middle, and have numerous mauve blotches and spots at the base on a white ground. The lip

* *Odontoglossum Harrvanum*, n. sp.—Pseudobulb pyriformi-rhizomati, rhizomati breviter, basi indiviso, pericostis duobus; foliis cuneato-oblongo-ligulatis-obtusatis pergamineis; racemo paniculato; bracteis oblongis acutis, ovatis pedicellatis; miltibus brevioribus; sepalis, sepaliqve heciliis obtuse acutis undulatis, lobis lobis obtuse truncatis, antheris late subcordato, pandurato apice abrupte longe acuminate-natis cordato, capsulis serrato-ligulatis-novenis-ante-basium; columnis trigonis, medio-angulatis, disci subaequaliter monteprominulis, callo quadrato de fovea breviter descendente. Ixoe: Harry Veitch discolor. Patria nobis (?) nota: Royal Exotic Nursery, Chelseaensis. *Il. ex. Riv. L.*

is rather similar in colour. The basil part of the stalk is yellowish, the median broader part is bordered with mauve, and marked with numerous mauve lines in front of the area, the crests being of the same colour. The crests themselves are seven to nine in number, serrulate and yellow. The anterior part of the lip is oblong, with an acute apex, white in the newly expanded flower, turning to yellow.

The outline of the lip is quite extraordinary. It consists of a narrow basil part, angled on each side; the blade being broad, sub-cordate, fiddle-shaped, abrupt at the apex, and prolonged into a long point. The column is angular in the middle, with a square projection under the fovea, white at the base, yellow at the top, finally yellow throughout. On each side of the column is a very small toothed wing.

This plant was imported by Messrs. Horsman & Co., of Colechester, from whom the stock has been acquired by Messrs. J. Veitch & Sons. It is a fresh type, and a very fine thing too. I have great satisfaction in dedicating it to Mr. Harry Veitch, as amid those numerous novelties I have obtained during the last twenty years from four members of this excellent firm, this is one of the most remarkable. *H. C. Rehb. f.*

DENDROBIUM HERCOSTOSSUM, n. sp.*

This lovely novelty is in the way of *Dendrobium aduncum* Lindl., a well known plant, and *Dendrobium Lingueila*, Rehb. f., a monopoly of Messrs. J. Veitch & Sons. It has a thin stem like those plants, scarcely exceeding a foot in length, furrowed, bent, bearing several lateral racemes at the top. The flowers are comparable to those of *Dendrobium aduncum*, but the chin is more oblique, the amethyst sepals and the petals more acuminate, the lip distinctly divided into a cupular hypochile with warts on the inside, and separated by a fibrillated keel from the ovate aristate epichile, white, apex amethyst. Column light green, with two lateral broad falcate retrorse side lacinie close to the dark purple anther. Lip comparable to that of *Cephalanthera rubra*.

I have to thank Mr. F. Sander for this lovely thing. He showed me the plant covered with flowers. It was discovered by Mr. Försterman in Malacca. *H. C. Rehb. f.*

A VALUABLE SUGGESTION.

"FROM four millions to five millions of souls go to rest in the city of London every night. This is equal to the entire population of Ireland. It takes an enormous quantity of food to supply such a teeming mass with green vegetables, and more particularly after a severe winter. Naturally they have to look South for early supplies, and the top prices with the 'first run' of Covent Garden Market have been maintained for years by Channel Islanders and Cornish men. For the last ten years the Scilly Islanders, with the aid of their esteemed landlord, have been competitors. When I read of 2s. 6d. per pound for early Tomatoes, and 1s. to 1s. 6d. per pound for early Potatoes, or from 15s. to £200 per acre, it may be asked with much force what the Cornwall of the country Cork, with its splendid climate, is doing in this direction? We should be up and doing, not of necessity for the London markets, but for our own Irish capital and Belfast, with all the northern counties of England, including Glasgow and Edinburgh. Glangarriff and Crookhaven are two degrees more advanced in spring than we Cork folks are, and four degrees more so than Dublin; six or eight degrees difference with the country over the Tweed. If climate favours the Cornish man, so that they now have the 'monopoly' of Covent Garden Market, we have been simply asleep for years in not developing our railway communication, and setting the thing going. Now that we have railways and tramways, let us put on a bold face, and ask the Government for State assistance in the way of model schools of education—large self-supporting market gardens, with plenty of glass coverings that will help us to be educated in all the detail from Potatoes to Grapes and Pine-apples. The peasantry know nothing about it, the state of the

landlord is too uncertain, private companies will not do it, the Government can, with the schools mentioned, and let them have Channel Islanders and Cornishmen as instructors. I should say, one concern at Clonakilty and the other near Bantry. We need not fear frost near the sea for early Potatoes and flowers. Screens and hedges of *Escallonia macrantha* will ward off any amount of sea-breeze. All sorts of soft-wooded plants live out all winter at the Eccles Hotel Gardens, Glangarriff. Ten years ago this land fed nothing larger than a snipe, but since Mr. Preston White reclaimed and brought it into cultivation it is producing some of the finest vegetables in the kingdom.—

'The reproach of barrenness is past,
The fertile field laughs with abundance.'

In ten or twenty years what a change would be made among the peasantry, when they could work their own 'warm nooks' and districts, and be happy and contented. £50,000 would be well spent in this direction. The coral sand of Bantry Bay (the supply of which is inexhaustible) ought to be brought into the interior of the country by the railway at mineral rates, as it is an invaluable manure.—

The above article, by Mr. W. Bayler Hartland, of Cork, appeared in the *Horticultural Times*. Mr. Hartland writes to us—

"Since writing the above I have been reading what Mr. Boddy, the working carpenter of 1876, has been up and doing with 10 acres of a reclaimed bog at Land's End, Cornwall, and how last week he sent a consignment of delicious Grapes to Her Majesty as a presentation, getting the royal thanks and congratulations. Mr. Boddy has made, within ten years, one of the most successful market growers in Cornwall; and what was ten years since a bog or waste is now a garden with extensive glass constructions. Surely the new Irish Commissioners could recommend the grant asked for in my letter, and let us be up and doing, making as much in early spring with our produce as would recoup us for the whole year's expenditure. We have the climate and the railways. Look at the advantage it would be to the West Cork Railway. They should meet the enterprise with cheap through freights to Glasgow and the North of Scotland, with Belfast and Dublin."

ROOTS.

(Continued from p. 457.)

A THIRD case is conceivable—so much water might be supposed to find its way in that no air remained in the interspaces between the particles of soil. Now it is true that such a state of affairs is not readily brought about in a normal soil; but I may indicate how the result is occasionally attained to a great extent. Suppose that a layer of clay or other impenetrable subsoil lies beneath the soil in question; then if water oozes into the soil in larger quantities than can be got rid of in the time, it is possible for nearly all the air to be displaced. Of course the object of good drainage is to prevent this; and it is often overlooked that drainage from below has the effect of drawing in air as well as of running off superfluous water—air is driven into the spaces as the water leaves them.

In speaking of the "bubbles of air" entangled in the interspaces between the particles of soil, each with its water-blanket, I have overlooked some details as to what the bubbles really are. As a matter of fact they will not remain of the same composition as ordinary air, and may soon differ considerably; besides the vapour of water, they may contain gases in quite different proportions from those in the air outside. In the type case, however, there will be some oxygen present in the bubbles.

ROOT-HAIRS.

It is not intended here to go very fully into a description of the roots of land-plants; enough if you are reminded how the smaller ramifications of a root are found to be more numerous and thinner as we approach the periphery of the mass of earth which they traverse. From the youngest rootlets are produced the root-hairs, in enormous quantities, new ones arising forwards—i.e., near the tip of the rootlet—as the rootlet grows on, and those behind dying off after fulfilling their functions. These functions are chiefly to apply themselves in the closest manner to the surfaces of the particles of soil, and in this way to place the water which they contain in direct continuity

with the water which clings with such enormous force to the surfaces of the particles. Hence this water can pass from the soil to the plant, and anything dissolved in the water can also pass into the root-hair, and thus up into the plant.

I am not going to dwell on how the root-hairs themselves aid in dissolving mineral substances—corroding the surfaces of the particles of soil they cling to—nor shall I trouble you with the details of what substances will be dissolved in the water; for, of course, you will see that anything soluble will pass into solution and may be carried into the plant.

The chief point to be insisted on just now is that this water in the soil will contain among other substances oxygen dissolved in it from the air-bubbles referred to above, and that this dissolved oxygen will pass into the root-hairs in solution together with the minerals and any other substances. This oxygen, moreover, is absolutely indispensable for the life of the root-hair; it can be easily shown that if the supply of oxygen is stopped, or even diminished to any considerable extent, the roots begin to die, because the root-hairs cease to act.

Let us look a little more closely into this point. Each root-hair is a tiny cell containing living protoplasm and certain other substances, all enclosed in a thin, elastic, porous membrane. Now it has been abundantly proved that if such a cell is deprived of oxygen, its protoplasm becomes dormant for a time, and slowly breaks up, as it were; subsequently it becomes decomposed into other and simpler materials. A sort of internal combustion and fermentation take place, and these processes result in the formation and liberation of bodies like carbon-dioxide, alcohol, acetic acid, and other acid matters—substances in the main not only incapable of supporting the life of the root-hairs, but actually destructive of it.

Evidently, then, if we deprive all the root-hairs of oxygen, they will eventually die. Their death will entail that of the rootlets and roots to which they belong, and this for two obvious reasons—first, it is the root-hairs and the root-hairs alone which can absorb the necessary water and substances in solution from the soil to supply such a plant as we are concerned with; and, secondly, the noxious products resulting from their death accumulate in the soil and diffuse into the root, and so hasten similar decompositions in what were hitherto healthy cells.

It must not be supposed that these disastrous consequences of the deprivation of oxygen always follow immediately. Not only are the roots of some trees, for instance, able to withstand ill-treatment longer than others, but, obviously, the kind and degree of ill-treatment may affect the problem of how long the plant shall survive. The number of rootlets and root hairs, and the spread of the roots and other factors, will obviously affect the matter.

Suppose the following case as an example. A young tree is growing and flourishing in an open, good soil, and, for some reason or other, more soil is heaped about the roots until the depth is increased considerably; the deeper situation has placed obstacles in the way of the roots obtaining oxygen so readily as before. Not only are the roots further from the atmosphere, but the water carried down has to percolate through more soil, and may part with much of its oxygen (or even all) on the way; of course the nature of the soil, the presence of organic matters, and other circumstances, decide this. It is not at all difficult to conceive of such a case where the supply of oxygen to the roots is thus diminished so far that the activity of the root-hairs as a whole is simply lowered, but not destroyed,—a stage or two further and they might become dormant, and their protoplasm undergo intra-molecular respiration for a time, and break up. It is clear that the diminished activity of the roots will affect the supply of water (and the substances dissolved in it) to the leaves; this will obviously react on the thickness of the annual rings, and this again on future supplies—since the water passes up the alburnum, or young outer layers of woody tissue. Moreover, a diminution of supplies from the leaves means less substance and power for replacing the root-hairs, and so on. In this way it may require some time to kill the tree, and all kinds of complications may arise meanwhile. This case is probably by no means uncommon.

A more extreme case is where the soil becomes damp and clogged with excessive moisture; not only does no oxygen reach the roots, but noxious gases

* *Dendrobium hercostossum*, n. sp.—Att. *Dendrobium aduncum*, Lindl., ex *Lingueila*, Rehb. f.; caudibus teretibus, sulcatis, apicem versus statura delatato-racematis; foliis . . . racemulis paucifloris; mero obliquo nec rectangulari; sepalis triangularibus acuminatis; tepalibus oblongis acuminatis, lobellis trifidis laciniis lateralibus semi-oblongis hypochilum semi-oblongum efficit; tubus, intus callis minutis asperum, carina margini superiori effilata supraducens ac. marginem intum laciniam lateralem, epichilo ovato aristato; columna intum laciniam breviter ac late falcata. Malacca. *H. C. Rehb. f.*

accumulate in solution in the soil, and will hurry matters by poisoning cells which might otherwise live a longer life of usefulness. It is extremely probable that such gases find their way into higher parts of the plant in the air-bubbles known to exist and to undergo alterations of pressure in the vessels of the wood; this being so, they would slowly retard the action of other living cells, and so affect the upper parts of the plant even more rapidly than would otherwise be the case. Damp soil may thus do injury according to its depth and nature; but it need not necessarily be deep to be injurious if much oxygen-consuming substance is present. I have seen excellent soil converted into damp, stinking, deadly stuff, from the action and accumulation of the larvae of cockchafer: these "grubs" may, it is true, accelerate the devastation caused by the consumption of oxygen and the accumulation of poisonous waste matters in the soil by directly cutting off portions of the roots themselves, but the accumulation of oxygen-consuming substance, and the cutting off of supplies to the root-hairs evidently plays a chief part in the destruction.

There is another matter with regard to damp soils that cannot be left out of account. I have already told you that roots which are developed in water, or in very damp sandy soil—and which are perfectly healthy—have few or no root-hairs formed on their surfaces; whereas it may be readily shown that the roots of the same plant growing in a well aerated open soil, which is scarcely moist to all appearance, will be densely covered with a close set pile of hairs. Indeed it is by means of the millions of root-hairs on its rootlets that a Sunflower or a Bean, for instance, obtains the enormous quantities of water necessary for its needs from soil which, to our rough perception, seems to be dry.

I cannot here go into all the proofs that such a soil is by no means so dry as it looks; but will simply remind you of what was said above as to the enormous force with which the minute particles of rock, &c., which form "soil" retain their hold on the thin films of water which constitute what have been termed their water-blankets. This is certain, that a healthy, well-rooted plant can take up water from a soil which is to all appearance air-dry; whereas a plant which has not yet had time to develop its root-hairs in sufficient numbers to take these firmly adherent water films from numerous particles of soil, would droop and wither.

Of course it must be borne in mind that we are speaking of land-plants such as we commonly meet with on ordinary dry land; in the case of plants which flourish in bogs or in water there are corresponding differences in the structures of their roots agreeing with the differences of environment. Even such plants need air at their roots, and an excellent illustration of this is afforded by some Willows. Our common Osier and Willows grow, as you are aware, in low-lying, damp, and even boggy places, often flooded; now, it has been found that, if young Willows are planted too deep in the soil, they very soon send out new roots—adventitious roots they are often called—close to the surface of the soil, and these roots soon do all the work. There is no doubt that this power enables these Willows to live in places that would be fatal to them otherwise; and the same is true of some other plants.

Enough has now been said to show you how necessary it is that some care should be exercised in watering plants, or in exposing them to conditions different from those to which they are accustomed; and, it need scarcely be added, apparently mysterious diseases may sometimes be explained when it is shown that such precautions have been neglected. Any one can quote instances of plants which will grow in some soils and not in others, but no very satisfactory reason is afforded by simply saying that the one soil is suitable and the other not; however, all I have attempted to show you is that some soils are not suitable for some plants because the plants in question need more air at the roots than these particular soils can afford them under the circumstances. *H. Marshall Ward, M.A., F.L.S.*

(To be continued.)

GHIBBERNE. — Sloppy pavements in town and sodden soil in the country remind us that we are on the threshold of winter; and to still more force the fact on our notice come the now yearly reminder in the form of boxes of PRICK'S Ghibberne, in which we may remind our readers, no better dressing for sheep-cather exists.

THE SNOWY MESPIUS.

In your issue of May 22, p. 656, I note that you call attention to some fine examples of the Snowy Mespilus (*Mespilus canadensis*, A. Michaux, *Flor. Bor. Am.*; M. arborescens, A. Michaux, *Nth. Am. Syl.*) growing in the Sydney Gardens, Bath. You do not give the dimensions of these trees, but I question whether there are any finer examples than a couple we have growing in the pleasure grounds here (see fig. 98, p. 489). I measured the trunk of one of these trees the other day, at 3 feet from the ground, and found its girth to be a trifle over 4 feet. This tree is fully 30 feet high, if not more, and nearly the same in diameter, that is, through the spread of its branches, and moreover it is as healthy and vigorous, and handsome in shape, as it is possible to wish for. The other tree is only slightly smaller. It is conjectured that these trees were planted here upwards of 150 years ago by the then occupier of this estate, who, I am informed, was in some way connected with America, hence the existence here of not only these but also, on the authority of Sir William Hooker, a pair of the finest specimens of the black Hickory (*Juglans nigra*) that are to be met with in England, and, un'il a year ago, a remarkably large and handsome specimen of the Sugar Maple (*Acer saccharinum*). The latter tree seemed as vigorous as ever the previous year, but owing to some unexplained cause it failed to show the faintest signs of growth the following spring. On cutting it down late in the summer we found the central pith decayed at least two inches in diameter. This beautiful species deserves to be more generally grown than it is, for few—if, indeed, any—of its class, possess such beauty of contour; its handsome, delicate, deep green leaves, slender petioles, graceful branches, and silvery bark rendering it one of the most strikingly beautiful trees for growing as isolated specimens.

Referring again to the subject of this note, I may state that the specimens (*Mespilus*) are growing on a shallow dryish soil, overlying the Blackheath deep gravelly subsoil. According to Michaux, in his excellent work, the *North American Sylva*, the species prefers a shady moist situation, being found, in its native habitats, growing on the banks of streams and rivulets. The same writer states that it rarely exceeds 35 to 40 feet in height, so that our examples may be considered as having well-nigh attained maturity. I note, too, that Michaux states that the largest trees in their wild state bear half a pound weight of its attractive and agreeably-tasted fruit. This accounts for its failure to produce fruit in cultivation; and although our trees are, as you so truthfully describe, "laden with flowers heaped up in happy plenteousness," yet not a single fruit has either my employer (who, by the way, is greatly interested in arboriculture) or myself ever seen. To be seen in its full floral beauty this charming tree requires a background of lofty trees, as in our own case; this adds greatly to the effect produced by such harmony and association.

There are a vast number of really beautiful trees described and illustrated in the *North American Sylva* that ought to find a home in every garden capable of growing such noble and magnificent examples. *T. A. Sanders, Gardener to J. N. Larking, Esq., The Firs, Lee, S.E.*

MARKET GARDENING.

FRUIT AND VEGETABLE FARMING *v.* PROFIT.—A year or so ago one of the foremost amongst modern statesmen suggested fruit growing as a remedy for the ills that cultivators of the soil and others have to contend with. Doubtless on the recommendation of so high an authority many holders of suitable lands, who hesitated previously, commenced planting fruit trees. In any case more persons have consulted me during the past year or two than at any time previously as to the actual prospects attached to fruit tree planting and growing hardy fruits generally for the home markets, added to which many intending planters have written simply asking for lists of varieties of fruits, chiefly Apples and Pears, suitable for marketing purposes.

I have not hesitated to advise the utmost caution in regard to all enquirers who seem inclined to risk much on ultimate success. I have suggested that even long leaseholders should secure suitable markets at remunerative prices before entering too deeply

upon such highly speculative work. This advice being based on the facts, that young fruit plantations of such kinds as Apples, Pears, Plums, and Cherries take too long time to arrive at such a state of maturity, as to, under more favourable circumstances than really exist, recoup tenant planters the outlay made, when considerations of conservation from birds, &c., gathering, baskets, transit and commission, are fairly calculated in addition, as a set off against the actual returns of crops.

In regard to bush fruits matters are not much more promising as regards results. These fruit bushes may be planted with a certainty of quicker returns, though good market prices have ceased to be the rule for excellent fruit from old established growers; and there is but small hope that beginners at the trade will be able to do so well as they.

It will be well, moreover, in connection with this phase of the subject, to explain that, whilst well grown produce, ably marketed, may hope to vie with the latter as regards prices, it will prove anything but a remunerative speculation to grow moderate quantities of fruit, in addition to other branches of farming. Moreover, unless the grower is his own salesman, the wool will not be worth the cry, and he is not likely to realise good returns for his crop.

It may be asked, why so great a disparity should exist between demand and supply, seeing the extent of population and the limited area of land under fruit culture within these islands?

Several causes can be pointed out, though it would be difficult to enumerate all. The importations of foreign fruits, though advantageous to the residents in the metropolis and all large towns, prove very injurious to the home growers' interest. The cost of transit as shown in the comparison between prices charged for the carriage of foreign fruits and that of British, terribly handicaps home growers besides. Railway companies charge as much for the carriage of such goods from Kent to the metropolis—if not more—than for an equal weight consigned from a sea-coast town. Indeed, by through carriage in express trains the foreign consignments are conveyed at extremely low prices. By this means foreign fruits inundate our markets before the home grown crops are ripe, hence the latter realise only inferior prices.

There is besides another fact connected with these consignments and the foreign fruit industry, which must not be overlooked. Apart from the fact that land is cheaper, tithes and taxes lower, seasons more equable, and labour cheaper, foreign growers are well satisfied with a very low scale of profits. For instance, they persist in sending their produce at auction prices; and there cannot be any question that a profit of 2*l.* up to 6*l.*, per parcel satisfies them well. Take, by way of illustration, the French baskets of fresh Plums: the baskets alone, with lids fitted, &c., are generally sold empty and second-hand; by the original purchasers of the Plums, at 6*l.* each. Yet these baskets (filled with selected fruit and in measure more than half a sieve) are sold at our markets for 2*s.*, or more or less. If the gathering and selecting of the contents of each basket, carriage beyond sea to rail or boat, commission on sale, &c., is taken into account, it will be seen that I have not understated the case.

Apart from the quality of the fruit these are the more readily saleable, both wholesale and retail, owing to the fact of their being first fruits. By this mode all subsequently gathered fruit of English growth are made seconds. It matters not how good the quality of the latter may be, consumers do not care for them after the first flush is over. Nor is it enough to rob home growers of their undoubted rights in this way, for a practice is gaining ground of packing foreign fruits in English baskets and selling them as home grown. This is more particularly the case with the green French Plums which first arrive so neatly packed in wooden boxes. As the crops ripen they are sent over in greater profusion, and are transposed, as stated, to other baskets, and palmed off on the public as English Gages, by which is meant Green Gages, though they are very inferior in quality to the latter.

If we take into consideration the rent of good land, tithes, rates, and labour, along with the too general unkindly spring weather experienced, it must be seen that the home grower labours under much disadvantage. I maintain, as a grower, judging crop for crop, supposing it is well secured by the home grower, not only has the foreigner the advantage in our markets, but beyond that, holders or owners of

matured orchards do not find them remunerative; how then is it possible for planters to expect to profit greatly by planting new ground with the same?

If we take the varieties of fruit *serialim*, we find Plums proverbially "give good crops once in ten years." We have an illustration of what a good crop is this season. With the trees bearing very heavy crops of fruit the growers' hopes may be allowed to rise; but in reality, however, his profits are next to nothing. Apples, too—a very uncertain crop generally—are mostly either very thin or very heavy over large areas of the country. In the former case large trees, even though dotted over with a partial

not be attempted; and for this reason, that unless a "bird tenter" can be maintained from break of day till dusk during the whole time the fruit is ripening together with a certain expenditure of gunpowder, it is useless to expect to save the crop. Even good well-grown Cherries do not commend themselves. I have sold, years ago, Morellos so grown, at 1s. 6d. per pound; the best offer I could obtain for a cwt. of these this year was "a shilling a dozen" (1d. per pound.)

As regards Pears I assume there is no risk of new growers burning their fingers by planting too extensively. Notwithstanding the influx of Jersey

look is anything but cheerful, either present or prospective. It may be interesting to refer in this place to the matter of grower *versus* consumer. Though wholesale prices are so low consumers unfortunately do not generally benefit. I will, by way of illustration, take Raspberries as being more exclusively English grown than other kinds of fruits, and hence less likely to be influenced one way or the other by foreign produce. I have shown that the nominal wholesale price during the present season has been 3d. per pound, and after the rains came, in certain instances, sales could not be effected at that; yet consumers within the large area of the western and southern

FIG. 98.—SNOWY MESPILUS, AT THE FIRS, LEE, KENT. (SEE P. 488.)

crop, pleasing to the eye, prove very bad basket fillers. I have just had five fine large young thrifty trees of Dumelow's Seedling (Wellingtons) gathered, and the result is a sieve and a half. Even if the fruit fetch 18s. per sieve, as they sometimes do during bad seasons, the result will nevertheless prove very barren as to returns. On the contrary when good crops abound, these, like the Plums, give wretchedly bad returns, and Cherries furnish a similar result. With a good crop such as was experienced this season, we have seen them sold retail in London at 2d. per pound. Few growers would care to gather them for this money, yet how greatly is even this sum reduced by the time it reaches them. Cherry growing, except in the form of large orchards, should

"Williams" good samples grown in this country fetch fairly good prices, but no reliance can be placed on securing a crop.

Small, or bush fruits show great fluctuations. All have fallen considerably in price during the last five years. Raspberries I have sold at 1s. per pound, and as I gathered 1 cwt. from a piece of ground measuring 27 yards long by 26 yards wide, a return of £5 12s. was an exceptional profit. Latterly, however, 3d. per pound has been the nominal market price, and as the season advanced this year this was not obtainable, indeed, instances occurred where they could not be obtained at any price. Gooseberries have not repaid, in many instances, the cost of gathering.

But I need not follow the subject further: the out-

skirts of the metropolis were all but invariably charged 1s. per pound for them.

Why this great disparity between wholesale and retail? It is not far to seek. Retail sellers have each their round of customers the generality of whom are ignorant or unconcerned as to the abundance of supplies first hand, and who are charged at the higher prices. They continue to cater for these alone; given so much mixed produce for so many good customers, and they require no more. It is not to their interest or convenience, however cheap or abundant fruits and vegetables may be, to purchase double quantities at low prices, and to cart them home for the benefit of customers. They know, too, that low prices at one time militate against good prices gener-

ally, and thus the interests of sellers and buyers are placed in direct antagonism. Nor are the sellers really to blame; they have, taking all seasons together, many risks to undergo, beside having the particular characteristic of their countrymen—a desire to make their fortunes as quickly as possible.

The fact remains, nevertheless, that the interests of growers and consumers are identical, and no effort should be wanting on the part of both to come into more direct communication with each other. How this is to be brought about is a difficulty that will have to be met. It may be said, however, that consumers are to blame for not going to the wholesale markets when they require sieves of fruits of any kind, and by not endeavouring to effect wholesome reductions by arranging with their green-procure beforehand. Unlike other trades, I have not observed there is anything like a "ring" at any of our great vegetable and fruit markets. Buyers able to take care of their own interests can buy at market prices, and they will do well to make an early morning trip for trial, when a very interesting sight will meet their view.

As regards vegetables, precisely similar differences exist between wholesale and retail prices. During the present season Kunner Beans frequently have barely repaid the price of picking. Vegetables Marrows and Cabbages often only fetching 1s. 6d. a tally, or by weight 1d. for about 20 lb. of produce! Assuredly the *land must grow* by very superabundance ere growers can recoup their heavy outlay at such prices. Figures will more than corroborate my statement. I give here a copy of a Covent Garden salesman's return to a grower, for produce sold:—

To 5 tallies Vegetable Marrows sold	4. d.
Per contra:—Carriage .. 3 6	7 6
Commission	2 6
6 3	6 3
Profit returned to grower	1 3

This does not include the cost of gathering, packing, wear of baskets, &c., to say nothing regarding the outlay of growing, &c., and if growers' expenses are, taking the year throughout, barely met, where ultimately is the rent of land to come from? *William Earley.*

ODONTOGLOSSUMS.

It is interesting to read of the very successful management of *Odontoglossums* out-of-doors in Mr. Sme's garden (see p. 424). It is there stated that *O. ciriosum* did better out-of-doors than *O. crispum*. Probably some may infer from this that the first named is the hardier of the two, and that it is likely to do as well or better in the cool-house than *O. crispum*. We have grown it very successfully in our collection ever since it was introduced, but I was not long in finding out that it required a higher temperature during winter than *O. crispum*, or at least it requires more sunlight. If the house is an airy span-roofed one, well exposed to the sun, the plants do not suffer from the low temperature, but they will do so from one where the sun does not shine upon them at all for three or more months in winter. The leaves continue to die off at the points all through the winter until they are quite unsightly in a low temperature and no direct sunlight. This I have proved by removing some of the plants to the Cattleya-house and leaving others in the cool temperature. They are now making their growths, and will continue to do so during the winter; and it is quite natural that at that time they should have as much sunlight as they can get during the late autumn and winter months, but failing that a minimum temperature of 55° is better than one of 45°. In the higher temperature they make large bulbs, which throw up at once grand branching flower-spikes. It flowers during March and April, and in this respect is different from *O. crispum*, which is never out of flower, making its growths at all times and seasons. *O. crispum* will grow and flower well year after year in a lower temperature than any other species known to me, but the question with most people who value their plants is, not how low can the temperature be kept without injuring the plants, but what temperature is best? In a sufficiently heated and well constructed Orchid-house the difference in the cost of fuel to keep the minimum temperature at 50° instead of 45° is not worth consideration at all; on the other hand, if it could be demonstrated that the lower temperature is best for the present and future of the plants, it would

be easy enough to give them 45° instead of 50°. The *Odontoglossums* and other Orchids from the mountainous districts of South America are maintained in health by studying other requirements of the plants as well as temperature. We read of them being enveloped in mist in their native habitats, and are too ready to come to the conclusion that an atmosphere saturated with moisture night and day is best for the plants, but we forget to take account of the difference between our plants with their artificial existence and that which they enjoy in the free air of their native mountains. The plants exist there under conditions in which they will naturally grow and increase freely; we can never expect to imitate them. I have grown cool Orchids under various conditions for many years—it does not matter how many, but long enough to find out, that growths of *Odontoglossums* made in a close, moist atmosphere in winter, are much inferior to those made in a more airy house and a moderately moist atmosphere. Sometimes the difference of placing a plant on the stage, or suspending it from the roof, makes all the difference between success and failure. The small-growing species, and those with soft growths, such as *O. nebulosum*, do best quite close to the glass roof. I would like to remark, further, that no cultivator of Orchids need expect to be successful by imitating some one else. The treatment required in our houses may not do in another. I can give an instance of this in the case of *Lycaste Skinneri*.

Perhaps no one ever grew this species better than Mr. John Ward when gardener at The Poppars, Leyton. The plants grew into great specimens in quick time. Our cool-house is the same form, and our plants are grown very much as Mr. Ward grew them; in fact he saw the house and the plants, and told me it was so, and yet they will not even do well with us in that cool-house, probably because some small detail is neglected, or some of the internal or external arrangements of the house are not right. We grow this species very well in another and warmer house.

I stated some time ago that *Odontoglossum Rossii*, *O. membranaceum*, and some few others of this type (of which the supposed hybrid forms *O. Humeanum* and *O. asperum* are included) did remarkably well in our cool-house, summer and winter; they are doing well now. Some one writing in the *Gardeners' Chronicle* took exception to this, and stated that they required warmer treatment. This is sufficient evidence that, given a fair general training in the culture of Orchids, every one must to a certain extent feel his own way, and find out from his own practical experience the special requirements of each individual specimen; and this can only be done by unremitting attention and watchfulness of the changes in the health of the plants. The quick eye of an earnest and experienced cultivator can soon tell whether there is any change in the plants for better or for worse, and will not be slow to take prompt and decided action. *J. Douglas.*

LUTON HOO.

This fine house and garden, the residence of Mr. de Falbe, Danish Minister Plenipotentiary at the British Court, are situated on rising ground, at a short distance from the Midland Railway, from whence the traveller can see the mansion and its background of trees, and is about midway between the emporium of straw plait, Luton, and Rothamsted, of agricultural notoriety. Aged timber abounds in the park of 900 acres, but the main proportion of the plantations, which are young, were formed by the late Mr. Leigh, within the last forty years. The planting, in so far as could be observed in a day's ramble, is generally successful, the belts an I groups having formed effectual shelter to what was formerly a somewhat bleak and bare hillside. The roads that intersect the property are broad, well made, and of bold outline, whilst the stretches of park land on each side are not frittered away by searching for effects or by the mistaken dotting and small group method seen in some modern examples of landscape planting.

In the neighbourhood of the mansion, a rather plain building in stone and stucco, fine Cedars abound, especially *C. Deodora*, and as these stand apart from any other trees, their symmetrical forms and healthy appearance add no little effect to the garden landscape. A specimen of *C. atlantica*, of grand proportions, stands not far from the north-eastern end of the terrace, and is probably one of the finest in the

country. *Sequoia gigantea* (Wellingtonia) forms a noble tree on this soil, and several are found at various points of vantage near the house; other Conifers consist of *Abies Douglasii*, *A. obovata*, *A. Pinsapo*, *Pinus excelsa*, all of them of goodly proportions. Little change of any kind has been effected in the immediate vicinity of the flower garden; the broad expanses of lawn remaining as they were originally planned. Owing to the adoption of the ha-ha wall the stretch of lawn appears almost endless, looking towards the north, only coming to an end with the distant woods and cultivated upland fields.

The flower garden, that was originally on the north of the mansion, has been removed to the east side, and with the obvious advantage of having the near neighbourhood of trees and shrubs to act as a setting, instead of the indefinite hazy finish of continuous grassland, as in the former case. The beds are large and not numerous, the *Pelargonium* being largely employed for its brightness of colour.

Carpet beds do not find much favour owing to their want of colour and the difficulty with which the pattern can be discerned at a little distance off.

A feature of the flower garden is the number of fine Bay trees in tubs which stand about. These are in great vigour, and formed dense cones and globes, some of which measured 9 feet in diameter.

Dahlias of various kinds, single and double, are much employed, and the finer border perennials find place in the foregrounds of shruberies and in parterres set apart for these—indeed they are indispensable in a place where cut flowers find so many uses; and flower borders are found not only about the flower garden itself, but by the sides of the kitchen garden paths and of glass-houses of various kinds—indeed, wherever a favourable site can be obtained, and all are planted with the one idea, that of furnishing flowers for use for indoor decoration.

The kitchen garden is worthy of the place, being 12 acres in extent, divided into two main areas, one of which is octagonal in shape. This season the fruit crop has been very abundant on trees of every kind and in most aspects, which, as regards the walls and in and outside the octagon, were very varied. Trees of either standard or pyramidal forms line the cross paths in these gardens, the latter finding general use as boundaries to the vegetable quarters. The high site of this part of the estate is, in dry seasons, the cause of a great want of water, so that vegetables often suffer much in the late summer months.

The numerous glass-houses are distributed in groups and ranges in various positions, one long range occupying the northern boundary, with all the necessary offices, sheds, boiler-house, hotby, packing sheds, and fruit-stores in the rear. The arrangements are most commodious, admitting of the carrying on of the work of a large garden with but little loss of time and labour.

One of the prettiest of the houses is one planted with *Roses*—hybrid perpetuals and *Tears*. The house is of quadrangular form, 30 feet by 50 feet, and of considerable height at the sides. Standing apart from any other, the house has a handsome appearance, and the interior during the months of March and April is a picture of beauty rarely met with. The inmates, mainly planted out in narrow winding borders and small beds, are grown in the pillar, bush, and climbing forms.

There are at present seven houses devoted to Vines; *Black Alicante* and *Lady Downe's* occupy a house in which Mr. Baillie, the gardener, has found it necessary to entirely remake the borders, the work having been very inefficiently done at some previous time. In one house *Muscats* were carrying a good crop, and there was no shanking; in another *Heliotrope* President Garfield covered the back wall, furnishing abundance of fragrant bloom for bouquet purposes. In the front young Vines of *Black Hamburg* were doing well, and at the back part of the inside border a row of *Tomatos* in full fruit had reached the roof. One more house was planted with *Black Hamburg* Vines, which had been prepared in an uncommon manner, that have made great progress since being planted. The plants had the whole of the earth washed from the roots, which were then spread over the surface of a wooden raft with a covering of 2–3 inches of soil. A month afterwards, in May last, these Vines were planted out in large shallow holes and treated in the usual way; their growth has exceeded that of any others by quite 6 feet in length. One large viney was well furnished with splendid bunches of *Caros Colmar*, a Vine or two of *Alwick*

Seedling, which the gardener does not like, occupying one end. This vineyry has also had the border renewed.

A vineyry originally filled with Black Hamburgs, which succeeded admirably, has had the Vines worked with the showier Gros Colman, fine bunches and berries being here preferred to the more modest excellence of the first-named variety. A house of Fig trees in tubs is one of the sights of the gardens. The plants will average 8 feet in height, and occupy a house entirely to themselves, standing in two long lines on the border. These cylindrical bushes are wonders of fruitfulness, Thompson's Vine manure and stable manure assisting to maintain them in health. The sorts consist of the following:—White Naples, White Ischia, and Drown Turkey, the latter being preferred. A house in which are Palms, and another for Ferns, all with the idea of affording plants for indoor furnishing, were observed, filled with the usual species and varieties. There are small houses and divisions for the cultivation of Calanthes. Tree Carnations, tuberous varieties of Begonias, and *B. nitida*, zonal Pelargoniums, Roses in pots, Eucharis amaranica, a mixed collection of hot-house plants, and a small collection of Orchids of ordinary kinds, although of these latter a beginning of better things was observed in some finer species and varieties lately purchased.

The kind of cultivation carried on at Luton Ho is that of the production of masses of a few "useful" plants, good for a certain purpose only; and but few plants of anything rare or remarkable are found in the many houses. This is to be deplored, as, with all its abundance, there is a certain lack of the interesting in horticulture.

Order, neatness, and good culture are visible on every hand, the place having decidedly advanced since the appointment of Mr. Baillie to the post of head gardener, about eighteen months ago.

GARDEN PALMS.

(Continued from p. 557, vol. xxx.)

MANICARIA, Gertner.—There are about two species in this genus, both of them natives of South America, where their gigantic size are largely used as a thatch.

M. sacifera, the Troolie or Bussu of British Guiana, is the only one known to be in cultivation in Europe, but it is as yet represented only by very small plants, being difficult to keep in health, and as it is not particularly ornamental when young, probably no effort has ever been made to obtain and establish large specimens. There are several 4-year-old plants at Kew, and these were raised from seeds; they thrive only when kept in a very warm and steamy house, and liberally supplied with water. Although not attractive when young this Palm is one of the most striking and singular in appearance when mature. Its stem attains the height of about 15 feet, and is often crooked; the lower part is marked with closely set scar-rings, whilst the upper is covered by the broad persistent bases of the petioles, and crowned with numerous semi-erect entire leaves, often 30 feet in length and 5 feet in width, the margins serrated, and the blade here and there split when old. The form of the leaves is that of the largest leaves of *Musa Essete*, but as they are rather rigid, channeled, and point upwards, the whole plant presents an unique appearance. The drooping spadices are produced in the axils of the lower leaves, and are enveloped in curious cloth-like spathes, 3 feet long, and shaped like fool's-caps, and, according to Wallace, these spathes are much valued by the Indian, furnishing him with a durable cloth. Taken off entire they form bags, or may be used as caps, and even as landing nets by fishermen. The seeds are usually enclosed in three or four corky 3-lobed shells, the cork-like covering being broken up into angular gibbosities; the seeds are round, smooth, black-brown, 1½ inch in diameter, and hollow like a Cocoa-nut, which they also resemble in that they contain milk. The creoles in Demerara greedily drink this milk, which they consider to be an unfailing remedy for coughs and asthma (Im Thuro). Seedling leaves bipartite, dark olive-green. This Palm is found only in tidal swamps, and is therefore not easily accommodated under cultivation. It would be a grand Palm for the collection at Kew if a full-sized example of it were possible. The second species,

M. Plutendii, is supposed to be found in Trinidad and Guatemala, and, according to Sereno Watson, it is pretty clearly distinct from *M. sacifera*, which, till

recently, was considered the only species. There is probably some confusion of the two species in botanical works.

MARTINESIA, Ruiz et Pavon.

In the *Genera Plantarum* it is stated that seven species of Martinesia have been enumerated, in a recently issued number of the *Botanical Magazine* fourteen species is the number given. Five of these are in cultivation, but they do not find much favour as ornamental plants owing to their requiring a high temperature, and to their lack of distinctive beauty when young. *M. caryotefolia* is the best known kind, and it has been cultivated in England many years; a plant which flowered at Kew last year, and was figured for the *Botanical Magazine*, having been grown from seeds collected by Purdie in 1845. This plant is about 12 feet high. None of the species form large trunks, 30 feet in height by about 9 inches in diameter being about the limit. They are all more or less clothed with rings of blackish spines, as also are the petiole and rachis. The leaves are borne on the top of the stem, where they form a rather thin but gracefully arching crown; they are about 5 feet long, pinnate, the pinnae broad, about 1 foot long; the apex broad, lobed, and truncate as in *Caryota* and *Wallichia*; seeds globose, smooth, half an inch in diameter, and reddish-yellow when fresh; seedling leaves bipartite. Being all natives of the tropics of South America, these Palms require stove treatment and plenty of moisture both in the atmosphere and at the root. They are healthiest when allowed a liberal amount of root-room. In some botanical works this genus is sunk in *Aiphanes*.

M. Aiphanes, Kl. (*Aiphanes aculeata*, Willd.).—Caracas.

M. caryotefolia, H. and K.—New Grenada. *Bot. Mag.*, t. 6854.

M. disticha, Hort. (=*Leucophoa*, Hort. ?)—Hab? *M. oroa*, Hort. Lind.—West Indies.

M. Lindeniana, Wendl.—New Grenada.

MAURITIA, Linn.

Like the *Manicaria* this genus is represented in English collections by only very small plants of one species, viz., *M. flexuosa*, although six or seven are described, all of them large handsome Palms with columnar and smooth, or slender and armed trunks; leaves fan-shaped, very large, on long slender curved petioles, and in a cluster on the top of the stem. The seeds are oval or globular, varying in size from that of a *Victoria Plum* to that of a *Damson*, and covered with small horny imbricated scales, pointing downwards and shining brown in colour. *M. flexuosa*, Linn., the Ita Palm of Brazil and Guiana, is described as one of the most noble and majestic of the American Palms. Its stem reaches to a height of 80 or 100 feet, and bears a head of spreading fan-shaped leaves divided almost to the base into numerous narrow rigid pinnae, which are drooping at the tips. The diameter of a full grown leaf is 9 or 10 feet, whilst the petiole forms a solid beam 10 feet long, very straight and thick, with a broad clasping base, the whole being quite a load for a man; the spadices also are very large, and when loaded with fruit, are of immense weight. This species grows in moist, very rarely wet ground, chiefly in places where the ground is flooded only in the wet season. Its leaves, fruit, and stem are all of great value to the natives, the leaves being used as a thatch, yielding a strong fibre, and, when young, forming the best Palm Cabbage; from the fruits a favourite beverage is produced, and also from the sap of the trunk, whilst the pith is made into sago. It is placed first among the useful Palms of America, and the name, *Mauritia*, which means "the tree of life," is said to have been given to this Palm in recognition of its great value to man. Small plants of *M. flexuosa* may be seen at Kew, where it is grown over a hot-water tank (temperature, 80°–85°), with the pot partly in the water. A picture of this species is shown in the "North" gallery, No. 119. We have said that *M. flexuosa* is the only species in English collections, but the firm represented by M. Linden have young plants of what they call *M. Carana*, which was named by Wallace, and is figured in his *Palms of the Amazon*, where it is described as a large species allied to *M. flexuosa*, but with leaves less deeply divided, and the sheathing bases of the petioles thickly matted in fibre, as in the *Piassaba*. A small plant of M. Linden's *M. Carana* is in the Kew collection; it is very distinct in a young state from *M. flexuosa*, the petioles being smooth, terete, and

covered with a white powdery bloom, and the blade, which is divided almost to the base into two segments, being pale green above and white below.

MAXIMILIANA, Martius.

The three described species of this genus are among the most magnificent of the South American Palms. Humboldt wrote of *M. regia*, now referred to *M. Martiana*, that "Nature has lavished every beauty of form on it; its smooth trunk, rising to between 64 and 75 feet, its leaves standing almost vertically in the air, their extremities curled like plumes and fluttering lightly and airily round the slowly-balancing midrib of the leaves." When young and stemless this Palm is both stately and graceful, as may be seen in the large examples of it at Kew, where it is planted in a tub and bears twelve leaves, each 25 feet long, with pinnae from apex to base, the lower ones being 4 feet 6 inches long, and as plumose and elegant as *Cocos plumosa*. The *Maximilianas* belong to the same group as *Cocos*, *Attalea*, and *Scheelia*, most of which are characterised by the same gracefulness as the *Maximiliana*. This genus is distinguished by its tall, erect, smooth stems, very large irregularly pinnate leaves (Spruce describes *M. regia* with leaves 34 feet long, each with over 400 pinnae), the pinnae long, narrow, drooping, and arranged in groups of from three to five at intervals along the midrib, from which they stand out in different directions, so as to form an immense plume, like a curled ostrich feather. The bases of the petioles are persistent, often covering the stem quite down to the ground. The spadices are very large, as also are the spathes, which are woody and boat-shaped. Specimens of spadix and spathe may be seen in the Museum at Kew. Seeds as in *Attalea*, but smaller; they are about the size and shape of pigeon's eggs, with a prolonged tip, and are smooth, brown, and pulpy. According to Im Thuro, the Indians of British Guiana live almost entirely on this pulp in times of scarcity. They are also used to breed a kind of maggot of which the Indians are fond. Humboldt compared these fruits with Appricos. Various articles of food, clothing, &c., are obtained from other parts of this Palm, which, next to *Mauritia flexuosa*, is the most useful of all the Palms of Guiana. Seedling leaves large, entire. When very young the *Maximilianas* are not particularly ornamental, and it is not until their leaves are 10 feet or more long that their handsome character is shown. They require stove treatment and plenty of water.

M. caribaea, Grisebarch and Wendland.—West Indies.

M. Martiana, Karsten (*M. regia*, Martius; *Attalea Marapa*, Wendland)—"Marcepa." North Brazil and Guiana. *W. W.*

The Apiary.

MAKING HIVES, &c.

THOUGH most or all of the outdoor work connected with bees is now finished, or, at any rate, ought to be, yet the enthusiastic beekeeper will find plenty of things to do. Everything ought to be put away clean, frames ought to be scraped, as well as sections, and put away in a dry place. If the stocks have been doubled up, as explained previously, the beekeeper may expect early swarms, and will prepare for them. If you have enough hives, or think you have enough, you need only clean them out, and when they are thoroughly dry give them a coat of paint. But if you have not enough hives you had better take time by the forelock and make them at once. This is far better than leaving things till spring, as, in all probability, you will then be so busy that the work would be scamped, while now it can be done easily and carefully. At one time I could make hives well enough, but had to call in the tinman or the carpenter to make the cover; but one lucky day I heard of the Willesden Paper and Canvas Company, and since that time have done everything for myself except the frames.

Willesden paper is waterproof and rot-proof, and is also proof against the ravages of insects, especially ants, and yet it can be cut with a pair of scissors. You cannot possibly have better roofs for hives than this paper. The principal kinds are 1-ply, 2-ply, and 4-ply. The 4-ply is the cheapest and best roof covering; it is so stiff that no boarding is required,

as it can be battened at once. If you believe in small hives the 2-ply would be strong enough; if you like, this paper can even be used for the sides of the hive as well, and I have seen many hives made so. It will also answer admirably for making crates for sections, for dividers, and also for dividers between the frames to keep the honeycomb flat, as recommended by Mr. Simmins, of Hockingdean. Of course in the latter case you would not use any kind of dividers in the brood nest, but only between frames which are intended for the extractor. I have found it an excellent plan to put the frames a little farther apart than the orthodox 1½ inch (from centre to centre) towards winter, and to leave them so till spring. This allows the bees to cluster closer together during the season of repose, and carries out the idea that the best "packing for bees is bees." In spring it is a good thing to bring the frames closer together to keep the brood warm—a most essential thing. Before the end of October cover up the bees with one or two pieces of carpet and see to the roofs. *Walter Chitty, Peasey.*

FORESTRY.

HEDGING.

HEDGING should now be proceeded with, but "ribbing in" and "heading down" had better be deferred a little till the ordinary work is done. Still keep on with cleaning the sides of all live fences before frost and snow put an end to the work. Ground intended for the reception of young Quicks should be trenched over and prepared so that planting may be engaged in during the next two months—bearing in mind that as the Quick is one of our earliest plants to start into growth, early winter planting must be engaged in. In hedging, above all things sharp tools must be used, else a ragged appearance is imparted to the fence. A sharp pruning knife or switcher in the hands of a dexterous workman is as good as anything, but an ordinary labourer who is unacquainted with hedging usually employs a shearing hook tied on an old rake handle and commits havoc that it requires years to repair. It is therefore as well to have on every estate two or three practical hedgers.

FENCING.

Plantation fences, whether of wood or stone, will require occasionally looking to, as farm stock will be apt to attempt to enter the "illicit acre" now that the woodland grass is superior to that in the fields.

The old adage that "A stitch in time saves nine" is most applicable in the case of holes in fences, &c., as the animals, if not stopped soon in their attempts at breaking through, become a source of great trouble.

In repairing stone walls see that "binders"—stones running through from one side to the other—are put in at short distances apart, as a wall without these and formed of small loose stones is but little better than a makeshift. Later on, any gaps in existing hedges may be effectually shut up by inserting good, strong, bushy, and well-rooted Quicks in the openings, the greatest care being exercised to prevent injury to the roots of the adjoining Thorns. Loosen the soil with a pick—not a spade, carefully remove it, plant the Quicks, and substitute fresh soil from a field or the woodland for that taken out. Where the gaps are large we often find it necessary to drive in stakes at about 6 inches apart first of all, and afterwards to plant the Quicks close to these, the stakes acting as a protection to the newly planted Thorns as well as preventing the encroachment of the farm stock.

TRIMMING OVERGROWN EVERGREENS.

Some people prefer the present time to early spring for cutting back and overhauling evergreen banks, &c., and singly planted specimens. In my opinion the choice of time is not of great importance, so, if time and hands can be had, by all means let it be done now. Do not cut-in too severely, for the frost sometimes tells tales on large unhealed wounds, more especially on semi-tender subjects like the *Laurustinus*, Sweet Bay, &c. Laurel banks may, however, be trimmed in as much as is desired, and Yew, &c., will be all the better for another overhaul before the winter sets in. Ornamental nursery hedges might likewise be improved by a second cutting just now.

We always make it a point to trim our nursery, lawn, and village hedges, twice each season—once

early in June, or when the growths have attained full maturity, and again in September or October. Be careful to gather up prunings and have them burnt.

ROADS, WALKS, AND DRIVES.

These should be repaired where necessary, the metalling mentioned in a former article being used for the walks. Pick over, not too deeply, the parts of the roads on which the stones are to be placed, as this will cause them to set quickly and well. A coating of gravel, or screenings from a stone-crusher is a great help to consolidating and levelling newly repaired or newly constructed roads, and a still further help is to run a heavy roller over the surface after a night of rain. Bye-paths through the woods must be examined and repaired. *A. D. Webster, Penrhyn Castle, North Wales.*

THE FIELD MUSHROOM :

AGARICUS CAMPESTRIS.

THE field Mushroom is now common in pastures and plains, and on hill and roadsides where the grass is kept short by the grazing of sheep and horses, and where grass may be said to be growing with some little difficulty. The field Mushroom does not grow in meadows or in any position where grass is preserved, or where it grows luxuriantly. During each autumn correspondents of the *Gardeners' Chronicle*

(see D in section, fig. 99). The structural characters belonging to a Mushroom are best seen when an example is cut in two from top to bottom, as shown in fig. 99. The first point to be observed is the gills; these never really reach the stem, but remain free from it, as at A, A. It should be noted that the frill belonging to the stem reaches to the base, as at B, in young examples, and that it at first entirely hides the gills (see C, D, as shown in the smaller section). It then breaks apart, as shown at C, D, in the larger section, which represents a mature example. The frill or veil is continuous over the top of the Mushroom, as at E, E, and it is this veil which is peeled off before cooking is commenced. The possibility of peeling the top of a Mushroom is one test of its genuineness. The purple-black spores which answer the purpose of seeds are very minute, and if enlarged 500 diameters are seen as at F.

It is possible that the Horse Mushroom and field Mushroom may be one and the same plant under different conditions of growth, for one species gradually blends into the other. Both have many varieties. One certain fact is that the bedding Mushroom, raised from Mushroom spawn, is not the true *Agaricus campestris*, but a variety sometimes named *A. hortensis* or other names. The bedding variety may be a distinct form of *A. campestris* or of *A. arvensis*. From what one sees of the habit of true *A. campestris* it does not seem to be a species likely to revel on a bed of dung and earth; the Horse Mushroom, on the

FIG. 99.—SECTION OF *AGARICUS CAMPESTRIS*.

are constantly sending doubtful examples of Mushrooms for an opinion as to their genuineness or badness. In the majority of instances the specimens sent are true Mushrooms, but in some cases other fungi are sent, sometimes very different from the genuine Mushroom. At times the examples are from Mushroom beds, in other instances from fields. One cause for doubt originates with the Mushroom itself, for it is an extremely variable plant, differing in its various forms immensely both in colour, size, and taste. It however alters very little in structure, or, if the expression may be allowed, in design. The general design is well fixed, the variation rests in the proportions of the parts and their tints. Like all other esculents, Mushrooms vary in quality. As a rule Mushrooms are small and elegant plants, not larger, but often smaller, than the group shown in the illustration. Very large or gigantic field Mushrooms are almost or quite unknown; the gigantic Mushrooms sometimes described in newspapers belong to the coarse and inferior Horse Mushroom, *Agaricus arvensis*. The nature of the frill which encircles the stem of a true Mushroom is shown in the illustration (fig. 99), and the gills are at first white, then pale rose-salmon, and at length purple-black. The gills of the Horse Mushroom change to a pallid clay colour, and then become black. The change of colour is caused by the gradual, and at length profuse, growth of the spores, which at length cover the surfaces of the gills. It is the spores that really change colour, not the gills themselves. The frill which encircles the stem reaches to the edge of the cap, where traces of it may be seen hanging below the general level of the gills

contrary, commonly grows in close juxtaposition with dung. If it can be proved that the spores of the true Mushroom will really grow in dung, it must be conceded that in so growing the resulting species becomes the Horse Mushroom, or, in other words, the two species are identical, but possess slightly different characters on different habitats. With the difference of habit a great change may be observed in the taste, for the tastes of a bed Mushroom and field Mushroom are hardly comparable, the latter being beyond measure the better, more tender, more delicious and juicy of the two. The Mushroom bed is a fertile breeder of parasites and Mushroom diseases: it often swarms with microscopic thread-worms (Nematodes): these minute worms enter the Mushroom at the base of the stem, and soon infest every part of the fungus; they are, of course, invisible to the unaided eyes, but only too familiar to persons who are frequently looking at Mushrooms in health and disease, and in all stages of growth, with the aid of the microscope. A diseased Mushroom is always unwholesome (like a diseased oyster or crab), and it may prove poisonous.

It would seem desirable to attempt the artificial cultivation of some of the more fleshy and delicious varieties of *Agaricus campestris*, but if grown on the usual Mushroom bed they would probably degenerate into the inferior and coarse bed Mushroom. It would probably be difficult to artificially imitate the habitats of some varieties—the sweet pure breezy air of hills and commons is so different from the confined air, laden with vapours from dung, such as one meets with in Mushroom sheds. In the Rev. John Stevenson's excellent new work on British fungi, he says the

Mushroom grows "in meadows, &c." I have never seen one in a meadow, but always in short pastures, and on plains and hills and roadsides, where the grass is constantly nibbled short by grazing animals. Several varieties of the Mushroom and several allied species turn rufescent or even blood-red when cut or broken. The change of colour generally causes surprise, and sometimes suspicion; but the variety of the true Mushroom which turns crimson, sometimes pale, sometimes dark, is probably superior to the type in taste. The Horse Mushroom and its varieties commonly change to yellow or yellowish-brown when cut or broken; so does the bed Mushroom.

AUTUMN TINTS.

In modern landscape gardening too little attention is paid to the value of deciduous trees in producing effect. In recent years great importance has been attached to the planting of evergreen trees, chiefly Conifers, a class, without doubt productive of excellent results when judiciously arranged, and planted at proper distances so as to ensure their perfect and natural development. But they should not be allowed to monopolise the parks and pleasure grounds of an estate to the exclusion of native and exotic deciduous trees that play their part so conspicuously

night, although it takes some considerable time to regain its wonted green colour on the return of spring and a milder temperature. *Thuia gigantea*, *Retinospora squarrosa*, and *Cryptomeria elegans*, may also be cited as familiar and well-known instances amongst Conifers, that assume a characteristic brown hue in winter.

The cold and chilly nights of the latter end of September and October seem to have the effect of hastening the brilliant coloration, so strikingly characteristic of the decaying foliage of *Liquidambar styraciflua*. Trees in open, exposed places assume tints of great richness, while those that are sheltered by other and taller trees retain their summer coloration of the foliage much later into the autumn, and if frost suddenly sets in they may drop while comparatively green. The numerous shades of colour on the same tree are also noteworthy. The upper surface of a leaf may be of the deepest blood-red, while the under-surface is green; and this precedes another stage, where the upper surface is of the liveliest and warmest crimson, almost scarlet, with the under-surface yellow, and uniformly diffused, or more or less broken into zones or blotches. What applies to this tree with regard to exposure applies in a similar manner to *Parrotia persica*, by some authorities considered as genealogically allied, and these again with the Plane. The decaying foliage of the latter is characterised by more sober tints of pale brown and yellow. Grown as a tree in the open, the *Parrotia* is all aglow with yellow and crimson or red by the end of September, exhibiting a more universal coloration and shedding its leaves earlier than plants grown against a wall.

The red American Oaks form quite a series of trees assuming in several instances tints as rich and varied as the *Liquidambar*, but which unfortunately have been greatly neglected in landscape gardening since the days of Loudon who used so frequently to refer to the rich collections at Chiswick, Syoo, and Hackney, part of the first-named collection being still preserved at Devonhurst. The huge lobed leaves of *Quercus coccinea* die off of a dull purplish-red, finally becoming yellow and pale brown before dropping. Those of *Q. coccinea* and *Q. palustris* are handsomely cut and lacinated, and on the approach of cold weather assume unmistakable tints of red deepening to scarlet. Another tree worthy of special mention is *Q. tinctoria*, with broader and more massive leaves, the uppermost and youngest of which are the first to colour, forming crimson and green rosettes where the shoots have been late in maturing or have formed a second growth. It is sometimes known as *Q. quercitron*, and specimens under both names may be seen in the extensive collection at Kew. *Q. ambigua*, with deeply lobed leaves, and *Q. imbricaria*, with oblong entire leaves, also assume handsome crimson or red colours early in the season.

Trees of more sober hues, including our native ones, play an important part in landscape scenery; and the serene and yellow leaf of *Tilia vulgaris* serves to deepen by contrast the verdant tint of those that ripen later, or such as *Populus nigra*, *P. balsamifera*, *Acer pseudo-Platanus*, and the sombre hue of Conifers generally. The *Tilia* in question is but too frequently planted in the streets of London, where the dryness of the climate hastens the fall of the leaf early in September in dry, hot seasons, and where the murderous hacking to which it is frequently subjected to keep it in bounds renders the tree a hideous object of pity. *T. petiolaris*, a handsomely drooping tree, from the Crimea, with long slender petioles, and foliage white beneath, is even more attractive in autumn when thickly interspersed with leaves of a clear rich canary-yellow. Those of the Beech become first yellow and then of a rich shining brown previously to their final dull brown stage. Who has not observed the young unfolding leaves of *Populus nigra*, a mixture of red and yellow, after most trees have been in leaf for some time, changing to a deep shining green, and ultimately changing to pale yellow before they fall? The clear pale yellow of *Acer platanoides*, and the brown, heavily blotched, mature and falling leaves of *Acer pseudo-Platanus* are familiar objects in hedges, woodland, and avenue scenery. The red and bronzy leaves of *Vitis tricuspidata* (Veitchi), especially in the upper reaches of tall climbing plants, and the glowing crimson and flame colour of different individuals of *V. hederacea*, together with hosts of other subjects, must not be forgotten in an enumeration of autumn tints. J. F.

FIG. 100.—*AGARICUS CAMPESTRIS*: THE FIELD MUSHROOM.

There are six or more species of British fungi all closely allied to the true Mushroom, and all edible. Some of these species have many very distinct varieties. Varieties and species alike have a strong tendency to blend with each other in various ways. The structure of all, however, is permanent, and agrees with the outline sections given with this description. *Worthington G. Smith, Dunstable.*

HENNA, the pulverised leaves of *Lawsonia alba*, is an article of export from Persia to all Mohammedan countries. The best comes from Chahir, east of Kerman, and it contains about five or six times more dye-stuff than any other. It costs on the spot about 9s. per pound, English, and second quality about 7s.

with every changing season. Compare the sober tints of spring, the deeper shades of summer, and the fading glories in yellow, brown, crimson and ochreate hues of deciduous trees in autumn with the perennial green in one or other shade of most Conifers, and it will be seen by any unprejudiced eye that the former appeal with no uncertain though silent call for our recognition. The form is endless and the habit varied, but the changing hues of autumn form a study in themselves that defy the brush of the most skillful artist. Individuals are extremely dissimilar in the time of shedding and depth of colouring of the foliage, due partly to soil, situation, exposure, and other conditions. Climatic influence is a powerful agent in modifying the time and depth of coloration. In evidence of this witness the crimson and glowing red of *Berberis aquifolium* it may be after a single frosty

NOTES FROM ASHTON COURT.

In the new winter garden here the plants have made good growth. The rockwork with which the walls are faced and the margin of the irregular crescent-shaped pool is now well clothed; the Ferns, *Lycopodiums*, *Begonias*, and other things planted out have progressed apace, so that the whole has a fully furnished appearance. The tufa and water-worn stone from the Cheddar Valley used is congenial to the growth of the native mosses, that have been freely employed—the mellow colours of which adds much to the general effect. In choosing the plants for planting care was taken to confine the selection to such kinds as would maintain an even growth, so that the too common result in such arrangements, of a few over-vigorous growers smothering the rest, has been avoided. Of Ferns, *Adiantums*, *Davallias*, *Pteris caerulea*, and others of like habit, have been used as a setting for *Nephrolepis exaltata* and other elegant habited sorts, intermixed with silvery-leaved *Begonias*, *Aspiditras*, &c. *Richardia setipecta* is at home round the edge of the pool, where, either in or out of flower, it looks well. The caps of the columns that support the arches on which rest the walls have been hollowed out so as to hold enough soil to grow such things as the variegated *Tradescantias* and other trailing habited subjects. Hanging baskets are filled with *Lycopodiums*, *Adiantums*, and *Nephrolepis* of various kinds, Ivy-leaved *Pelargoniums*, and *Ficus repens*, with a few plants of blue *Lobelia* here and there to give a bit of colour. In one of the recesses where there is comparatively little light the wall is clothed with a plant of one of the ordinary fruiting Figs that does well in the situation. The roof is getting nicely draped with such things as *Acacia Ricciana*, *Passifloras*, *Asparagus plumosus*, the green and the variegated varieties of *Cobaea scandens*, the two latter kept thin, so as not to darken the plants below too much. Right and left of the aviary, which occupies a central position at one side of the house, there is a handsome pair of *Araucaria excelsa*, about 15 feet high, in pots; they just suit the position, associating well with the other large plants employed. Spare elegant habited Palms, such as *Cocos Weddelliana*, with *Cycas revoluta* and *Dasyliroa acrotichum* occupy prominent positions. Amongst the larger growing plants the somewhat scarce variegated leaved *Camellia*, *C. japonica variegata*, is represented by a fine pyramid-shaped specimen some 7 feet high. Flowering plants of such things as happen to be in season, to give the requisite amount of colour, are introduced amongst the fine-leaved kinds, which latter necessarily, in a structure of this character, play the most important part.

The conservatory was gay with the usual summer flowering subjects associated with the permanent occupants of the house. A pretty effect in combination of colour was here secured by running the shoots of one of the crimson-flowered *Tasconias* amongst those of the variegated *Cobaea scandens*, the creamy-coloured foliage of which set off the brilliant flowers of the *Tasconia*.

Bouvardias and perpetual flowering *Carnations* may be said to be indispensable where a supply of sweet-scented flowers is required through the winter. Mr. Bethell, who is very successful with these favourite flowers, turns the plants out in pits in the spring; the beds are well raised, so as to keep their heads up to the glass. Good, well-established stock are used and encouraged to make as much growth as possible during the summer; the plants remain here to bloom, heat being turned on, and regulated as required. So treated an amount of bloom is secured such as pot-grown plants will not produce.

FRUIT.

Peaches and Nectarines in the early house were a grand crop, both as regards the size and quantity of the fruit. The second house was of a similar character. In one of the lean-to houses in the Peach range occupied by Black Hamburgh Vines, there was a fine crop just ripe, full-sized bunches, beautifully coloured. In the Muscat-house, and also in the house containing late black kinds—Black Alicate, Lady Downe's, and Alwick Seedling—good crops were approaching maturity; of the last named shy setting variety there were some handsome bunches. Here, as in not a few places, Pines have been given up, and Melons have taken their place. Of these there are large

quantities grown, so as to keep up a supply from as early in the season as they can be had, up to the end of summer. There was a fine lot of ripe fruit, whilst the plants to come on were promising.

FLOWER GARDEN.

Here, as in most places this season, hedging plants after being put out were so chilled by the continued cold weather that they made little or no progress at first, but the lost time has been recovered so that the flower garden was fully furnished later on. The style of planting adopted by Mr. Bethell is such as calculated to avoid the stereotyped sameness which is one of the worst features of modern flower gardening. Most of the beds are filled with a combination of various kinds of plants differing in habit and in the colour of their flowers, avoiding so far as possible violent contrasts. Enough of the higher colours have been introduced to give the requisite warmth to the floral picture, yet subdued shades predominate in the beds that are occupied by the ordinary flowering plants, as in the carpet arrangements. The effect produced by combinations such as purple *Verbena* and the old *Maagles'* variegated *Pelargonium*, as seen here are not easily heated. T. B.

Florists' Flowers.

WINTER FLOWERING CARNATIONS AND PICOTEEES.

At the end of last year some doubt was expressed, in the columns of the *Gardeners' Chronicle*, as to perpetual or Tree Carnations blooming in the autumn months, and through December, January, and February. Mr. Turner asserts that a large number of the named varieties in his collection will do this; and it is also stated that the varieties that are winter-bloomers are very few indeed. I think any one visiting the Royal Nursery, Slough, during November and December, will see a house of winter-flowering Carnations yielding bloom. Be this as it may; Mr. Harry Turner appears to have hit upon an admirable plan for securing a good bloom of these Carnations during the dull season of the year. In January last some seed of winter-flowering Carnation was sown, and the pans placed in a warm greenhouse, with the result that the seeds germinated quickly; the young plants were grown on, and planted out in prepared beds in the open ground in March. Three beds were planted out, about 700 plants being placed in each. The plants are now either in bloom, or very near flowering, and it is worthy of note that the cases of plants not flowering are very few and far between. Mr. Turner states the plants will be lifted, placed in pots, and arranged in a house that can be heated when it is necessary to keep out frost and dry up damp. That these plants will bloom—and bloom abundantly, too—all through the autumn and winter, there can be no doubt. They have all the vigour characteristic of seedlings; they will be lifted with good balls of soil adhering to the roots, and be put into pots only just large enough to take them. Here, then, we seem to have a happy method by which a head of bloom on winter-flowering Carnations can be secured just when it is most needed. That these plants will mature their blooms there can be no doubt; but they will have the advantage of being in a house by themselves, where they can have the treatment they require. Probably the difficulty that some experience in blooming these Tree Carnations in mid-winter is because they have to grow them in a house with other plants in an atmosphere too close for them.

I could not help being struck with the fine quality shown by these seedlings. If seed can be obtained that will produce flowers of such quality as those seen in the seed-beds at Slough, then the distinguishing of many particularly good varieties by naming them will be rendered unnecessary, as it is in the case of *Calceolarias*, *Cinerarias*, &c. There were fifty flowers that appeared to be worthy of names; but, as Mr. Turner observed, if he commenced naming, his difficulty would be where to stop.

By the side of these beds was another raised from seeds sown in the ordinary way in March. These were much later, but the seedlings had made good plants, and Mr. Turner stated that he should lift these also, pot them, place them in a cold frame for a time, and he anticipated they would all, or nearly all,

flower in early spring. If this be so then we are not far off from the time when we may expect to have Carnations and Picotees in bloom all the year round, for Mr. Turner has demonstrated that by means of seed sown in heat in January Tree Carnations can be had in flower very soon after the ordinary summer varieties have done blooming, and those that will bloom in spring will carry on the floral succession until the summer flowering bizarres, flakes, selfs, and fancies, and all the sections of Picotees, together with the many border sorts, will be making June, July, and August glorious with their fine scented blossoms. It will thus rival, even if it does not excel, the Chrysanthemum in its perennial duration of flower. R. D.

CARNATIONS AND PICOTEEES.

Mr. E. S. Dodwell recently stated, in a communication to a friend who sought his direction as to the best date for potting up the layers for the winter: "If I could have 4000 potted up in one day, I should choose October 20 for the operation, but that not being possible, we work from the beginning to the end of the month, or even into the first ten days of November." Happily, this is work that can be done under cover; and if wet weather has set in, some of the pots or layers should be got under cover a day or two previous at least, so that the rain can drain from these. Mr. Dodwell regards premature potting as a "grievous evil," and he remarks "all that is required is that the plants shall freely feel the sides of the pots with their roots, so as to ensure perfect drainage and sweetened soil before going off for their winter's sleep; but on no account should they become pot-bound, or the very worst evil may be expected to result;" and it may be of interest for some if I quote a little further: "The soil required is a good sweet sandy loam, with the addition of a fifth or sixth part of sweet leaf-mould, and such well-washed sand or powdered crocks as may be needed to ensure a free percolation of air and water. Various sized pots should be used, according to the strength of the plants. Over-potting is a great evil. When potted, place in a cold frame and keep close for some days, shading from the bright sun. Water sparingly." R. D.

TREES AND SHRUBS.

GLEDITSCHIA.

INDEPENDENTLY of the beauty of the trees belonging to this genus, they are singular and interesting in many respects on account of their habit of producing spines on the lower part of young trees and also on the trunks of older ones, while the leaves are not only pinnate and bipinnate on the same tree, but on the same branch, and this character even is displayed very frequently on one and the same leaf. In the economy of the plant this varied character of the leaves is, no doubt, a facile and ready method of adaptation to conditions and surroundings. On slow growing specimens and on the basal parts of branches where the internodes are short, and again on old trees making but little growth, the most predominant leaf is the simply pinnate form; but on vigorous growing young trees and on the upper part of vigorous branches the bipinnate leaf is the prevailing form, and gives the tree an uncommonly handsome appearance. Excepting in a few favoured old plants, comparatively seldom do we find the *Gleditschia* enjoying that prominence in a landscape to which its uncommon and graceful character entitles it. At Devonhurst, the grounds of which formerly constituted the pleasure-grounds of the Royal Horticultural Society, are three trees, forming part of the once rich collection which happily yet exists in a goodly number of fine old specimens. The bulk of these are Oaks, Elms, Maples, and Limes, rather thickly planted in places, but still enjoying robust and vigorous health. The tallest of the three *Gleditschias* is the Honey Locust, *G. triacanthos*, a most variable tree, and with difficulty recognisable under different conditions. This generally applies to young as contrasted with old trees, the former of which often assume a very leafy state, with numerous bipinnate leaves and small leaflets. This character disappears more or less in old specimens, and then they have the addition of their singular scimitar-shaped, pendulous, flat, reddish-brown pods, as in the present instance. The other two specimens under notice are *G. sinensis*, inferior in height to *G. triacanthos*, especially the smaller, more

typical, and shiny one, which forms a spreading head, and does not exceed 25 feet in height. This latter is bearing numerous pendent pods—in this instance green; and, owing to the spiny character of the otherwise naked trunk, it is the most interesting of the group. Fresh branching spines, which are in reality aborted branches, continue to be given out annually, and, being green, make a conspicuous contrast with the formidable looking brown and dead ones. The leaves are equally variable as are those of *G. triacanthos*, and the leaflets much broader, ovate-elliptical, obtuse. The third tree, which is intermediate in height between the other two, would seem to be a semi-spinelous variety of *G. sinensis*, although Loudon states it to be dwarfier than the type. The five or six species composing the genus are extremely difficult to discriminate on account of their variability. *7. F.*

FITZROYA PATAGONICA.

We have a good specimen of this growing in the pinetum here; it is from 20 to 25 feet high, and is well furnished with its dense scaly growth; it stands in a position very much protected from all the cold winds and frosts. It is of very slow growth, but is deserving of a place amongst a collection of Conifers, it being very distinct from any other species.

SQUOIA SEMPERVIRENS.

There is a specimen of this growing in the pleasure-grounds here; it has probably been planted from thirty to thirty-five years, which is from 60 to 70 feet high, and girths 8 feet at 5 feet from the ground, is well branched from top to bottom, and is a handsome object as seen from the carriage-drive. *Edward Ward, Hoveall Gardens, Bromsgrove.*

CEDARS AT BEECHWOOD PARK, HERTS.

Noting the measurements of Cedars at Bretby Park and Bayfordbury, it may be interesting to some to know we are here somewhat famous for Cedars. There are eight fine trees growing near the mansion, the girths at 5 feet of which are as follows:—No. 1, 15 feet 2, 15 feet 9 inches; 3, 17 feet 6 inches; 4, 18 feet 6 inches; 5, 19 feet; 6, 20 feet; 7, 21 feet; 8, 26 feet. The tallest of them are about 100 feet high. No. 8 is a grand old tree. I hope to be able to get a photograph of it after the fall of the leaf, as it is surrounded by other trees. Some of the trees have suffered from wind and heavy falls of snow, but those that have escaped with but little injury are still handsome trees. I do not know if it is common for these trees to ripen seed in this country. I have two seedlings I raised about fifteen years ago: the tallest is now 15 feet high. [Seedling plants of all ages come up all over the grounds at Bayfordbury. ED.] *7. Freeman, Beechwood, Oct. 11.*

The Flower Garden.

BULBS, TUBERS, &c.

In planting Scillas, Grape Hyacinths, winter Aconites, and hosts of other hardy bulbs are often planted without effect, from being put too wide apart. If planted in lines, two or three lines should be planted side by side; if in clumps, three to four or five dozen should be planted in a circle about 1½ to 3 inches apart, according to the spread of the foliage. Where soil and situation are light and dry Ranunculus and Anemones may now be planted, but in cold heavy soils this had better be deferred till February; but if the situation be well adapted for autumn planting the plants will be much stronger, and will flower more satisfactorily than spring planted ones.

Jonquils never flower well the first year after planting. It is better to let them remain undisturbed for three or four years. Irises should now be planted; the sooner this is done the stronger will they flower; those which have been planted for two or three years should not be disturbed. A good top-dressing will be all that is necessary for the latter.

Narcissus should not be disturbed unless they have become densely matted together; once in five years will be often enough to separate them. The sooner the operation the better, as they will soon begin to emit fresh roots. A liberal addition of well-rotted cow-dung and fresh soil should be given to the beds previous to replanting.

Lilliums should be planted as soon as received; if allowed to become flaccid through light and drought they sustain serious injury. *L. auratum*, and many others of the better sorts, succeed admirably planted in Rhododendron and other peat beds; they should, however, receive slight protection with dry leaves in severe weather.

Auriculas should now be housed for the winter. Carefully examine the drainage of each pot to see all is right; remove moss and other weeds from the soil, carefully guard against a stagnant state of the atmosphere, and do not over-water them.

The same applies to other alpine plants in pots. The sashes should be placed over them during fogs and rains. *Wm. M. Bailie, Luton Hoop Gardens.*

PLANTS AND THEIR CULTURE.

THE STOVE.

WHERE room is limited much may be done to increase it by taking from their trellises such things as Allamandas, Clerodendrons, Combretums, Dipladenias, &c., and tying them to stakes in an upright position; this will give growing plants more room, and will not hinder the ripening of the wood of those thus treated. Any plants of *Ixoras* that have grown to a considerable height should be pruned back, cutting well into the old wood, and if mealy-bug or scale be present the plants must be washed with an insecticide in the proportion of 6 or 8 oz. to the gallon of water, and this operation must be repeated several times at intervals of three or four days, but not carried over a period of a fortnight, as the plants will break in about that time, and the young growth would be injured. Now is the best time in the year to eradicate insects in the stove, and any plants infested ought to be thoroughly washed with a strong solution, repeating it until the pests are quite destroyed. Any plants about which there is any doubt as to their being thoroughly cleaned in this way should be cut back, as it is better to sacrifice a little of the flower the next season, than that insects should get the upper hand and be a source of annoyance the whole year. Where many subjects are infested, remove all plunging material, old plaster, &c.; have the walls whitewashed twice, stopping up every crevice, painting all woodwork, so that everything be quite clean. Be careful when bringing in young plants not to put them in contact with the older denizens until you are satisfied the latter are quite clean. Late Allamandas should be kept well up to the glass, as the blooms they put forth will be very useful during the next three weeks. Another useful plant is the old *Ixora coccinea*, whose large trusses of an uncommon colour are much appreciated. This department should now be quite gay with *Tydeus*; the varieties that I grow for late work are *aurantiaca*, *zebrina*, *Maflame Heine*, *Madame Halphen*, *tricolor*, *M. Lavelle*, and *Robert le Diable*; these arranged with early *Gardenias*, *Eucharis*, *Paneratums*, *Gesneras*, plants with fine foliage, and an edging round the stages of *Panicum*, *Torenia*, *Smilax*, or *Cyrtodora fulgida*, are very pleasing. Late *Caladiums*, *Gloxinias*, and *Achimenes*, whose leaves begin to turn yellow, should be placed in a warm corner and watered more sparingly, but avoid the error of drying off too quickly, otherwise their corolla and tubers will be shrivelled. The same rule applies to *Gloriosas*, *Bilbergias*; these latter beautiful plants will soon be showing their blooms, and care should be exercised in the use of the syringe so as not to fill their crowns with water or the flower spike will rot and if by chance this should happen they must be turned upside down to drain. *A. Evans, Lythe Hill, Haslemere.*

THE BULB GARDEN.

AUTUMN AND WINTER CROCUSES AS DECORATIVE PLANTS.

I CAN fully endorse all that Mr. Douglas says in favour of autumn-flowering Crocuses, as they now form one of the most decorative features in my garden here, and it is surprising that the old and well-known species, such as *speciosus* and *nudiflorus*, which respectively multiply so rapidly from bulbils and stolons, are not more widely cultivated. By far the greater number of known species have been introduced within the last ten years, and as yet there has scarcely been time for extensive multiplication and distribution. My object in writing is to point out how easily all the species of Crocus can be multiplied from seed, and how soon the little-known species ought to be within the reach of horticulturists as common decorative plants. The seed should be gathered as soon

as the capsule commences to open, and at once sown in the open border.

Such of the autumn-flowering species as produce leaves at the flowering-time will vegetate in the autumn, and the remaining species in the spring, but many of the seeds may remain dormant for a year or two, and then vegetate. The seedling corms of the first year are so small that they cannot be easily handled, and looking at the fact that dormant seeds will vegetate in the second year, I think it best to leave the seed-bed undisturbed for two or three years. A few flowers may be produced the second year after sowing, and in the third year the plant has reached its maturity and flowers freely. The seed patch should then be taken up and replanted.

Of the autumnal species suitable for the open border the following may be enumerated for successional flowering:—

- C. Scharojani.—Orange; early in August.
- C. vallicola.—Straw-coloured; August and September.
- C. zonitius.—Vinous-lilac; August and September.
- C. nudiflorus.—Blue; September and October.
- C. pulchellus.—Bluish-lilac; September and October.
- C. speciosus.—Blue; September and October.
- C. triflorus (Purpure-minus).—Blue; October.
- C. medius.—Purple; October.
- C. astrictus.—Byzantine, lilac, or white; October.
- C. cancellatus.—White, blue, or striped; October.

Of the numerous varieties of *C. sativus*, Cartwrightianus, from the Greek Archipelago, is the most ornamental, and floriferous, and in fine October weather will produce an abundant display of its beautiful vinous-purple or pure white flowers. In a fine autumn *C. Boryi*, white; *C. Tournefortii*, lilac; and *C. levisgatus*, feathered purple, will all flower out-of-doors, but cannot be relied upon with the same certainty as the earlier autumnal species.

Ten years ago there were barely twenty species of Crocus in cultivation, now we possess almost the entire genus, and I have in my garden fifty-eight out of a genus of sixty-nine species. Their multiplication is only a question of time, and I hope in a year or two to assist in their distribution; but at present, in reply to numerous correspondents and applicants, I regret that I am not in a position to further diminish my stock. *George Mason, F.L.S., Benthall, Kenley, Surrey, October 6.*

FRUITS UNDER GLASS.

VINES.

LATE varieties should have all the sub-laterals removed forthwith, together with the tops of any unduly long main laterals, so as to allow of more light reaching the bunches as well as the wood. The plumpest bud on the lateral that is nearest to the main stem should be selected for producing fruit next year, cutting out all the other buds carefully so as not to injure the leaf at the base.

MELONS.

To ripen Melons satisfactorily in October and November suitable pits or houses should be provided, and these should have a good supply of top and bottom-heat (hot-water pipes) at command with which to maintain a night temperature of from 65° to 70° (according as the weather is cold or mild) and 70° to 75° by day, running it up 10° with sun-heat, having a little air on at the same time. To attempt to grow Melons in the absence of proper accommodation during the late autumn months must end in failure, inasmuch as fruits grown under less favourable conditions must necessarily be deficient in size, colour, and flavour. To attain these points the temperature maintained in the houses during the ripening period of the fruits should be somewhat high, and dry and airy. Therefore the frames of frames in which Melons are grown being made up after the end of September, with a view to ripen or hasten the maturation of the fruit, is not only labour misapplied, but it is also calculated to thwart the quicker ripening and flavouring of the fruit, inasmuch as the steam which arises in the frames and settles upon the fruits is accompanied by a humid and stagnant atmosphere, and renders the flavour of the fruits thus grown little better than that of a Turnip.

Atmospheric moisture should after this date be distributed very sparingly in houses in which the plants are swelling their fruits, supplying only sufficient to promote gentle growth, using the syringe freely in the morning and afternoon of bright sunny days, at other times and states of the weather not at all; and as soon as the fruits approach maturity moisture, other than that arising from application of water at the roots, when necessary, and which should then be given in the morning, should not be distributed in the house. This remark applies especially to the houses in which fruit of such thin-skinned varieties as *Hero* of Lockinge are now ripening. *H. W. Ward, Longford Castle.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Oct. 18	Sale of Dutch Bulbs at Frotheroe & Morris' Rooms. Sale of Dutch Bulbs and Plants from Ghent, at Stevens' Rooms. Sale of Nursery Stock, at Kilburn, by Frotheroe & Morris.
TUESDAY,	Oct. 19	Clearance Sale of Nursery Stock, at the Avenue Nurseries, Cambridge, by Frotheroe & Morris (three days). Sale of Greenhouse Plants, Bulbs, &c., at Frotheroe & Morris' Rooms.
WEDNESDAY,	Oct. 20	Sale of Nursery Stock and Greenhouse Plants, at the Longborough Nursery, Brixton, by Frotheroe & Morris. Sale of Dutch Bulbs and Plants from Ghent, at Stevens' Rooms. Apple and Pear Show at Exeter (two days).
THURSDAY,	Oct. 21	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Sale of Established and Imported Orchids, at Stevens' Rooms. Sale of Imported Orchids, at Frotheroe & Morris' Rooms.
FRIDAY,	Oct. 22	Clearance Sale of Nursery Stock, at The Nurseries, Lewisham, by Frotheroe & Morris. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
SATURDAY,	Oct. 23	Sale of Dutch Bulbs and Plants from Ghent, at Stevens' Rooms.

IF there be any truth in popular opinion, the present autumn should be singularly favourable for RIPENING THE WOOD. No doubt in this case, as in many others, popular opinion is substantially correct. It is when we come to deal with explanations, and when we draw inferences from these so-called explanations, that error creeps in. A popular expression like this of "ripening the wood" requires overhauling now and then, in order to ascertain to what extent and in what manner it is representative of the truth. No doubt the expression was adopted by reason of the close analogy that exists between the ripening of the fruit and the maturation of the wood. That the two processes are similar is unquestionable, but that they are identical in their nature can hardly be true, seeing that permanence or continuity is aimed at in the one case, while the fruit is in general only a temporary device for securing the dispersion of the seed. Where it serves also as a protection, as in the case of the shell of a Coconut, the analogy between the two processes of ripening—that of the fruit and that of the wood—is of course closer. Close also is the analogy between the ripening of the wood and that of the seed.

Ripening of the wood involves two distinct things, one consolidation of structure, the other storage of nutritive matter. If consolidation were the only result it might be advantageous from the timber merchant's point of view, but it would be of much less moment from the standpoint of the fruit grower or of him who looks for the development of flower-buds in autumn. Consolidation is brought about by the deposit of woody matter in the cells. Of the two it is rather a sign of death than of life. Storage takes place principally in the cells of the bark which have a more active vitality than those of the wood, both actually and potentially. The storage that takes place is of starch, of fatty materials, of Grape-sugar, or other substances capable of supplying food either directly or more frequently indirectly for the use of the young bud when stimulated into renewed growth by the increasing heat of spring. But the food material has not only to be stored, it has to be made first, and this manufacture goes on all through the summer, being dependent on adequate supplies and appropriate combinations of light, heat, and moisture.

Ripening, then, in so far, is no new process specially peculiar to autumn. It has been going on to a certain extent during the summer in association with the growth or actual formation of new cells. This latter process during the autumn months receives a check from the diminished temperature and the lessened absorption and circulation of water; less food-matter is in consequence used up, and a proportionately larger amount stored for future use, while in all probability the chemical changes in the stored up matter are also proportionately

more active than before. Ripening of the wood, then, in a general sense, implies consolidation or hardening of tissue, drying up by diminished absorption of water, storage of and change in the nature of the food material. If these go on well and uninterruptedly the plant goes to rest as the temperature falls, such rest, however, not by any means being absolute inaction. But if after this natural process of ripening the temperature does not fall sufficiently, while the rainfall becomes excessive, growth continues or recommences, to the detriment of the tree when, later on, frost occurs. The wonder is that this second growth in late autumn does not happen oftener than it does, especially when it is borne in mind that growth in spring often recommences at a period when the conditions, so far as temperature is concerned, would seem less favourable than they are in autumn. All this seems to imply that the so-called rest of plants, the importance of which cultivators insist upon, is really a period of chemical action and change in the stored material, and that growth is not favoured until that action is advanced towards completion. How much growth has been prolonged and maturation deferred this autumn was apparent at the great Fruit Show held this week at Kensington, when, although the Apples were large and of good quality, they were deficient in colour as compared with their tint in an earlier season.

— PROFESSOR PVNAERT.—We understand that the *fitte* in honour of M. PVNAERT, on the occasion of his entering upon the twenty-sixth year of his professorate at the Ghent School of Horticulture, will be held at the Casino, Ghent, at 4 P.M. on October 24, when a splendid work of art in bronze, together with an album of portraits of his friends, will be presented to him "avec grande solennité".

— THE PRIMULA CONFERENCE.—The report of this meeting, with the full text of the papers read and the discussion which took place, is now completed, and will, we believe, shortly be published in a number of the *Journal of the Royal Horticultural Society*. Appended to the report are full lists of the cultivated species of Primula, as well as of those not yet introduced into cultivation, and numerous documents likely to interest growers of these plants. Mr. RIDLEY'S paper on "Orchid Nomenclature" at the provincial show of the Royal Horticultural Society at Liverpool will also be published in the same number, together with a summary of the discussion that took place on that occasion.

— BRITISH FUNGI.—The second volume of the Rev. JOHN STEVENSON'S *Enumeration of the British Hymenomyces* has just been published by Messrs. BLACKWOOD & SONS. It contains the systematic description of numerous genera and species of Hymenomyces fungi, with very neat illustrations by Mr. WORTHINGTON SMITH. A very useful feature consists in the explanation of the names. If in a future edition the accented syllables could be marked as a guide to pronunciation, the advantage would be enhanced. Another most desirable innovation for those who have to refer to foreign books, is the adoption of the metrical system for measurement, while to meet other requirements ordinary English measurements are also added.

— "BOTANICAL MAGAZINE."—The plants figured in the October number of the *Botanical Magazine* are the following:—

Tillandsia fenestratis, t. 6898.—The figure of this noble Bromeliad is taken from a plant that formed part of the collection of living plants of this order purchased for the Royal Gardens, Kew, from the representatives of the late Professor MORREN. As a foliage plant the broad leaves are remarkable for the numerous dark green veins which form little chequers or squares on a lighter-coloured ground. The flowers here shown are borne on an erect unbranched scape, bearing its yellowish flowers in two rows, each flower being about 2 to 2½ inches long, with green calyx and primrose-yellow corolla. The flowers exude an acid secretion tasting of vinegar, and which reddens litmus paper.

Begonia Johnstoni, t. 6899.—An interesting plant, inasmuch as it is a native of the tropical African mountain, Kilimanjaro, presuming the plant to be the same as that collected by Bishop HANNINGTON in the Masai country, a district far to the north-west of Kilimanjaro. The species has erect stems, oblique lanceolate crenate leaves, and clusters of small pink flowers.

Leontice Alierii, t. 6900.—An interesting and pretty plant, discovered by ALBERT REGEL in the Western Alatau Mountains between Tashkend and Samarcand. From a subglobose tuber proceed two stems, with large oblong leafy stipules at the base of the long stalk, the blade of the leaf being palmately divided into five oblong, broad, obtuse segments rolled inwards in the young state. The flower-stalk is erect, provided near the apex with leafy bracts, from whose axils proceed yellow flowers, forming a pyramidal raceme, each flower being nearly 1 inch in diameter. The conformation of the flowers is curious, like that of most of the genera of the order to which it belongs (Berberidaceæ).

Calchicum Troodi, t. 6901.—A very pretty species, flowered by Mr. ELWES in his garden at Cirencester. It is a native of the island of Cyprus, and has a corn like a Chestnut, from which is thrown up in late autumn a tuft of numerous white flowers, each with a very long slender tube and a limb divided into six linear oblong segments. The leaves do not appear till the following spring; they are long, strap-shaped, and rounded at the tips.

Iris Eufelski, t. 6902.—A native of Eastern Turkestan, with bearded flowers of a generally lilac colour, but described as of extraordinary beauty and delicacy, very difficult to describe. The plant dies down late in autumn, and does not shoot again till March or April. The plant has flowered in the collection of Professor FOSTER, also in the Botanic Gardens of Kew and Cambridge. Professor FOSTER says that it should be kept dry and under glass in summer in the same way as *I. Iberica*.

— "MALESIA."—The last part of this fine publication is devoted to the description and illustration of various Asiatic and especially Bornean plants collected and observed by Signor BECCARI. Signor UGOINI MARTELLI describes the *Dilleniaceæ* collected by the same indefatigable explorer. Six lithographic plates, illustrative of structure, accompany the text.

— ORCHID SEEDS.—In a communication read before the Paris Academy of Sciences (*Comptes Rendus*, ciii., p. 357), and quoted in the *Pharmaceutical Journal*, M. PAUL MAURY points out that in the greater number of indigenous Orchids the ovules are not fully developed when the pollen-masses are ripe, and consequently it is only the ovaries at the base of the inflorescence which usually have fertile ovules, these being probably fertilised by the pollinia of the upper flowers. This slow development of the ovules may, he thinks, account for the remarkable tendency to hybridise manifested by many genera of Orchids.

— ERYNGIUM PANDANIFOLIUM.—The plant exhibited by JAMES BATEMAN, Esq., from his garden at Worthing, at South Kensington, before the Floral Committee on Tuesday, was not a large one when planted out last spring in the open border, where it grew freely, and in a very short time from its showing flower produced the stem shown, which (measuring from the base) was upwards of 10 feet high. The leaves were some of them 8 or 9 feet long, and the general aspect of the plant very imposing.

— CHISWICK YOUNG GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—Under this title a society, which promises to be very beneficial from an educational point of view, was inaugurated on the 8th inst. amongst the men employed in the Royal Horticultural Society's gardens at Chiswick. Mr. A. F. BARRON was invited to act as President; Mr. JOHN FRASER, of Kew, to whom the idea is due in a great measure, was appointed Chairman, and Mr. J. BARRY, Secretary. Papers (with discussion) on various subjects connected with horticulture were announced to be read at future meetings.

— TONQUIN BEANS.—Reporting on the trade in Tonquin Beans (*Diptyx odorata*) our contemporary, the *Chemist and Druggist*, says the crop of this article, especially the Augustura variety, has been an abundant one, amounting, it is said, to 150 tons, which would suffice for two years' consump-

WHITE CLEMATIS JACKMANI. (NOBLE).

tion, but the quality is stated to be below average. Nearly the whole has been consigned to New York, where all stocks are held by speculative operators, who seem firmly resolved to hold out for high prices. The British Consul at Bolivar, in Venezuela, in his report for 1885, just published, states that last year no Beans whatever were gathered in his district. The natives would not take the trouble to go to the Caura forests to collect the fruit, on account of the low prices at which they are compelled to sell it to the agents of the parties who hold the exclusive privilege of collecting and exporting the vegetable products of the immense forests of the territory of the Caura.

— PLANTING IN THE ISLE OF MAN.—Extensive planting operations have taken place on the Crown lands in this interesting island during the last four years. In 1882 contracts were entrusted to Messrs. LITTLE & BALLANTYNE, Carlisle, which involved the planting of 3½ millions of trees on five hundred acres of mountain land; and it is the success of these extensive operations which has led the Commissioners to go further into this important matter, and extend the number of trees annually. A competent forester from the Carlisle nurseries is in charge of the plantations and superintending the planting under the Department, which is now done as far as possible by native labour. Half of the trees which are to be planted this year have been again obtained from Knowfield.—Forest tree planting is about to be done on an extensive scale in the Isle of Man on the Crown lands, where shelter is much required. During the past week the Commissioner of Woods and Forests inspected and purchased over 300,000 forest trees from the well known Hexham nurserymen, Messrs. WILLIAM FELL & Co., who tendered with samples for the supply and succeeded in securing this extensive order from the Government. Messrs. DICKSONS, of Edinburgh, and Mr. MITCHELL, of Stranraer, have also received orders. The Commissioners of Woods and Forests, having adopted the wise policy of putting down a mountain nursery to nurse and acclimatise the trees before being finally planted on the mountains, will insure greater success than when trees are removed from a distance direct to their permanent situations. We believe that Mr. MITCHELL has been commissioned to supply many timber trees less known than older ones, but which are doubtless destined to supplant them—e.g., the Douglas Fir, the Nordmann Fir, and Thuja gigantea.

— SEEDS OF EUROPEAN PLANTS IN THE TROPICS.—M. THIERRY, the Director of the Botanic Garden at Martinique, asserts that seeds of European plants lose their vitality much sooner in the tropics than in Europe; thus Cabbage seed does not retain its vitality for more than eight months instead of from eight to ten years in Europe; Artichoke three months as compared with five years; Lettuce three to five months instead of as many years; Peas four months against four years, and so on.

— A HAILSTORM NEAR PARIS.—The losses occasioned by the hailstorm of August 23 in the Department of the Seine, are estimated by a committee of the National Horticultural Society of France to amount to 5,500,000 francs (£220,000), thus distributed:—Florists, 2,500,000 francs; market gardeners, 1,500,000 francs; fruit growers, 1,500,000 francs. Great injury was done at Montreuil, where Peaches, Pears, Calville Apples, and other fruit, are grown against the walls. On these walls, especially those facing west and south, the fruit was battered to pieces, and the trees themselves destroyed. The Vines, of course, suffered proportionately. A loss of such severity will of necessity, from the circumstances of the case, be felt for several years. Among the market gardeners of Vincennes and Montreuil no fewer than 35,000 *cloches* are destroyed, while the growers of market plants and cut flowers had their houses with their contents utterly destroyed.

— ANTHURIUM MOOREANUM ×.—In our number for August 21, p. 230, Mr. N. E. BROWN described an Aroid cultivated by Mr. W. BULL under this name, and added that the native country was unknown. With reference to this plant Messrs. CHANTRIER FRÈRES, of Montefontaine, write as follows:—"Anthurium Mooreanum × is one of our hybrids, procured by the fertilisation of *Anthurium crystallinum* by pollen of *A. subsignatum*. It

was dedicated to Mr. F. MOORE, of the *Gardeners' Chronicle*, who saw the plant in our establishment." With this letter Messrs. CHANTRIER enclose an extract from their Catalogue for 1885, in which they give a description of the plant, stating that the leaves attain a length of 80 cm. by 50 cm. in width, supported by thick cylindrical stalks 50–60 cm. in length. The blade of the leaf is oval, with the basal sinus moderately wide, the primary and secondary nerves prominent on both surfaces, with a tendency to assume the form of *Anthurium subsignatum* in its rounded basal lobes. The leaf is above of a deep shining metallic green, with silvery-white nerves.

— UNSEASONABLE FRUIT AND FLOWERS.—The warmth of the season has, in the garden of Mr. J. WILLING, at Cricklewood, as in many other places, induced the Laburnum to put forth its long racemes, on the upper part of which the seed pods have formed; and the Raspberry to bear a late crop of fruit. That good sort of Gooseberry, Red Warrington, also comes to us from this garden in good eatable condition. Botanists who are familiar with the structure of these plants will not see anything very marvellous in such facts.

— LIQUORICE CULTURE IN DAMASCUS.—A considerable amount of business, it seems, has recently been done in Damascus and Syria generally in the exportation of Licorice root to the United States. About four years ago, one of the partners in an American firm in Philadelphia largely concerned in the commerce of this article, visited Damascus with the object of ascertaining the amount and quality of the Licorice root grown in the country, and of making purchases. The result of his enquiries having proved satisfactory, he gave orders for somewhat large consignments to be shipped to the United States, and appointed an American gentleman in Beyrout, well acquainted with the language of the people and having a thorough knowledge of the country, to act as agent of the firm. The Licorice root can be obtained in considerable quantities to the north of Damascus, and in the neighbourhood of Lattakia and Aotioch, and a regular business is now being carried on in this article. The amount exported last year from Damascus and other parts of Syria was valued at £30,000.

— LINNEAN SOCIETY.—Meetings of this Society will be held at Burlington House, on the following Thursdays, at 5 P.M.:—1886: November 4 and 18; December 2 and 16.—1887: January 20; February 3 and 17; March 3 and 17; April 7 and 21; May 5 and 24 (anniversary meeting at 3 P.M.); June 2 and 16.

— TRITOMAS.—M. LEBEUF makes a suggestion in a recent number of the *Garden* that growers of these plants should send specimens to the botanist most competent to deal with the subject and should moreover, subscribe a sufficient sum to defray the expenses of printing the monograph. The proceeds of half the copies sold it is suggested should be handed over to the botanist as his honorarium, the moiety to be sold for the benefit of any horticultural work that may be decided on. This is a new idea. The weeks and months and sometimes years that a botanist labours at a monograph without thought of fee or reward, are little appreciated or known to outsiders. If the time occupied and the drudgery undertaken by a competent monographer be considered, it must be admitted that a daily labourer receives far better wage than the man of science unless he be an engineer or a chemist who both contrive to make science pay, while the botanist but rarely gets paid at all, or when he is paid gets little more than the cost of pens, ink, and paper. This is a monstrous injustice to the botanist, but we fear M. LEBEUF's proposal, even if it were carried out, would not do much to meet the evil. In this matter of Tritomas, M. LEBEUF has overlooked the fact that Mr. BAKER has already monographed them in the *Journal of the Linnean Society*, vol. xi., 1871, p. 361, under the generic name of *Kniphofia*, and that he has supplemented that monograph by a synopsis of the Cape species in the *Journal of Botany*, 1885, p. 277. Several are figured in the *Botanical Magazine* and in the *Revue Botanique*. The cultivated species mentioned by Mr. BAKER are *K. sarmentosa* (Tritoma media, *Bot. Mag.*, 744); *K. pumila* (*Bot. Mag.*,

764); *K. Burchelli* (*Bot. Reg.*, t. 1745); *K. præcox* (*Revis. Bot.*, 168); *K. Roperi* (*Jardin Fleuriste*, t. 368, and *Garden Companion*, i., 113); *K. aloides* (*K. uvaria*, *Bot. Mag.*, 4816, *Tritoma uvaria*, *Bot. Mag.*, t. 758); *K. infundibularis* (*Journal of Botany*, 1885, p. 277); *K. Macowani* (*Bot. Mag.*, 6167); *K. corallina* ×, Hort. Deleuil, a hybrid between Macowani and aloides; *K. caulescens* (*Bot. Mag.*, t. 5946). It should be stated that in his more recent recension Mr. BAKER includes under *K. aloides* (*alida uvaria*) the variety maxima, *Bot. Mag.*, 6553, which is the *Tritoma grandiflora* of some gardens. The *K. præcox* of BAKER is referred to this variety also as the *Tritoma Saundersii* of CARRIÈRE. The var. *nobilis* is a still more robust form, figured in the *Revue Horticole*, 1885, p. 252. Altogether, much as we should like to see a monograph of *Kniphofia* with good illustrations, there is a multitude of genera in which the need is much greater.

— THE ROMAN FIG.—*Apropos* of the recent discussion as to seedling Figs it may be of interest to note that in the *Hortus Duraventi* (1813), a nursery catalogue drawn up on a scientific plan, it is stated (p. 112) that the Roman Fig must be considered as a curiosity merely, it being planted by that people against the south-east side of the fortification Regubium, now Reuculer, where it still grows in a wild state, and occasionally produces a fruit that attains perfection. It would be very interesting to know if that Fig is still in existence at Reuculer, and still more so to know whether it produces seed. If some correspondent in that neighbourhood could secure a specimen of the fruit and foliage it would be very interesting, for whether it be of Roman origin, or whether, as seems more probable, it was planted by monks in later times, the fact remains that Mr. MASTERS, who was an excellent observer, with a good knowledge of botany, speaks of it as growing in the "wild state," and as "a curiosity."

— NEW SEEDLING PEAR.—The Pear, British Queen, exhibited by Mr. LAXTON, Bedford, at the Royal Horticultural Society's Show at South Kensington on Tuesday last, has been re-named Laxton's Bergamot, as there is already a Pear, British Queen, raised by the late Mr. THOMAS INGRAM, Frogmore.

— INDIAN FORESTS.—Mr. RIBBENTROP, the officiating Inspector-General of Forests to the Government of India, has issued a "Review of Forest Administration in British India" for the year 1884–85. It comprises a series of statistical tables showing the area and boundaries of the forests in the several provinces of India, details of the surveys and working plans, statements as to the measures taken to protect and improve the forests, together with a statement of the working and yield, and the financial results. The reserved forests form about 5½ per cent. of the total area of British India. Protection includes the carrying out of forest ordinances as well as protection from fire. As to this latter matter, it is pointed out that the enormous progress that has been made at the cost of hard work, anxiety, and exposure on the part of officers of every grade can hardly be sufficiently appreciated from the mere study of the tables appended. Experience already proves that trouble and money expended will be amply repaid by the final results. As a rule, protection is sufficient to ensure natural reproduction of the forest even in districts which have been temporarily ruined by neglect and former ill-treatment. Adequate protection, and the exercise of patience seem all that is required in most cases. The most hopeless cases are those in which the surface soil has entirely disappeared, and where the rainfall is scanty; but even there we imagine the chinks of the rocks contain deposits of fertile soil which could be utilised. The general results for all the provinces show a surplus revenue of more than 3,000,000 of rupees. The export of Teak for the year in question amounted to 47,556 tons (each ton = 56 cubic feet), valued at 112 rupees per ton. In addition, the exports comprised caoutchouc, shellac, Cardamom, Sandalwood and other ornamental woods, Gambier, Myrobalsams, &c.

— ANNUAL ADMINISTRATION REPORT OF THE FOREST DEPARTMENT OF THE MADRAS PRESIDENCY, 1884–1885.—This report is drawn up on the same general plan as that for British India in general, but contains a formidable mass of detail, even the full return of stores and tools, such as rat-

traps, measuring tapes, penknives, rulers, and all the armentarium required in the forests themselves or in the several offices are printed, with tabular statements of the number received or issued, their destination, value, and the comparative statements with past years. As some of the names of the native villages comprise some eighteen or twenty letters each, such as Sakaraparayakanir or Saluppaiyayannattamkamoy, it is evident that the printing account of the Madras Government must be somewhat high, and it is questionable whether the cost of printing the record and destiny of the boxes and the like does not, in many cases, outweigh the value of the articles themselves. In the Anamalai Mountains natural reproduction does not seem to be satisfactory, and planting will have to be carried out. Valuable lists of native trees, with the vernacular names, are appended.

NATIONAL CHRYSANTHEMUM SOCIETY.

The usual October general meeting of members of the above Society took place at the "Oll Four Swans" Tavern, Bishopgate Street, on Monday last, E. SANDERSON, Esq., President, in the chair, there being a large attendance of members. The minutes of the annual general meeting of January 26 last having been read, the Honorary Secretary announced that the first summer show took place at the Royal Aquarium on September 10, and proved highly encouraging as an experiment, the sum of £68 5s. having been awarded in prizes: also that application had been made by societies affiliated with them for forty-one medals and forty-three certificates. Twenty-four new members were proposed and elected, bringing the number up to a total of 360 in all. As showing the remarkable growth of the Society it may be mentioned that when Mr. W. HOLMES became its Honorary Secretary in 1874, there were fifty-seven members and a sum of something like £50 was offered in prizes. When the Society adopted its broader designation of National, about three years ago, there were just over one hundred members, now there is the large number just stated, and about £250 was paid in prize-money in 1885. The Honorary Secretary announced that Messrs. WOOD & SON, coal merchants, of Colney Hatch, had offered special prizes for Chrysanthemums, which would find a place in the schedule for 1887. The Honorary Secretary was empowered to make all necessary arrangements for the great show on November 10 and 11. Some discussion then took place in reference to the Reserve Fund, which consists of something like £80, and a resolution was unanimously passed directing the Honorary Secretary to communicate with the Treasurer with a view of placing the fund upon a more satisfactory basis. A cordial vote of thanks to the President closed the proceedings.

BARLEY EXPERIMENTS.—Professor GILBERT has published in the *Agricultural Students' Gazette* the lecture delivered by him at the Royal Agricultural College, Cirencester, and comprising an account of the experiments on the growth of Barley for more than thirty years in succession on the same land at Rothamsted. These experiments were conducted on the same plan as those for Wheat already discussed, and they illustrate the influence of exhaustion from long cropping, the effect of manures, and of variations of season. The general results show a close correspondence with those of Wheat when allowance is made for the fact that Barley is a spring-sown crop, and the Barley has less time to develop itself. Wheat, moreover, has a much greater root range than Barley which is more dependent for its food supplies on the surface soil, hence the decline of produce on the continuously unmanured plots is considerably greater than in the case of Wheat. The paper, like others that emanate from Rothamsted, is replete with statistical details, which are of the highest value for reference, and will ever continue to be so, for nowhere is there such a record of the effects of manure and season on the growth of plants, and physiologists and practical men must continue for long to base their work on these details. By way of illustration we may mention, that it is found at Rothamsted that the better the straw, the less the proportion of silica in it—a result amply borne out by the experiments, but one at variance with preconceived opinions. The strength of the straw depends more on the favourable development of the woody substance. The abolition of the malt-tax has not been productive of the advantages that were anticipated. "It would seem that the high duty served as

a bounty on the higher qualities of our own production, and that when this was removed the greater demand for medium qualities has given an advantage to the foreign grower." Nor has the removal of the duty led to an extended use of malt for feeding purposes. This is in accordance with the opinion long ago expressed by Sir J. LAWES and Dr. GILBERT as the result of experiments at Rothamsted. Barley, like Wheat, exhausts the soil of nitrogen, and also in greater proportion than Wheat takes up mineral matters; hence it is more directly benefited by superphosphate and mineral manure than Wheat. These comparative studies on the life-history and requirements of two grasses are not only of direct practical importance, but most valuable contributions to the physiology of vegetation.

TOBACCO IN HAVANA.—In a report on the trade of Havana it is stated that the prospects for 1886 were very good, the crops were very large, and the guano is now nearly worked out of the ground, which will make a large difference in the flavour of the ordinary crops. It is further stated that at the Antwerp Exhibition, 1885, where Tobacco of all climates formed one of the main exhibits, the highest awards were all obtained by manufacturers of Havana.

PLANTS UNDER MORE THAN ONE NAME.—It is alleged that the new Rose, *Schöne Namenlose*, raised by M. DERGEN, and sold by him for 1000 marks, has been renamed *Kneza Leontie Fürstenberg* (Fürstine Leontine Fürstenberg), and that it is offered to the trade under both names. If the facts be as stated, the practice is reprehensible.

CYPRIPEDIUM SEDENT.—A correspondent sends a flower of this species with a flat lip (regular perioria), and a column with three stamens, a 1, a 2, a 3. The three sepals were also separate—an interesting case.

BANANAS IN TENERIFFE.—The exportation of Bananas from Grand Canary is reported to be considerably on the increase, and it is expected that it will soon become one of the principal exports, as direct communication between Grand Canary and London is established. During last year from 40,000 to 50,000 clusters of this fruit were shipped to Europe, averaging 3s. per cluster, Grand Canary alone contributing between 25,000 and 30,000 clusters.

GARDENING APPOINTMENTS.—Mr. H. MUNDAY, Gardener to the late R. C. RANSOME, Orwell Lodge, Ipswich, has been appointed Head Gardener to W. H. TREGO, Esq., The Brokes, Reigate, Surrey.—Mr. A. PORTEOUS, late Gardener, Aldenham Abbey, has been appointed Gardener and Bailiff to B. E. GREEN, Esq., Midgham, Reading, Berkshire.

FREE-FLOWERING CLEMATIS.

[SEE EXTRA SHEET.]

PROFUSION of bloom rather than size in the individual flowers is the essential requisite to make a plant really effective, especially in such things as are intended to be seen in mass. A favourite exhibition Rose with its finely shaped blooms is beautiful, yet it is insignificant compared with an example of a climbing variety allowed to scramble on the side of a house, or the stump of a tree bearing quantities of flowers individually inconspicuous, but which, when seen in their thousands, put the small tree with its half dozen faultless flowers in the shade; so it is with Clematis. The flowers of the profuse blooming Jackmanni section are deficient in size as compared with many of the large varieties, still what they lose on this score is more than made up for by the immense sheet of bloom the plants bear. Not the least remarkable thing connected with gardening is the length of time it often takes for a desirable plant to become sufficiently known. Most people at all conversant with gardening matters are acquainted with C. Jackmanni, and only a little less so with its nearest relative, C. rubella, the only fault of which is that, though differing in colour, it is still, in this respect, too near C. Jackmanni. Several others of the same type there are, varying from dark mulberry to reddish-claret, but none of these have made their way in the estimation of the gardening community as C. Jackmanni has done through the fact of their not being sufficiently distinct from it in colour.

In the case of plants that come freely from seed when a cross has once been effected it does not often happen that there is any great length of time to wait before varieties sufficiently distinct in colour appear. But with this section of Clematis it has not been so, for until C. Jackmanni alba turned up with Mr. Noble there was a blank in this direction; and it seems that after a new variety of Clematis has been obtained more time is required to decide its merits than is necessary with most plants. I understand that it is something like eighteen years since C. Jackmanni alba was raised, and it is only within the last half-dozen years that one peculiarity connected with it has appeared, and which, by the way, is no doubt directly traceable to its parentage. The plant is, I believe, the result of crossing C. Jackmanni with the pollen of one of the white varieties of the patens type, which are spring bloomers. Five or six years back the plant began to produce a few flowers in spring, the time the patens section blooms; these were ragged muddy-coloured abortions, as indifferent in appearance as they well could be; and each season since a few of these have appeared, even on plants that are quite small. After this the growth that bears the full crop of autumn blooms goes on. It is best to pinch off these useless fugitive flowers as soon as they are seen. The illustration is from a photograph of the plant in the Sunningdale Nursery, as it appeared in the latter part of August; it covers a pole about 10 feet high, showing its floriferous character in a way that requires no comment. It is a robust, free grower. When the plant has acquired sufficient strength, it keeps on growing and producing flowers more or less until late in the autumn. This disposition to produce flowers in the spring of a different character to those forthcoming in the autumn is not confined to C. Jackmanni alba, alone. *Proteus*, a light coloured variety raised by Mr. Noble, produces each spring a crop of flowers perfectly double, and almost as large as a moderate sized Peony. After these are over the plant makes fresh growth, blooming freely again in August, but at the second flowering the flowers are all single—not the least sign of doubleness about them. They are six-petalled, and about 5 inches across. The plant is well named after the myological representative of all change, but there is nothing formidable in the appearance of its flowers.

C. *viticella rubra grandiflora*, a late-blooming variety, one of the *viticella* section, which comes in at the same time as the Jackmanni division, though apparently little known, is one of the best and most distinct coloured in cultivation. The flowers, when newly opened, are bright ruby-red, getting darker with age. It is a profuse bloomer, a plant in the Sunningdale Nursery—growing, like the others, on a stout pole—was covered with a mass of flowers that almost hid the leaves. If asked to name three distinct coloured autumn-blooming Clematis that give a profusion of flowers I should say C. Jackmanni, C. J. alba, and C. *viticella rubra grandiflora*.

REPORT ON SOME KINDS OF SEEDS OF THE HARVEST, 1886.

Messrs. J. CARTER & Co., Holborn, London, send us the following:—

Red Clover.—The English crop, although not large, will be a very good one, as the fine summer and autumn has been most favourable to its development. The reports from Germany, France, Denmark, Italy, and other producing districts, vary considerably, the general estimates appearing to point to an average crop. American reports are, if anything, less promising than last year, the general opinion indicating that supplies will not be more than is likely to be required for the home consumption. Judging of the standard qualities from samples that have come into our possession, they are very sickly and poor in appearance, when contrasted with European-grown seed. It may therefore be reasonably expected the red Clover crop taken all round will be of quite an average character, and the quality of the English and European samples may be taken to range even better than those of last year.

White Clover.—There is again a fair average crop of good English seed, which must have been harvested in excellent condition. The predictions we have made in earlier reports as to the probable Continental output have been more than confirmed, and it is now an undeniable fact that the crops, both in Europe and America, are deficient in quantity and quality. In Moravia and Bohemia especially the crops are exceedingly meagre, whilst Galicia and Poland fine qualities will be few and

far between. In Austria and Hungary crops are reported exceedingly small, and the bulk of inferior quality.

Timothy.—As usual some pretty English samples are advised as coming forward; reports of the Continental crop are uncertain at present, the general opinion being that the average will turn out a satisfactory one. It is rather early yet to expect reliable reports from Canada and the United States, but it will be remembered these districts produce such small quantities of this seed as to have little or no effect upon the market.

Trefoil is again an average crop, both in English and foreign seed, and no perceptible advance is expected for some time. Samples are bold and of good colour.

Lucerne is reported a little below the average, but some samples of excellent quality have come before us.

Timothy.—The dry season in the United States has had the effect of considerably shortening the crop of this seed, and from the same cause the seed is more hulled than usual. On the other hand, the German crop is reported better than usual.

Italian Rye-grass.—The English, Irish, Scotch, and French crops are very large and of excellent quality; in fact, the present price for French grown is lower than it has been for many years. The samples of home-grown seed that we have handled show fine quality.

Perennial Rye-grass.—This proves to be an abundant crop both in Ireland and Scotland, and excepting where the rainfall has been exceptionally heavy, samples are bright in colour and of excellent quality; the natural weight per bushel is also heavier than the last few preceding years.

Rape continues remarkably low in price, and samples of the new crop bear indications of very fine quality. Unusually low values may be expected to rule for this article for some time.

Mustard.—A good average crop, of fine quality and bright colour.

Canary and Hemp.—Fair average crops.

Sweet and Turnips.—In quality exceedingly good, but the crops have come in short in some districts, whilst in others the very favourable summer and harvest has tended to devalue exceeding in quantity the earlier estimate formed of the probable quantities.

NATURAL GRASSES.

Anthoxanthum odoratum.—This grass is reported to be only about a one-fourth average crop, owing to frost during the time the plant was in flower.

Agrostis stolonifera.—Both in Germany and America this is reported to be an average crop of fine quality.

Alopecurus pratensis is probably one of the shortest harvests for many years, and a large proportion of the samples show an exceedingly low range of germination.

Cynurus cristatus may be taken generally to be quite an average crop, the samples of Dutch grown seed being remarkable both for colour and germination. On the other hand, the German and Irish samples are all more or less damaged by rain.

Dactylis glomerata in all producing districts is a very large and excellent crop, giving a high standard of vitality.

Elyca tenuifolia.—This crop is almost a failure, and it is fortunate that its principal use is in the formation of mixtures for lawns and pleasure-grounds, as there is not a sufficient supply of the seed in reliable quantity to meet any demand that might be created for the purposes of permanent pastures.

F. duranensis is a heavy crop, and the seed is of excellent quality. Prices must range lower than usual.

F. pratensis.—The crop of this important grass is also a most satisfactory one, whilst the germination of such samples as we have tested has proved exceedingly good. Present prices rule very reasonable, and may be expected to continue.

F. elatior.—This grass is still exceedingly scarce, the principal source of supply being from the Australasian colonies. The average quality may be described as very good, and the germination up to the usual standard.

Poa trivialis and **P. nemoralis.**—Both are reported as scarce, the damage to the crops by rain being very great.

P. pratensis, on the other hand, both in Europe and America, is reported to be a large crop, and all the samples we have seen give signs of excellent quality.

There is always a great range of values in these goods, as the price entirely depends upon vitality and purity. As usual there is an abundance of low quality seed upon the market at all sorts of prices.

are they particularly distinct or attractive in colour. In fact, it is too milky to be worth growing for garden decoration or for cut flowers, and is not good enough for exhibition, being just one of those worthless varieties that ought never to be distributed. *T. W. Girdlestone.*

Notices of Books.

The Flora of Oxfordshire.

MR. DRUCE'S *Flora* of this county has been recently published by Parker & Co., of Oxford. It is on the plan of Trimeo and Dyer's *Flora of Middlesex*, and is preceded by an interesting introduction. While the flora of the immediate vicinity of Oxford is well known, it must be remembered that the city itself is on the borders of Berkshire, in which county the rich hunting ground of Bagley Wood is situate, and that the outlying districts of the county are little known by Oxford residents, who will, in consequence, be under obligations to Mr. Druce. Mr. Druce enumerates in all 910 species, a rather large number, and the enumeration is enlivened by numerous illustrative notes from the author's own pen, or from the works of his predecessors. A very interesting part of the work is his chapter on the botanists connected with Oxford, among which we find an appreciative note of the labours of the late William Baxter, one of the keenest botanists that have ever contributed to the knowledge of British plants; but we miss any account of the "weeds" of the Botanic Garden, which from the long establishment of the garden are of an interesting character, and some of which have spread in the neighbourhood. No doubt *Senecio squulidus*, the greatest ornament of the Oxford woods, was originally an escape from this garden. Transported from the dry oolitic walls to the flower garden, the plant alters its character, becomes much more robust and luxuriant, and produces a profusion of long-continued flowers; but, in any case, it belies its name, for it is a particularly ornamental plant, and how or why Linnaeus called it *S. squulidus* is a mystery. Oxfordshire, from the variety of its soil, is particularly well suited for investigation of the relation between the nature of the soil and the character of the plants growing on it, but this is a subject but little attended to in the present volume. Mr. Boswell adds a list of mosses and Hepaticae, and other lists are given of Lichens and fungi.

Origin of Cultivated Plants.

A third edition of M. Alph. de Candolle's *Origine des Plantes cultivées* has been recently published by Felix Alcan, 108, Boulevard Saint Germain, Paris, the text having been revised and a few additions made. Amongst other things reference is made to Mr. Baker's paper on the tuberous species of Solanum and to his opinion that the *S. Maglia* of Molino and Danal was not the origin of the cultivated *S. tuberosum* as Sabine, Lindley, and Darwin, and A. de Candolle himself, considered. Had M. de Candolle been aware of the result of the experimental culture made by Messrs. Sutton at Reading this year, he would have been more than ever convinced of the correctness of his views, for it is certain that *S. Maglia* received from Kew, and cultivated by Messrs. Sutton, has this year gone away from the *Maglia* form and assumed very much that of ordinary *tuberosum*. It may be added that some mistake has crept into M. de Candolle's work at p. 374. The Potato flowers examined by Dr. Masters were grown at Chiswick, not at Kew, as stated, and though some 150 varieties have been under observation only a small proportion have flowered, although all of those that did flower bore out M. de Candolle's opinion. As to the origin of the *Gossypium barbadense*, generally cultivated in Tropical Africa, it seems probable that it originated from the species described by Dr. Masters as *G. Kirkii*, a native of Zanzibar, but further evidence is required.

Illustrated Handbook of Victoria.

We have already alluded to this excellent handbook to the colony of Victoria, and to the display made by this colony at the Colonial Exhibition; but the receipt of a copy from the Commissioner gives us an opportunity of again calling attention to it. No one thinking of taking up his residence in the colony

should do so without consulting this richly illustrated volume. Mr. J. L. Dow, M.P., writes on the agriculture of the colony, Mr. W. Elliott on the horticulture, due credit being given to the unwearied labour of Baron Von Mueller, and to the energy of Mr. Basista. Public gardens are common throughout the colony, and many of them are described as very handsome—a statement borne out by the numerous photographs exhibited at the Colonial Exhibition. The condition of the Melbourne Botanic Garden reflects great credit on the director, Mr. Guilleloy. Numerous horticultural societies exist—one, the Royal Horticultural Society of Victoria, at Melbourne, having an experimental garden.

Subtropical Cultivators and Climates.*

The object of this book, as stated by the author, is to call attention to some of the lesser-known agricultural industries of subtropical regions, which are sources of wealth to the inhabitants, but which are almost unknown to the ordinary class of settlers in our Australian and other colonies. With the exception of Sir Ferdinand Mueller's *Select Extra-Tropical Plants*, we had no book which dealt authoritatively with this subject, and Mr. Haldane's carefully compiled and eminently practical work is destined to have a useful career. It is given plain hints as regards the cultivation of fruits, alimentary plants, condiments, vegetable wax and tallow, oil-plants, fibres, drugs, tanning materials, dye-plants, as well as tables of the mean temperatures of subtropical countries in both the Northern and Southern Hemispheres. Mr. Haldane, himself an experienced and successful planter, brings to his aid a large and varied experience gathered in many lands, and hence his book is not merely a compilation, but the result of practical knowledge and observation, which fits it in a special manner to meet the requirements of "colonial settlers and emigrants." The chapters on Tea, Coffee, Olive, Fig, Orange, give within a short compass all that is necessary to enable an intelligent planter to draw his own conclusions as to the suitability of these industries to the temperature, soil, and climate of the country in which he dwells. Cinchona, although it bears a cooler climate than Coffee, is for some unexplained reason left out. The chapter on fibres is possibly the weakest in the book, for while it gives *Sorghum dura* as the first on the list of textile materials, it omits the celebrated China-grass, *Bemheria nivea*, and passes over the Agave hemp, which latter supply, next to hemp, the chief rope materials of the world. These and similar omissions will, no doubt, receive due attention in a subsequent edition, and by means of judicious pruning in such chapters as those on Tobacco, Cotton, &c., the size of the book need not be greatly enlarged. As a first attempt to deal in a practical manner with subtropical cultivations Mr. Haldane's book is decidedly a success, and the publishers have done everything they could to issue a neat and attractive volume.

CEYLON.

In a paper on this country the author says:—

Attention was first called to the fact that the island of Ceylon was practically known to Europeans only by its south-west part, being about one-fifth of the whole area, but including the chief European centres, the planting districts of the hills, and the railway system. The remainder of the country is thickly covered with jungle, thinly inhabited, and rarely visited by Europeans, save Government officials and sportsmen. This difference was shown to be due to climate, especially to rainfall. The distribution of the rain, so far as is shown by annual amount, was exhibited by a map, in which the great advantage to the south-west of the lofty forest-clad escarpment of the central mountain-mass of over 7000 feet was exhibited. The south-west monsoon wind commencing at the end of May deposits an immense quantity of rain here, especially in the neighbourhood of Adam's Peak. In the rest of the island this wind becomes dry, and the country is parched and arid until the arrival of the north-east monsoon, which commences in October. This wind brings rain to the whole island, and is the only rain which the dry districts get; in many places it all falls in a few weeks, when

* *Subtropical Cultivators and Climates.* A Handy-book for Planters, Colonists, and Settlers. By R. C. Haldane. Blackwood & Sons, 439, pp. 393.

† *On the Flora of Ceylon, especially as Affected by Climate.* By Henry Trimeo, M. B., F.L.S.

The Roseery.

ROSE ABBÉ GIRARDIN.

THE above Rose is a Bourbon variety sent out by Bernaix in 1881. It is not very vigorous, being of slender dwarf habit, though, like all Bourbons, it flowers freely in autumn. The flowers when opening are of a pleasing pointed shape, of a soft rose colour; but the bloom very rapidly opens out perfectly flat, and assumes a dull lilac tint.

It has been generally discarded, as it is not vigorous; its flowers are not large nor well enough formed, nor

the country is completely under water, though parched with drought for the rest of the year. This is very different to the well-known south-west of Ceylon, where, save in February or March, a fortnight's drought is a very rare event. In some parts over 200 inches falls in the year. In these respects Ceylon is an epitome or continuation of the southern Indian peninsula.

The peculiarities of the flora were then gone through in some detail, taking first the low country of the wet districts up to 3000 feet—in which the number of introduced tropical plants was commented upon; then of the lower hills, the principal home of the planning enterprise and Tea and Coffee estates; and next of the higher or true mountain districts above 5000 feet. In the low country the forest has been much destroyed by the indolent and improvident native mode of cultivation called *chena*, and but little virgin forest remains in this portion of Ceylon. From 3000 to 5000 feet the agent of destruction has been European planting, and the forest has almost wholly disappeared. Above 5000 feet land is no longer sold by Government. Attention was specially called to the concentration of endemic species in this wet district—over 80, or nearly 30 per cent. of the whole flora—and to the strongly Malayan, as distinguished from Peninsular Indian, type of these and of the whole flora.

There are no alpine plants in the Ceylon hills; dense forest covers their summits, but a number of temperate genera are represented. This flora is entirely Indian in type, with no genus represented which is not also found in the Nilghiris, but the number of endemic species is very remarkable, only about 200 being common to both mountain ranges.

A few remarks were then made upon the naturally open grass lands, called "patana," in the hills, and their peculiar vegetation. The flora of the great dry tracks of Ceylon was then considered. It is completely distinct from that already considered, being mainly the same as that of the Carnatic or Coromandel coast of India, with no Malayan admixture, and very few endemic species. The whole country is covered with forest, apparently primeval; but in reality much of it is secondary, and not more than 800 or 1000 years old, as is reported by native tradition, and evidenced by the vast remains of temples, tanks, and ancient buildings now overgrown with trees. Most of the timbers of importance in trade are obtained in these districts, and, owing to a very faulty forest conservancy, there is now but little first-class timber remaining, save in very remote places. The botanical character of this forest, which is everywhere evergreen, were given; and the paper concluded with a few remarks on the coast flora, which is very uniform throughout the tropical belt of the world.

TSUGA BRUNONIANA.

SOME short time since (July 17, p. 73) we were favoured by Sir Joseph Hooker with a very picturesque description of this beautiful Hemlock Spruce and a drawing of the tree as found in its native country. We have now the opportunity of figuring a branch with cones from the rich collection at Dropmore (fig. 101). As seen there, the plant in its present state forms a dense oblong bush rather than a tree, the trunk being concealed by the thick pendulous branches. The leaves measure nearly an inch in length, and are of a very beautiful silver-grey on the under surface. The young cones, too, which are ovoid pointed in outline, are of a beautiful glaucous colour. From many of them theaxils protrudes in the form of a small leaf-bearing shoot. We have also seen cone-bearing specimens from Mr. Rogers' nursery at Southampton, and from Mr. Farrant's grounds in the Isle of Man, and are familiar with the plant in various places, but nowhere have we seen it in more beautiful condition than at Dropmore. In most places it is considered tender. Representatives of this genus occur in north-eastern and in north-western America, in Japan, and in the Himalayas. The plants are like true Spruces, in their branches being provided with little peg-like projections; their pendulous cones with their persistent scales are also Spruce-like. Their flat leaves twisted at the base are more like those of the Silver Fir, but differing from all other Conifers in having one single resin canal in the centre of the leaf beneath the midrib.

All the Tsugas are of ornamental character, but so

far as is known, of little value as timber trees. They have not been long enough in the country to enable any judgment to be formed as to their value for timber. The Canadian species, the Hemlock of Longfellow's "forest primæval," is, however, valued here for the sake of its bark, which is used for tanning.

HOME CORRESPONDENCE.

Burnt Earth for Alpine Plants.—Cultivators of alpine plants know how difficult it is to maintain in a healthy state for any length of time those species which in their natural habitats are limited to the fissures of rocks, &c., of the small hard-foiled Saxifragas and Androsaces, which seem to delight, not in high living, but to support themselves on a bare hard rock-surface with little apparent food-supply. Three or four years ago I made some experiments on the pot-culture of such species, one set being planted in a mixture of grit, peat, and a little sand; a second in finely pulverised fire-brick; and a third set in finely pulverised soft red brick material. The ordinary treatment met with the ordinary result, the loss of a considerable proportion of the plants, the remainder becoming sickly and impoverished in a year or two. Those planted in the pulverised burnt brick-dust formed a marked contrast to the first set, not only in the proportion of survivors, but in the thoroughly healthy aspect of the plants. In one case all died that were potted in the grit compost, those in the burnt brick-dust remaining vigorous and healthy up to the present time. I believe that the most delicate alpine could be grown successfully in finely pulverised fire-brick refuse with a very slight admixture of peat and loam. Such a material insures perfect and immediate drainage, and from its absorbent qualities has the advantage of retaining the necessary moisture without becoming soddened. Burnt earth, calcined clay, and almost all burnt materials are absorbent of gases and ammonia, and thus become reservoirs of plant-food. The pulverised red-brick and pulverised fire-brick refuse produced very similar results, but I think they were slightly in favour of the ground fire-brick works, and is technically known as "ground sherds." *George Mau, F.L.S., Bentham, Kenley, Oct. 6.*

Influence of Heat and Moisture on Fruit Crops.—The contrast between the crops of the three principal tree fruits, viz., Apples, Pears, and Plums, this year and last, is so great that it is worth a moment's considering. It will probably be admitted that the conditions necessary for producing good fruit crops are,—1. A high temperature and moderate rainfall during July and August of the previous year. 2. An absence of severe (for the time of year) frost when the trees are in bloom. To these I venture to add—3. A rainfall of at least 2 inches (more or less according to the nature of the soil) in May, when the fruit is setting. Generally speaking in 1885 there were poor crops of Pears and Plums, and fair to good crops of Apples. This year there have been remarkable crops of Plums, good crops of Pears, and poor crops of Apples. In my own garden at Colwyn Bay, where my observations have been made, all three crops were poor in 1885, while this year there are the best crops of Plums and Pears I have ever known, and fair crops of Apples, some varieties having good crops and others none. The orchard is on a terrace slope facing south-east, and the soil is porous and warm, being a decomposed clay-slate with many stones. In the accompanying statement the temperatures are taken from daily observations on instruments verified at Kew and in a Stevenson case. As regards these—1. Temperature of preceding year.—In 1884 the mean maximum temperature for July was only 1° lower than in 1885, but the hot weather was chiefly at the beginning of the month, when growth was or ought to have been going on, and there were 4.43 inches of rain. In July, 1885, the hot weather was from the 22d to 31st, without rain. In August, 1884, there was the unusually high mean maximum of 70°.6, the hottest weather being from the 1st to the 24th, with little rain. In August, 1885, there was a mean maximum of only 64°.7, the daily maxima being continuously above 65° for one week only, viz., from the 20th to the 26th. The difference of rainfall in the two years was not material. 2. Frost at time of blossoming.—In 1885 the lowest temperature registered in May (the Pears and Plums were not fairly in bloom till the first week in May) was 35°.3. The lowest in April, 32°.3, on the 17th, 1886.—On April 30 the thermometer registered 28°.7. An entry in my diary on May 9, that "many Pear trees have shed their petals," shows that most of them must have been in bloom on April 30. This is further shown by the fact that the Pear trees at the bottom of the hill in my kitchen garden have scarcely a Pear on them, the frost being, of course, more

intense at the lowest point. 3. Rainfall in May.—In 1885 this was 1.41 inch, in 1886 4.91 inches. We see, therefore, as regards the crop of 1885 that there was in July, 1884, a fairly high temperature at the beginning, but a high rainfall. August was an unusually hot and dry month. There was no frost in 1885 at the time of blossoming. So far all is favourable to, at all events, a good crop of Apples. But the total rainfall for April and May, 1885, was only 2.93 inches. Taking now the crop of 1886, we have hot weather at the end of July, 1885, but a very cold August, and a sharp frost at the blossoming time of Pears and Plums. But the total rainfall for April and May, 1886, was 7.29 inches. The inference I draw from the above facts is, that to have good crops of Pears and Plums it is necessary that the latter half of the preceding July should be hot and dry, and for Apples, the first three weeks of August; while for all three a considerable rainfall in May is necessary. Spring frost had no effect when the trees were properly planted, i.e., Pears and Plums at the top of the slope and Apples at the bottom. This plan I adopted in planting my orchard, with the result that, in spite of thinning, there are breakdown crops of Pears in it while the older trees in the kitchen garden at the bottom of the hill have, as already stated, no crops. I would only add that, as we have not had a decent crop of Pears since 1879, periodically will hardly account for it. If Plums have never before had a fair crop, it is much to be noted that in our garden; our summer are not hot enough. In my garden here (Chester) there is the finest crop of Pears I ever remember. Old standard trees have borne a crop which never did before—at all events, since 1870. *Alfred O. Walker, Chester.*

A Primula Sport.—One of the oddest of foliage sports from the Chinese Primrose I have yet seen Mr. James has in his capital collection of those Mr. Weddell, Farnham Royal. The parent of the sport is a semi-double bright red, which again sported from the Chiswick Red. But in the case of the new sport, of which there are six plants, and all from a batch of seed of the semi-double, saved and sown this year, has leaves utterly unlike that of any ordinary form of Primula; indeed, they are about the size and shape of Cyclamen leaves, or perhaps more nearly resemble those of Saxifraga sarmentosa, being almost rounded, and the slightly serrated at the edges. The stems are of the usual length, and dark red in hue. It will be exceedingly interesting to note what kind of flowers and floral habit will be later shown on these plants. *A. D.*

Helianthus latiflorus.—Amongst many gay autumn flowering plants which now brighten my garden on October 6, none surpasses *H. latiflorus* (Persoon), of which I have sent four flowers. This plant might easily be considered a tall late variety of *H. rigidus*; but Asa Gray's highest authority in this class—has confirmed it as a most distinct species. The differences, however, are slight and hard to define. *H. latiflorus* in my garden is six weeks or two months later, and nearly 2 feet taller, than *H. rigidus*, reaching to nearly 7 feet. Asa Gray notices also a slight difference in the arrangement of the involucre bracts, which I have found more conspicuous in the bud than in the flower. The disc of *H. latiflorus* when in flower, is less dark than that of *H. rigidus*. The former is more limited geographical range, being confined to the States touching Lake Michigan on the west and south. The flowers I have sent are of a semi-double form, a variation often assumed in cultivation by this section of Sun-flowers making them more ornamental. *C. Wolley Dod, Edge Hall, Malpas, Oct. 6.*

The Potato Crop and Cultivation.—The early and second early varieties suffered somewhat from drought during the early part of the season, but the crop has been good and free from disease, the tubers being rather smaller than usual. The varieties to which I allude are, Veitch's Ashleaf, Myatt's Ashleaf, Early Caldstream, Beauty of Hebron, Covent Garden Perfection, and Welford Park Kidney; International, with us, was very badly diseased. Late varieties, which we have not sown much of this year, are most excellent, both as regards quality and being free from disease. Yorkshire Hero and Schoolmaster are two excellent varieties for dining-room purposes; Reading Hero and Snowflake also crop well; Magnum Bonum is a heavy crop, and much larger in size than last year; Wornleighton Seeding is also an excellent crop. This variety carries us through for supply till new ones come in again, in quantity, next year. I find in cultivation (after some years' experience) that leaf-soils suit the requirements of the Potato better than anything else in the shape of manures; and I use it largely for this purpose. I have annually raised together in the park, from forty to fifty waggon-loads of leaves, principally Oak and Beech, which I use for the plunging of Pines, forcing Potatoes, and a variety of other purposes; and after it has served this purpose I have it turned over once or twice to help decay, and then apply it to the

ground intended for Potatoes. It is suitable for either a wet or dry season, and it invariably produces a crop of tubers of the best table quality. *Edward Ward, Hewell Gardens, Bromsgrove.*

Picea ajanensis.—Referring to the note of your correspondent, J. Douglas, respecting *Picea ajanensis*, I could agree with him that it is a very pretty

silvery on all its surfaces. *P. ajanensis* is pretty because of its dwarf, compact habit. *P. Parryana glauca* is something more than pretty because of its free, robust, and vigorous habit, combined with a uniform silveriness. Mr. Douglas' note suggested to me the desirability of your correspondents indicating the situation or kind of soil to which their remarks apply. Mr. D. says, "Our ground is now parched

Planting-out *Bouvardias* during the Summer. —This practice has been followed during the past summer at the Royal Nursery, Slough, and with the best results. Three varieties appear to be in the largest demand—Humboldtii, Hogarthi, and Alfred Neuner. A goodly number of plants of these were planted out in the open ground as soon as danger from late spring frosts was over; they are now being lifted with good balls of soil to their roots and potted, placed in a cold frame, and kept a little close for a few days. They are already in bloom, and in a few weeks will be charming bushes of flowers; the growth is very robust, and the plants are all that can be desired in the matter of cleanliness. Humboldtii has large white long-tubed flowers, and it is the most fragrant of all, the perfume exhaled from the scented petals being much more noticeable in the evening than in any other part of the day. I have often seen *Bouvardias* summered in pots with great care and labour, and successfully, too, but they never appeared to me to possess the rich, vigorous, healthy, clean appearance the planted-out plants at Slough do. *R. D.*

A New Plant-Protecting Material.—Will you allow me space to call the attention of gardeners to Mr. Eddy's new waterproof canvas for protecting plants, &c., in pots and frames during winter, as I think it is superior to mats as a protection against frost and cold rain or snow? I used it here last winter for covering Pine pits, and found it excellent material, and after using it for six months it is almost as good as when first put on the pit, which is a great thing in its favour, for I believe it will last three times as long as the best Russian mats, and the cost is very little more than the mats would be to cover the same space. It can be had any width to cover ordinary pits. It has brass eyelet holes fitted in the borders to prevent its being blown off by the wind. It should be had a little wider than the pit, so that the sides may lap over the back and front of the pits, as by so doing it keeps the inmates much warmer, and is less liable to blow off. I have no doubt Messrs. Eddy, the net manufacturers of Fortleven, would supply estimates and all particulars to any one that might like to try the new covering. I feel sure whoever may do so will be pleased with the results. *J. Budd, Lackerby Hall Gardens.*

Bouvardia Humboldtii corymbiflora.—The most compact bushes that I have seen of this sweet-scented white flowering plant were in the gardens at Clarendon Park, near Salisbury, a short time since. The plants were planted out in good soil in an open space in the kitchen garden with several other early autumn and winter flowering plants, towards the end of May, and were afterwards attended to in the way of watering and pinching off the shoots, with the result that sturdily grown and compact plants were secured. At the time I saw them they had just been potted up, and stood under a temporary shading, and were covered with their beautiful Stephanotis-like flowers, which filled the evening air with a delicious perfume. Mr. Varden, head gardener to Sir F. H. Bathurst, grows a goodly number of these easily managed plants, which he finds of great service for cut flowers adapted for all purposes. *H. W. W.*

Wasps.—Judging by the exceeding plague of wasps which trouble Mr. Fish so exceedingly, and with such remarkable singularity, this season, it would seem as if East Anglia were suffering some sort of insect affliction for special sins. It was very odd that being in a kitchen garden in Bucks, and right in the midst of literally thousands of acres of woodland, one morning lately, I should have remarked to a friend on the evident absence of wasps in such a district this season as afforded in splendid crops of Golden Drop Plums, ripe and luscious, yet hanging unprotected on wall trees, and also of Marie Louise Pears the same, and yet not a wasp to be seen. An exceedingly interesting query is thus presented for explanation by our entomologists, Why should wasps be so singularly scarce in the southern and warmer districts, and yet be so abundant in the cooler regions of East Anglia? I hope not only Mr. Fish but all gardeners of that unfortunate district are doing their best to destroy the nests, as, combined with the scarcity of these pests found elsewhere, something may be done to render them generally scarce for several years to come. *A. D.* [To another part of Middlesex to that in which our correspondent resides there has been no lack of wasps. *Ed.*]

Veitch's New Pea, Prodigy, and Others.—Several correspondents have given their opinion of this Pea, but not a favourable one. As I purchased it in quantity from Messrs. Veitch I wish to state how it has answered here. I was certainly disappointed with it to a certain extent, but believe it to be partly due to a bad season, as Peas in general were not a satisfactory crop in this neighbourhood after the first crops were gathered, mildew having been prevalent. I

FIG. 101.—*TSUGA BRUNONIANA*: HIMALAYAN HEMLOCK SPRUCE, (SEE P. 500.)

Japanese Spruce, but I think it unfortunate that he should compare it with a kind from another country, which it in nowise resembles, and I must demur to his expression that it is "a much prettier Spruce Fir than *Picea Parryana glauca* (*Picea pungens*), inasmuch as a Fir that is only silvery on one (the under) side would not in the eyes of many persons look prettier than a Fir that is

for want of water, but this suits the Japanese Coniferæ." From this I suppose he is speaking of a heavy, retentive soil, whilst here, on a light sandy loan, I find the Japanese Coniferæ revel in a wet season. This, as far as I remember, accords with the description of the abundant rains, or, rather, continuous drippings, spoken of by Miss Bird in the *Narrative of a Visit to Japan*. *J. S. G., York.*

think Prodigy is not a strong growing kind, and when the crop was in full bloom on a dry soil, and with a scorching sun (and no means of watering), most of the blooms fell off without setting; but after a nice rain made a second bloom, from which I had some nice gatherings for some time after. In a good season I have no doubt it will be much better, and hope to try it again; it has two points which should recommend it—looking a nice green colour, and good for table. I exhibited a beautiful dish of Prodigy, amongst other kinds, at a local show in August, where none were named—it was not noticed by the judges; the first honours were given to a sort said to be Telephone, but nothing like the Telephone I have seen before, and which I have grown several times, but shall not do again. I am much more disappointed with Eckford's Duke of Cornwall, sent out by Mr. Ball. After such high recommendation, and high price too—2s. 6d. per quarter pint—one expects to get something good for the money; it is also a mixed sort. I cannot see any improvement on many older kinds, and in my opinion it is certainly not equal to some such as Veitch's Perfection, Ne Plus Ultra, and the old Knight's Wrinkled Marrow, and others; but some of these cannot be had now, as there are so many so called new kinds in the market, and gardeners are driven to search for new seeds, as they are not to be depended on from other sources. I am beginning to think raising new Peas and new kinds of Potatoes must be a very profitable business, and after so much disappointment shall now keep to older varieties principally till I see something worth having and growing. *W. Divers, Kettle Hall, October 8.*

Carnivorous Nepenthes.—It has been observed that the flowers of the Nepenthes Hookeri attract and catch the large beetles, and that even those with wings have no power of getting up. My attention was attracted by the noise of their laws searching on the sides of the cup of the flower. *Theo. Christy, Sydenham.* [Pitchers, not flowers, are probably meant by our correspondent. ED.]

Amasonia punicea.—This introduction from British Guiana fits fair to be a most valuable addition to our stove plants, and will, without doubt, be extensively cultivated when better known. Its inflorescence is most brilliant, the contrast between the vermilion-crimson lacinia and creamy-white flowers is very effective. As a decorative plant it will prove to be a most distinct and useful subject. *Jas. Huxton.*

Grafted Grapes.—Under the above heading, in your last issue, p. 470, your correspondent, "V. S.," advises "J. S." to graft his Golden Queen Vine with Black Alicante or Gros Maroc. I beg to say that during my experience, which extends over thirty years, I have never been able to produce satisfactory Black Grapes of any kind when worked up on a white variety, neither have I seen a good coloured sample result from such unions. It would be of interest if some of your experienced Grape growers would furnish their experience on this subject. *T. L., Oakley Court, Wincobur.*

Rhus radicans; Toxicodendron.—I enclose leaves of *Rhus radicans*; even the very wet weather we are having does not dim the singular beauty and brilliancy of its scarlet and yellow autumn colouring, if the plant be placed in a somewhat sunny position. It seems to be grown in various parts of the country as *Amelanchier japonica*. The plant is cultivated in some nurseries under this name, but the error should be corrected or the consequences may be serious. [It] is and sometimes as a shrub, not as a climbing plant; against a wall, however, it develops Ivy-like roots, and climbs well. The following account of its poisonous qualities is given by Professor Kalm, in his *Travels in North America*; but as yet we have found no ill effects from growing it against the house, and using its beautiful autumn leaves for indoor decoration. "These leaves have no smell, but the leaf-stalk has a very strong and disagreeable taste. Possibly the poisonous qualities may be lessened when the leaves change colour or from difference of climate. Professor Kalm says:—"When the stem is cut it emits a pale brown sap of a disagreeable scent. This sap is so sharp that the letters and character made upon linen with it cannot be got out again, but grow blacker the more the cloth is washed. Boys commonly marked their names on their linen with this juice. If you write with it on paper, the letters never go out, but grow blacker from time to time. This species of Sumach has the same noxious qualities as the poisonous Sumach or Poison-tree, which I have above described, being poisonous to some people though not to every one. Therefore, all that has been said of the Poison-tree is likewise applicable to this, excepting that the former has the stronger poison. However, I have seen people who have been as much swelled from the noxious exhalations of the latter as they could have been from those of the former. I likewise know that of two sisters, the one could manage the tree without

being affected by its venom, though the other immediately felt it as soon as the exhalations of the tree came near her, or whenever she came a yard or two near the tree, and even when she stood in the way of the wind which blew directly from the shrub. But upon me this species of Sumach has never exerted its evil power, though I made about a hundred experiments upon myself with the greatest success, and the juice once squirted into my eye without doing me any harm. "In another person's hand, which I had covered very thick with the tree, in a few hours after became as hard as a piece of tanned leather, and peeled off on the following days as if little scales fell from it." (Vol. i., p. 140.) From this account the plant appears to fully deserve its American name of "Poison Ivy." Mongredien omits it in his *Trees and Shrubs for English Plantations*, because it is so poisonous; Loudon says of it and of *Toxicodendron* of which it is a variety, "The terrible effects of their poison are frequent and well authenticated;" and Mr. Wallace says that *R. venenata* is a still more poisonous species, the touch and smell of which make many people ill. It would be interesting to know whether any baneful effects from *R. radicans* have been noticed in this country. It will certainly be a loss to gardens if this beautiful plant is found to be a dangerous one to cultivate in them. *C. M. Owen.* [It is a dangerous acrid poison; botanists using their hats instead of a vasculum, should be prepared for the consequences. ED.]

A Good Cabbage.—Mr. Frost is rather proud of the capital strain of Cabbage which he has at Dropmore, and with good reason, for it is remarkably dwarf, even, and turns in handsome, conical, fair-sized, hearts early. It is distinctive also, for the leafage is of a rich glaucous green, lacking that pale or silvery tint seen on so many Cabbages when full grown. Whether this admirable garden kind has been discovered or put into commerce recently under some other name or not, it is known at Dropmore, where it has been grown for many years, as Briginshaw's Cabbage, and also as some one's Favourite. I venture to think that, whatsoever its name, it is one of the best and most distinctive kinds we have. The breaths at Dropmore were planted in rows at about 16 inches apart. There were three breaths, the latest having just been planted for spring cutting. *A. D.*

Reports of Societies.

ROYAL HORTICULTURAL :

October 12 and 13.

A show of hardy fruits, remarkable for the number and excellence of the exhibits generally, took place on the above dates. The number of exhibitors was considerably in excess of the space available in the conservatory, and but little else but the fruit could be accommodated in any part.

The special prizes offered by Messrs. Carter & Co., Ilthorn, and Messrs. Sutton & Sons, Reading, resulted in some capital kitchen garden produce of diverse kinds being brought together, especially good being the small collections of vegetables shown in response to the offer of the last-named firm.

APPLES.

Taking the fruit shown in the order of the prize list, we find Apples occupying the first place, and with collections not to exceed fifty varieties, not less than six fruits of each variety (this latter condition concerning the number of fruits to a dish held good in all the Apple classes). Here Messrs. G. Bunyard & Co., Aylesbury, Kent, secured the highest honours among eight competitors with a very creditable and handsome collection. The individual fruits were clean, large, and of good finish. Many of the leading varieties were exhibited, the best shown being Warner's King, Red Hawthorn, Scholmaster, very fine specimens of Cellini Pippin, Grenadier, Cox's Orange, Stirling Castle, Cox's Pomona, Tower of Glamis, The Queen and Peasgood's Nonsuch, both of which were represented by very handsome fruit; Eckinville Pippin, Gloria Mundi, and Prince Albert, see Mr. G. Scater, Devon Nurseries, Heavitree, Exeter, was a worthy 2d, following closely on the first lot, and showing that Devonshire is not far behind Kent for fruit. He had few specimens of the following in his collection:—Peasgood's Nonsuch, Tom Put, Lady Hamilton, Tower of Glamis, Cat's Head, Hollow Core, Golden Noble, Blenheim Orange, Allriston, Warner's King, and York-shire Beauty. The fruits were not of such high colour as Messrs. Bunyard's. Mr. J. Watkins was 3d, with a collection of fine fruit, consisting among which were Cat's Head, Worcester Pearmain, Lord Shaftesbury, Yorkshire Beauty, Warner's King, Gloria Mundi, Winter Hawthorn, Cellini, Transparent Codlin, Custard, and Peasgood's Nonsuch.

Mr. D. C. Powell was 2d in the class of dessert Apples, and Mr. McKenzie, Linton Gardens, Maidstone, was awarded the 1st prize for a keen competition, and had as his best fruits, Emporer

Alexander, Lodding Seedling, Gloria Mundi, Peasgood's Nonsuch, Frogmore Prolific, Warner's King. The fruits here were very large, good, and decidedly handsome—a fine lot altogether. Mr. T. Turton, gr. to J. Hargreaves, Esq., of Reading, came 2d, with good Colossal Prince of Wales, and being followed by Mr. C. Ross, gr. to G. B. Eyre, Esq., Welford Park, Newbury. This was also a good collection, and included Grand Duke Constantine, Blenheim Orange, and Mère de Ménage.

Then came a class for six culinary Apples, which brought forth a splendid show of fruit in this class, the best collection being that of Mr. A. Smith, gr. to W. K. Sewell, Esq., Warren Hill, Loughton, Essex. We noticed in this lot good samples of Emperor Alexander, which, however, was not so highly coloured as usual; Gloria Mundi, Peasgood's Nonsuch, and Eckinville Pippin. Mr. Threadgold, gr. to R. Norton, Esq., Downs House, Yalding, was 2d, and a very near one too. His best fruits were: Emperor Alexander, Striped Bounfin, Lord Derby, Gloria Mundi, and Stirling Castle. The 3d prize was awarded to Mr. H. Miller, gr. Northdown, and had as his best lot, good examples of Frogmore Prolific, Stirling Castle, and Peasgood's Nonsuch.

Now followed two classes for dessert Apples, corresponding to the foregoing for culinary. In the first of these, that for twelve varieties, there were eleven exhibitors. Mr. C. Ross staged a most handsome lot in this collection, which was a good representative one, the best fruits shown were Grävenstein, Cornish Aromatic, a seedling from Golden Reinette called Lady A. F. Eyre, Worcester Pearmain, Baumann's Keimete, Blenheim Orange, and Exotic. Mr. J. McKenzie was 2d, with also a good lot, in which were Worcester Pearmain, Melon Apple, Yellow Ingestre, Ribston Pippin, and Mabbot's Pearmain. The 3d prize lot came from Mr. C. Scater; the best fruits were King of the Pippins, Irishshire Queen, and Grange Pippin.

In the class for six varieties there were the greatest number of exhibitors for the collections, Mr. C. J. Goldsmith, gr. to C. A. Hoare, Esq., Kelsey Manor, Beckenham, having the premier collection among nineteen; his finest fruits were Worcester Pearmain, Fear's Apple, King of the Ribston Pippin, Mr. G. Scater, W. Jacob, Pound Street, Petworth, and Mr. H. Virgo, Walton-in-Gordano, Somerset, were respectively 2d and 3d. The collections shown by these two exhibitors were almost identical with the 1st prize lot.

There were also twenty-one dishes of a very great each, and there brought in many instances for great competition, as many as twenty-nine entries being sometimes in one class. In each of these classes each exhibitor had to show six fruits of the one variety, and in many cases magnificent fruits were shown.

At Blenheim Orange there were twenty-four dishes shown, all fine samples. The premier award was given to Mr. S. Haines, Colehill House Gardens, Highworth. This exhibitor's fruits were of splendid quality, clean, and large. Mr. W. Jacob, and Mr. A. Evans, Lytch Hill, Haslemere, were 2d and 3d, also with good fruits.

Cox's Orange Pippin.—In an extensive competition, Mr. T. Bailey, gr. to F. T. Drake, Esq., Shardloe, Anerham, had the finest dish, being closely followed by Messrs. G. Bunyard & Co., and Mr. S. H. Godwin, Highworth, Kent. Prizes were awarded in the order of the names. It is hardly necessary to state that the dishes were creditable examples in that it is known that there were twenty-nine competitors.

Ribston Pippin.—Mr. H. Folkes, Great Graddeaden, Hert's, was 1st here, and deservedly so; the 2d and 3d prizes were respectively secured by Mr. G. Scater and Mr. R. Silk, Whiteness Gardens, Margate.

King of the Pippins.—The prizes for these were keenly contested for, there being twenty-eight dishes of the fruit shown. A dish of splendid quality from Mr. G. Thompson, Crosby Hill Gardens, Hoamlow, was placed 1st; Mr. C. Davies, Mote Park Gardens, Maidstone, secured the 2d place; and Mr. E. Chadwick, Hanger Hill Gardens, Ealing, was 3d. All these lots were of very good quality, and the fruits clean.

Golden Noble Seedling.—This was the best dish being that of Mr. W. Jones, Wellingborough Bridge, Carlishton. These fruits were very fine. Good samples also were those of the 2d and 3d lots, from Mr. D. C. Powell, Powderham Castle Gardens, Exeter; and Mr. E. Chadwick.

Mère de Ménage there was not great competition, but Mr. C. Ross' fruits, which were given the 1st place, were very good samples; Mr. G. H. Richards was a close 2d, and Mr. D. C. Powell 3d.

Lane's Prince of Warts.—Mr. Ross also secured 1st for this variety, and Messrs. Geo. Bunyard & Co., and Mr. T. Bailey were 2d and 3d.

Golden Noble.—Mr. D. C. Powell, whose fruits it would be difficult to beat, justly received the 1st prize for Golden Noble; he was closely followed, however, by Mr. G. Eaton, Cobbe's, Srevoaks; the 3d prize lot came from Mr. Scater.

Warner's King was best shown by Mr. T. Turton, who was awarded the 1st prize in a fairly large and good competition, for very good specimens; and Messrs. G. Bunyard & Co. and Mr. A. Eaton, Ipswich, were respectively 2d and 3d. All staged good, large, and clean fruits.

Gloria Mundi.—Here Mr. Threadgold carried off the premier award with fruits which deserved that recognition. Mr. D. C. Powell was a good 2d, and Messrs. G. Bunyard & Co., 3d.

Peasgood's Nonsuch.—The ten dishes exhibited in this class were all of fine quality, and made a good display, as this variety always does. The prize lots ran very closely, the best being from Mr. W. Edwards, Withington; Mr. T. Turton was 2d, and Mr. W. H. Bannister, Cote House Gardens, Bristol.

highest at Cambridge 68°.6, at Blackheath 66°.5, and at Bristol 66°.1; and lowest at Sunderland 57°, at Newcastle 59°, and at Bradford 60°.9. The general mean was 63°.2.

The mean of the seven low night temperatures was highest at Brighton, 54°.4, at Truro 53°.7, at Plymouth 52°.7, and was lowest at Cambridge, Wolverhampton, and Hull, 49°.2. The general mean was 51°.4. The mean daily range was greatest at Cambridge, 19°.5, at Blackheath 15°.5, and at Wolverhampton 14°.1; least at Sunderland, 6°.7, at Newcastle 7°.5, and at Bradford, 9°.5. The general mean was 11°.8.

The mean temperature was highest at Brighton, 58°.3, at Truro and Bristol, 58°.2; and was lowest at Sunderland, 52°.5; and at Hull and Newcastle 51°.1. The general mean was 56°.2.

Rain.—The largest falls were 1.82 inch at Sheffield, 1.39 inch at Bradford, and 1.23 inch at Brighton; the smallest falls were 0.07 inch at Cambridge, 0.50 inch at Blackheath, and 0.57 inch at Wolverhampton and Sunderland. The general mean fall 0.87 inch.

SCOTLAND: Temperature.—During the week ending October 9, the highest temperature was 64° at Perth; the highest at Aberdeen was 59°.5. The general mean was 62°.

The lowest temperature in the week was 39°.2 at Edinburgh; the lowest at Aberdeen was 46°.8. The general mean was 42°.9.

The mean temperature was highest at Paisley 56°; and lowest at Dundee and Aberdeen 53°.3. The general mean was 54°.2.

Rain.—The largest fall was 1.19 inch at Edinburgh, the smallest fall was 0.38 inch at Aberdeen. The general mean fall was 0.68 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, October 11, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W. 1.—The weather was generally fair at the commencement of the period, but soon became dull and unsettled, with frequent falls of rain. In many parts of the kingdom thunderstorms have occurred, that experienced over the N. of England, and S. of Scotland on the 6th being unusually severe.

Temperature has continued above the mean in all districts, the excess ranging from 2° in Ireland, the S.W. of England, and the Channel Islands, to 4° in Scotland and over central, "E," and "N.W." England, and to 5° in "England, S." The absolute maxima, which were recorded on the 5th, were again very high for the season, varying from 64° in England N.E., and from between 66° and 68° in Ireland, Scotland, and the Channel Islands, to 77° in the "Midland Counties," 75° in "England, S.," and 80° in "England, E." The lowest of the minima, which were generally registered either on the 10th or 11th, varied between 35° over Ireland and the Midland Counties, and 44° in "England, S." while in the Channel Islands the lowest reading was 50°.

Rainfall has been less than the mean in the extreme "N." and "N.E." districts, but more in all other parts of the kingdom.

Bright Sunshine shows a very general decrease, the percentages of the possible amount of duration ranging from 11 to 25 in Ireland, from 20 to 23 in Scotland, and from 20 to 35 in England; in the "Channel Islands" the percentage was 41.

Depressions observed.—During the greater part of this period two areas of high pressure were shown,—one over Scandinavia, and the other over Spain. Under these conditions several low pressure systems were formed in the intervening region, causing the direction of the wind on our coasts to be rather variable, but chiefly south-easterly. On the 9th, however, a deep depression moved northward along our western coasts, bringing southerly and south-westerly gales or strong winds to all our western straits. At the end of the period the high pressure in Scandinavia had disappeared, and another depression was travelling northwards or north-easterly to the north-westward of Scotland, with increasing southerly to south-westerly winds at all our western and northern straits.

Obituary.

THE death, under painful circumstances, of Mr. WILLIAM FORSYTH, for many years gardener at Gunnersbury Park, is announced. Mr. Forsyth died on the 5th inst., it is believed by suicide. He was in his 74th year.

Answers to Correspondents.

* * OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that our Registered Telegraphic Address is "GARDENERS' CHRONICLE, LONDON," and that the name in our letters to this address will reach the Editor or the Publisher without other address being needed.

ARDARROCH: P. B. H. It will appear, accompanied by a plate illustrating, on November 13 next.

BULBS DISEASED: C. E. G. Some of these are quite dead and brown with, so cannot possibly sprout. Decayed bulbs will not infect sound ones when planted, if the diseased or dead bulbs do not come into contact with them, the soil being replaced by fresh.

DOUBLE AFRICAN TUBEROSES: R. F. These will dry if you place them under Vines started after Christmas. You may pot them up in batches, so as to secure a succession of bloom. The plants do best plunged in a mild bottom-heat, in a day temperature, at first, of 58° to 60°, and the plants ought to be kept near the glass, otherwise foliage and flower-stalk lengthen greatly.

FERNS DISFIGURED: A. G. Impure gas is probably at the root of the mischief.

FIGS: W. S. Male flowers are borne in the same Fig with the female, but generally speaking, and subject to exception, the male flowers are not perfect. In consequence the male Fig, "Cappring," was used in olden times to ensure fertilisation. Insects also would carry the pollen from one plant to another. You will find a summary of our knowledge on this question in the *Gardeners' Chronicle* for February 27, 1886.

FUNGUS AT FOOT OF PINASTER: H. G. R. This handsome fungus is *Sparassis crispa*, one of the edible species, and considered very good by those who like it! W. G. S.

GOLDEN MOHUR: H. I. We do not know what is meant by "Golden Mohur" seed, unless it is the seed of a small lily-like flower, with variegated rays, variously spelt Mohwa, Moba, Mowa, Mohra, or Mahwa. Perhaps our correspondent will send us a few seeds, by which means we may be able to identify them.

GRAPE MRS. PEARSON: J. M. No useful purpose can be served by following up the subject.

INSECTS: W. H. R. The large whitish blotches on the Oak leaves are caused by the minute subcutaneous larva of a minute moth (*Tischeria complanella*) which cut the parenchyma of the leaves, remaining through the winter within the mine thus formed, changing to chrysalids in the following spring, the moths appearing in June. I. O. W.

NAMES OF FRUIT: W. DoLl, 1, Beurré Hardy; 2, Comte de Lamé; 3, Passe Colmar; 4, not recognised; 5, Hughes' Victoria; 6, Easter Beurré; 7, Winter Nelis;—9, *Bixis*; 10, Doyenné Comice; 2, Beurré Superfin; 3, Duchesse d'Angoulême; 4, Zéphirin Grelais; 5, Nouvelle Fulvie; 6, Louise Bonne de Jersey;—W. E. E. Large Pear Williams' Bon Chrétien, small do, Marie Louise—G. J. B., 1, Beurré Dnel; 2, Péché; 3, not recognised; 4, Autumn Bergamot;—Miss P., 1, Napoleon; 2, Fondante d'Automne.

NAMES OF PLANTS: A. Young. *Colutea arborescens*, *Crataegus lancaefolia*;—M. P., *Clematis corallifera*;—Caxa, 1, *Cupressus Lawsoniana*; 3, *Chamaecyparis sphaeroides*; the others next week.—T. R. Ingram, 3, *Leucothoe axillaris*; 4, *Escallonia montensis*; 5, *Aster ericoides*; 10, *Hydrangea hortensis* var.; 11, *Hypericum patulum*.—See flowering specimens of 1, *Cratogeomys japonica*; 2, *Glyptostrobos pentdialis*; 3, *Taxodium distichum*; 4, *Empetrum Weinanmannianum*; 5, *Glyptostrobos heterophyllum*; 6, *Retrospora squarrosa*.—H. L., *Maclura antantica*;—Paragon. *Cebalanthus lendigera*.

ODONTOGLOSSUM CRISPUM: R. M. The peculiarity of your flower arises from the union of two flowers, each with its separate column and lip.

PEACH-HOUSE TO BE PLANTED WITH MIXED VINES: Hambro. You might plant Buckland Sweetwater, &c., first. Seedling any of the Frontignans, if you like them; Black—Champion and Golden Hamburg, Royal Muscadine, Duke of Buccleuch, and Trentham Black. If you graft Black Hamburg on Barbarossa you will gain size at the expense of flavour.

PLANT PROPAGATION. HARD-WOODED ERICAS, NEW HOLLAND PLANTS: A. S. B. There is no separate work on this subject in the English language.

RED OR ORANGE RUST ON ROSES: J. A. E. There is no known cure for this disease, but there is a preventative. The Roses should be lifted and replanted

every autumn, giving at the same time plenty of manure, and stirring the soil as deeply as it will allow.

SEEDLING CARNATION: T. It has no value as a border plant, there are so many better ones.

* * All communications intended for publication should be addressed to the "Editor." Such communications should be written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Swan;—D. T. F., J. H., W. H., H. J., F., A., D., W., C., M.,—Pyrus;—N. E. B., C. Roach Smith;—D. M., Kew (many thanks);—W. W. X.,—Professor Bayley Balfour;—Professor Marshall Ward.

Markets.

COVENT GARDEN, October 14

[The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal growers, who revise the list weekly, and are responsible for the quotations. It must be remembered that the figures are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted in our catalogues for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Ed.]

TRADE quiet; no alterations to quote. *James Webster, Wholesale Apple Market.*

FRUIT.—AVERAGE WHOLESALE PRICES.			
Apples, ½ sieve .. 1 6-3 6	Pears, per dozen .. 3 0-4 0	Pears, per dozen .. 1 0-1 6	Fine apples, Eng. lb., 2 0-4 0
Figs, per dozen .. 0 9-0 10	St. Michael, each 6 8-8 0	Potatoes, per bush .. 4 0-6 0	Plums, ½ sieve .. 0 9-0 2
Grapes, per lb. .. 10 6-2 0	Lemons, per case .. 13 0-3 0	Melons, each .. 1 0-2 0	

VEGETABLES.—AVERAGE WHOLESALE PRICES.			
Artichokes, per doz. .. 4 0-5 0	Aubergines, each .. 0 2-0 2	Beans, kidney, lb. .. 0 7-0 8	Beet, red, per dozen .. 0 10-0 12
Brussels Sprouts, lb. .. 4 0-5 0	Cauliflowers, per doz. .. 3 0-4 0	Celery, per bundle .. 1 6-2 0	Cucumbers, each .. 0 6-0 8
Endive, per dozen .. 1 0-1 6	Herbs, per bunch .. 0 4-0 5	Lettuce, per bunch .. 0 3-0 4	Lettuce, per dozen .. 1 0-1 6

POTATOES: Kent Regents, 6oz. to 8oz.; Schoolmasters, 7oz.; Beauty of Hebron, 8oz. to 9oz. per bush.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.			
Aralia Sieboldi, per dozen .. 6 0-8 0	Asters, per dozen .. 2 0-3 0	Chrysanth., per doz. .. 4 0-12 0	Dracena terminalis, per dozen .. 3 0-6 0
Erica hyemalis, doz. .. 12 0-18 0	Myrica, per dozen .. 6 0-12 0	Heliotropes, 12 spr. .. 0 1-0 2	Euonymus, in var., per dozen .. 6 0-18 0

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.			
Arum Lilies, 12 blms. .. 4 0-6 0	Asters, 12 sprays .. 4 0-6 0	Adonis, 12 bunches .. 0 9-1 0	Camellias, 12 bunches .. 1 0-3 0
Carnations, 12 blms. .. 0 3-0 6	Chrysanth., 12 blms. .. 0 1-0 2	Dahlia, 12 bunches .. 3 0-4 0	Heliotropes, 12 bunches .. 1 0-2 0
Eucharis, per dozen .. 4 0-6 0	Fragranza-Nor., 12 blms. .. 2 0-4 0	Mossy, 12 bunches .. 2 0-4 0	Gardenias, 12 bunches .. 2 0-4 0
Gladioli, 12 sprays .. 0 2-0 4	Heliotropes, 12 spr. .. 0 1-0 2	Jasmine, white, bunch .. 0 6-0 7	Lapageria, 12 bl. .. 0 2-0 3

SEEDS

LONDON: Oct. 13.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C., report to-day's market inactive, business being confined to very narrow limits. For the moment the consumptive demand is almost nil, whilst there is just now a complete absence of speculation also. Winter Tares move off slowly at the remarkably low rates previously noted. Some choice new American red Clover seed is just coming to hand. For blue boiling Peas and Haricot Beans the inquiry is meagre; the colder weather will greatly enhance the demand. There is no important change in the trade for Hemp and Canary seeds. Rather more money is asked for feeding Linned.

CORN.

MARK LANE: Oct. 11.—Only a limited business in Wheat was concluded, and on the week prices are barely steady. Fine malting Barley was in steady request, at firmer prices, but ordinary and grinding descriptions were dull and in favour of buyers. Beans met less demand, and were 6d. lower on the week, and Peas from the same cause, with larger arrivals, were 1s. lower. Maize sold slowly without appreciable change. Oats, of which arrivals have been good, met a fair demand at generally firm rates.

Oct. 13.—The Wheat trade continued dull, but with very little change in prices. Flour was an equally slack trade, with prices nominally unaltered. Grinding Barley met very little inquiry, but has not been so good. Good malting qualities continued firm. Peas and Beans sold slowly at Monday's rates. Maize was quiet, but steady in value. Oats showed a further hardening tendency, with a fair demand.

Average prices of corn for the week ending October 9: —Wheat, 30s.; Barley, 25s.; Oats, 17s. 8d. For the corresponding week last year—Wheat, 30s. 7d.; Barley, 30s. 11d.; Oats, 18s. 8d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Oct. 13.—Plentiful supplies and trade good at slightly advanced rates. Quotations: Damsons, 2s. 6d. to 4s. 6d. per bushel; Plums, 2s. to 5s. do.; Apples, 2s. 6d. to 4s. do.; Pears, 3s. to 5s. 6d. do.; Cauliflowers, 2s. 6d. to 8s. per tully; Cabbages, 2s. 6d. to 4s. 6d. do.; Vegetable Marrows, 2s. to 4s. do.; Scarlet Beans, 1s. to 2s. per sieve; Beetroots, 1s. 6d. to 2s. per dozen bunches; Turnips, 2s. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. do.; Onions, 3s. 6d. to 4s. per cwt.; Carrots, 2s. to 3s. per ton; Mangel, 17s. 6d. to 20s. do.

STRATFORD: Oct. 12.—The market has been well supplied, and a fair trade has been done at the under-mentioned prices:—Cabbages, 2s. 6d. to 3s. 6d. per tully; Savoy, 4s. to 5s. do.; Cauliflowers, 1s. to 1s. 6d. per dozen; Turnips, 1s. 6d. to 2s. per dozen bunches; Carrots, household, 3s. to 4s. per ton; Mangels, 15s. to 17s. do.; Swedes, 2s. to 2s. 6d. do.; Onions, 8s. do.; do. pickle, 3s. 6d. to 4s. per sack; Watercress, 6d. per dozen; Apples, 3s. to 6s. per bushel; Pears, 3s. to 4s. 6d. do.; Plums, 1s. to 2s. per half sieve; Damsons, 1s. 6d. to 2s. do.; Celery, 8s. to 9s. per roll.

POTATOS.

ROUGH AND SPITALFIELDS: Oct. 12.—There were full supplies of indifferent quality, which were very dull of sale. Best qualities at moderate prices, and well supported in value. Quotations:—Kent Regents, 50s. to 60s.; Essex, 50s. to 80s.; Early Rose, 60s. to 70s.; Magnum Bonum, 50s. to 80s.; and Hebrons, 60s. to 95s. per ton.

COLUMBIA (East London): Oct. 13.—Quotations:—York and Lincoln Magnums, 50s. to 65s.; Regents, 60s. to 70s.; Victorias, 60s. to 70s.; Kent and Surrey Regents, 70s. to 80s.; Magnum Bonum, 50s. to 70s.; Cambridgeshire Regents, 60s. to 70s. per ton.

STRATFORD: Oct. 12.—Quotations:—Magnum, 60s. to 65s.; Regents, 60s. to 70s.; and Blackland, 50s. to 60s. per ton.

Imports.—The imports into London last week consisted of 28 sacks from Boulogne, 671 bags from Harlingen, 9 from Rotterdam, 54 tons from Ruscoff, and 409 bags from Hamburg.

HAY.

WHITECHAPEL, Oct. 12.—The Clover trade was very depressed, with continued low prices. But hay meets a fair inquiry. Quotations:—Clover, prime, 88s. to 104s.; inferior, 70s. to 84s.; hay, prime, 70s. to 60s.; inferior, 30s. to 65s.; and straw, 27s. to 38s. per load.

Oct. 14.—There was a moderate supply on offer. The trade was very dull at late rates.

CUMBERLAND (Regent's Park): Oct. 12.—A large supply was on offer, but very dull trade, greatly influenced by the weather. Quotations:—Clover, best, 84s. to 100s.; second, 70s. to 80s.; hay, best, 80s. to 85s.; second, 60s. to 75s.; and straw, 28s. to 36s. per load.

STRATFORD: Oct. 12.—Quotations: Hay, 80s. to 84s.; Clover, 60s. to 65s.; and straw, 30s. to 35s. per load.

Government Stock.—Consols closed on Monday at the prices of the preceding Saturday, viz. 100½ for delivery, and 101 to 101½ for the account. The final quotations of Tuesday and Wednesday were 100½ for delivery, and 100½ to 100½ for the account. The closing record on Thursday was 100½ to 100½ for delivery, and 100½ to 100½ for the account.

THE "RAPID" PROPAGATOR

Is the best and cheapest for striking cuttings, raising seeds, or propagating anything requiring a hot-heat. Strongly made. Price includes Lamp and Registered Central Heating Kettle, as engraving. Cost of working reduced to a minimum, as all heat generated is utilised. At this season no garden should be without one.

No. 1, 3 feet 6 inches high by 2 feet 6 inches long by 1 foot to inches wide. £1 17s. 6d.

No. 2, 3 feet 6 inches high by 2 feet long by 2 feet wide. £2 10s.
Packing, 6s.

All orders executed in retention.
Carriage paid to any Railway Station in England and Wales; also to Edinburgh, Glasgow, Dublin and Belfast.
Illustrated Catalogue, post-free, two penny stamps.
See Advertisement alternate weeks.

THE LOUGHBROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stopcock, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside, so that the whole of the heat from the Boiler itself is utilised. It burns over twelve hours without attention, at a nominal cost.

Price, as engraving, with Boiler, open feed syphon, 12 feet of 1/2 inch hot-water pipe, and patent joints complete, 44 ss. Delivered free to any Railway Station in England and Wales, at a nominal cost. Cost of apparatus complete for Greenhouses as below, delivered free with pipes cut and fitted ready for fixing:—
10 x 6 feet .. 24 14 0 | 20 x 10 feet .. 60 0 0
12 x 8 feet .. 35 11 0 | 25 x 12 feet .. 80 16 8
15 x 9 feet .. 50 10 8 | 40 x 16 feet .. 120 12 4
Proportions of prices for other sizes. Estimates free.
Illustrated LIST, with full particulars of these and every description of Fuel, Gas, and Oil Heating Stoves free.

To Florists. WANTED, a LADY, for Flower Stands in Leeds Market. Must be a good Maker of Wreaths, Bouquets, &c.—Address, with references and salary, SHAW BROTHERS, Market, Leeds.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Retard Advertisements are received without name, address, or number, or beyond the postmark on envelope by which it identifies the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their names, addresses, and also to refer to the Advertisement which they wish Reported.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILEIFF, FOREMAN, or JOURNEYMAN, and Gentlemen requiring any of the above will please send full particulars, with the best selections for the different capacities will be made.—Holloway, N.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, wishing engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

THOMAS KENNEDY AND CO. have on their Register a number of GARDENERS, FORESTERS, &c., wishing engagements, and will be pleased to furnish particulars to any one who want same.—THOMAS KENNEDY AND CO., 108, High Street, Darnley, N.B.

Gardeners Under Gardeners, Baileiffs, &c. W. M. CUTBUSH AND SON have at the present time on their Register a number of first-class Gardeners, and such as from their personal knowledge can recommend as to abilities, &c.—Ladies and Gentlemen requiring any of the above can be satisfied with the first-class men by applying to Wm Cutbush & Son, Highgate Nurseries, London, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. James's, Worcester.

To Gentlemen. MANAGER.—A GENTLEMAN intending to Invest Capital to Grow Choice Fruit, Cut Flowers, &c., extensively for Market, Advertiser, thoroughly experienced, could secure large returns upon outlay.—INVESTMENT, 15, Old Broad Street, W.C.

GARDENER (HEAD), or GENERAL MANAGER, age 22, moderate, G. H. M. McCulloch, for the last five and a half years Head Gardener at Powerscourt, is a liberty to treat with any Nobleman or Gentleman in a position of leaving a good situation on account of reductions being made.—Thoroughly practical in all its details. Has a general knowledge of Estate Management, including Farming. Holder of several Medals for Grape-growing, &c. List will be pleased to recommend him, and to whom reference is kindly allowed to be made.—G. H. McCULLOCH, Flower court Gardens, Enniskerry, Ireland.

HOLLOWAY'S PILLS.—The Great Need. The blood is the life, and on its purity depends our health, if not our existence. These Pills thoroughly cleanse this vital fluid from all contaminations, and by that strengthener and invigorator the whole system, and thereby stimulate sluggish organs, repress over-excited actions, and establish order of circulation and secretion throughout every part of the body. The balsamic nature of Holloway's Pills commends them to the favour of debilitated and nervous constitutions, which they soon reconstitute. They disengage all obstructions, both in the bowels and elsewhere, and are, of that account, much sought after for promoting regularity of action in young females and delicate persons, who are naturally weak, or who from some cause have become so.

FOSTER & PEARSON, HORTICULTURAL BUILDERS, BEESTON, NOTTS.

THE "CHILWELL NURSERIES" BOILER
REGISTERED

EXPLANATION
WATER PASSES THROUGH THE RETURN PIPE INTO THE BOX A. THENCE THROUGH PIPES BBBB TO BOX C. THENCE THROUGH PIPES DD TO BOX E THENCE THROUGH PIPES FFFF. FFF TO BOXES HH THENCE THROUGH PIPES IIII TO BOXES KK AND THENCE INTO BOX L.

THE BEST BOILER FOR GREENHOUSES.

WHAT THE NURSERYMEN SAY:—

From Messrs. J. P. PEARSON & SONS, Chilwell Nurseries, Notts.

"The 'Chilwell Boiler' has given us unqualified satisfaction from the first, being the most powerful and economical we have yet tried. The draught is so good that we can burn any kind of fuel, and get up the heat in less time than with any other boiler, while it is at the same time under perfect control."

From Mr. EDWIN COOLING, Mile Ash Nurseries, Derby.

"I am very pleased with the new Boiler. It does its work admirably, and heats the water in less time than any boiler I have ever had. Your boiler is doing the work of *ten* *others*, and doing it much better, with less than a quarter of the labour in stoking. It has been severely tested during the late hard weather, and proved

quite equal to its work. We find it easy to manage, quick in its action, and very economical."

N.B.—This is a 12-foot Boiler, heating 5100 feet of 4-inch pipe.

From Messrs. W. BARRON & SON, Elvaston Nurseries, Derby.

"The 12-foot Chilwell Nurseries Boiler is very satisfactory. It heats seven houses, containing 3000 feet of pipe, which formerly required three boilers, thus effecting a considerable saving in labour and fuel. The water heats and circulates much more quickly than from a saddle boiler, and the fire can be banked and left for hours without further attention. During the late severe weather we have never touched the fire between 10 P.M. and 6 A.M."

SPAN FRAME on Iron Standards, 6 or 8 feet wide.

ONE GOLD, THREE SILVER
MEDALS,
LIVERPOOL SHOW,
All First Prizes.

The "LIVERPOOL" BOILER.

Price LISTS on application.

BAUMFORTH'S SEEDLING RASPBERRY.

THIS new and splendid Raspberry has now so thoroughly established itself a popular favourite with the Growers for Market, the Gentlemen's table, and especially the Exhibitor, throughout the Kingdom, that it is almost superfluous now to make a repetition of its merits in detail.

I am offering Canes this season at the following reduced prices:— Planting Canes, 15s. per 100. 3s. per doz. Fruiting Canes, 22s. 6d. per 100. 4s. per doz.

EDMUND PHILIP DIXON, Nurseries—HULL and BURTON-CONSTABLE. Seed Establishment—57, QUEEN STREET, HULL.

VEITCH'S BULBS For Present Planting.

JAMES VEITCH & SONS, Royal Exotic Nursery, Chelsea, S.W.

VEITCH'S BEDDING HYACINTHS. In distinct and decided shades of colour. Specially selected varieties to flower at the same time, producing large trusses of bloom.

Table listing bulb varieties and prices: DARK BLUE, BRIGHT BLUE, CRIMSON, BRIGHT RED, PURE WHITE, WHITE, tinged rose.

Table listing mixed hyacinths: BLUE, all shades; RED, all shades; WHITE, all shades; MIXED, all colours.

Table listing mixed tulips: SINGLE, finest mixed; DOUBLE, finest mixed.

Table listing Dutch crocus: LARGE GOLDEN YELLOW, LARGE BLUE, LARGE STRIPED, LARGE WHITE, MIXED, all colours.

Table listing narcissus: SINGLE DAFFODIL (Leont Lily), DOUBLE DAFFODIL, BUTTER AND EGGS NARCISSUS, PRIMROSE, PEARLES NARCISSUS, PHEASANT-EYE NARCISSUS, DOUBLE WHITE SWEET-SCENTED NARCISSUS.

For other Bulbs for Planting or Pot Culture, see CATALOGUE, forwarded Gratis and Post-free on application.

ROYAL EXOTIC NURSERY, CHELSEA, S.W.

SEEDLING BRIERS.

Any quantity of 3, 2, and 1-year old plants. NEW ROSES OF 1885-6. 15s. per dozen varieties (my selection); 30s. per 25 varieties (my selection).

THE PLANTING SEASON.

THE BEST ROSES, THE BEST CAMELLIAS, THE BEST HYACINTHS, TULIPS, &c. THE BEST EVERGREENS AND FLOWERING SHRUBS, THE BEST PARK AND ROADSIDE TREES, THE BEST FRUIT TREES AND GRAPE VINES, THE BEST SEEDS, &c.

WM. PAUL & SONS', PAUL'S NURSERIES, WALTHAM CROSS, (adjoining Waltham Cross Station, Great Eastern Railway, half an hour from London). Prices as low as possible. Inspection invited. Priced Catalogues free.

THE Gardeners' Chronicle. SATURDAY, OCTOBER 23, 1886.

AFTER THE FIGHT.

ONCE more we have fought a campaign in the wars of the Roses—once more have the combatants laid aside their weapons and are counting up their gains and losses; yet such is their eagerness for the fray that, like the old Italian mercenaries (not that they are such), this is but a short breathing space for preparation for future battles; already are they putting aside weapons that have proved worthless in past encounters—already are they looking out for fresh ones, and seeking information on all sides from those who have used them or seen them used.

I anticipated that we should have a good season, but in writing upon it beforehand I stated that so much depended on the three weeks immediately preceding the show time—that is, the latter part of the month of June and the first week of July—that it was always impossible to state what it would be likely to be. When I saw the perfectly clean state of the plants in various parts of the country, and heard the reports of many growers, all seemed favourable; but, ah! those "buts" there came in June a cheerless time, succeeded (as it was in 1885) by some very hot days in the earlier part of July, and as a consequence blooms were generally small, but the colours were good, and the flowers quite in character.

because they do not always come up to the mark, the instance of Boildieu (a Rose raised by Jules Margotin fils, and which many rosarians have thought lightly of) taking the premier prize for the best H.P. at South Kensington in the nurseryman's class may be noticed; when one recollects against what it had to contend—A. K. Williams, Marie Baumann, &c.—it evidences that the season was favourable for the lighter coloured Roses, and that flowers may come out exceptionally good now and then, although not always to be depended upon.

As usual, a good deal of interest was excited about NEW ROSES, and many were very anxious to see Her Majesty, but it was not once exhibited. I suppose that exhibitors who had it were too busy in propagating it to leave it to flower; a rude shock has been given to those who were looking to it as a grand acquisition, when they heard that after all it was a summer Rose only; should this be the case a great deal of its value will be gone. It may, however, prove like Madame Gabriel Luizet, of which I have already written, which lay under the same stigma, but has proved with me and others to be one of the best autumn blooming Roses we have. From various places, since my note on it appeared, I have had the confirmation of my statement; it did not flower from the long shoots which are thrown up from the roots and which form the "spes gregis" for the following year, but from those shoots which come from the centre of the plant after the first bloom is cut in July. With regard to new Roses generally it may be said that there has been a dearth; in fact, of those of 1835-86, there has hardly been one of which we can speak with any confidence as far as the exhibitions go.

But from other sources one has heard of one or two, though probably the verdict "they are a bad lot" may be only too true. Of those of 1881, we can say something more definite, thus Dr. Dor (Liabaud) is a fine cherry-red flower, large petalled and full, very sweet-scented, and likely to be a useful Rose. Edouard Herve (E. Verdier) is a bright light carmine Rose, full, well shaped, and apparently a first-class Rose. Madame Massicault (Schwartz), bright rosy-flesh, is, I fear, not large enough, but still it has been shown well. Mrs. George Dickson (Bennett) is pleasing in colour, but too thin to be popular. General Appert (Schwartz), velvety reddish-purple shaded black, full, and likely to be a good Rose. Madame Raoul Chandon, a good Rose of the Marie Finger type, but distinct from that variety. Victor Hugo promises to be the best of that season's flowers; it is a vigorous growing Xavier Olibo, brilliant in colour and likely to be a great favourite. Gloire Lyonnaise (Guillot) is very pretty, especially in the bud, but one has not yet discovered the yellow in it, and as to calling it a yellow hybrid perpetual it is all nonsense, it ought to be classed amongst the so-called hybrid Teas, if we are to retain that class; but it would seem to me to be much better to do away with it and class all the Roses that are now included in it under hybrid perpetuals, and leave Teas and Noisettes to themselves.

Amongst Teas, Souvenir de Gabrielle Drevet, which has been described as something between Madame de Watteville and Souvenir d'Elise, seems good, and is one of those delightfully variable Roses which give us flowers of such different characters, like Madame Lambert, from a branch of which you may cut sometimes a yellow and sometimes a red Rose. I have received from two different sources blooms of the American Rose, The Bride: this is not a seedling but a sport from that fine old Tea Rose, Catherine Mermet. One bloom was sent to me by Mr. B. R. Cant, Colchester: it is certainly white, but I suppose, owing to the cold nights we have lately experienced, the edges were tinged with pink like Marie Van Houtte: the other was a

bud from Mr. James Boyson, of Caen, and was perfectly white and very pretty, but I rather doubt if the white will be as pure as that of Niphotos; but still I think it will be a very welcome addition to our Tea Roses. The other Rose was American Beauty, also sent to me by Mr. Boyson—evidently a hybrid Tea of the Reine Marie Henriette type, but lighter in colour. I do not confess to much partiality for these flowers, and as exhibition flowers they are, I think, useless. Who ever saw a stand that was the better of any of them, and which would not have been improved by the substitution of some other variety? Of those of 1885, as I have said, little has been seen. Clara Cochet, a seedling of Lacharme's, is said to be a promising flower; and Comtesse de Frigneure, Tea, some speak highly of.

So much for the flowers, and now for a word about the exhibitors. We have seen some changes, as is always the case. We have missed from the tented field one of our very best exhibitors, Mr. Whitwell, of Darlington; and no one seems to me to have occupied so prominent a position during the past season, amongst amateurs at any rate, as in years past. The Rev. J. H. Pemberton carried off the challenge trophy a second time, but he did not continue so long in the running as last year, while amongst nurserymen the success of Mr. B. R. Cant at the earlier shows, and Messrs. Harkness & Son at the later ones, has been exceptional. One of the most interesting cases of exhibiting I know is that of a gentleman in Wales, Colonel Standish Hore, who out of a small collection of 168 plants managed to win a 1st prize for twelve hybrid perpetuals, and a 3d for six Teas, at the National Rose Society's provincial exhibition; although he had only grown Roses for two years, he managed to beat growers who had ten times the number of plants, and had been exhibitors for twenty years. This only shows what can be done, and effectually disposes of the objection that small growers have no chance. Doubtless, as a rule, the big battalions are likely to gain the day, but if small growers will be content with small things and not be over-ambitious, they can succeed; but if a grower with a small amount of plants attempts to go in for large prizes he will find that this is a case in which

"Vaulting ambition doth o'erleap itself,
And falls on t'other side."

It is well said that "little boats should keep near shore;" and I am sure that much of the disappointment experienced by many exhibitors arises from their attempting too much.

With regard to exhibitions themselves, there has been no diminution in the interest they have excited, and managers of shows have been singularly fortunate in the weather in which they have been held; it has been unusually fine, sometimes a little too hot, but never wet. The exhibitions of the National Rose Society have both been successful, the space at South Kensington being much too small for the number of blooms staged; while at Birmingham, once famous for its Rose shows, but where it was new ground to the National, there was a grand exhibition, and everything went off to the satisfaction of all.

I have already written about a few things I think might be altered for the better, and in referring to it in connection with this part of my subject, must refer to the very strange letter of "D. T. F." which appeared in the *Gardeners' Chronicle* of October 2, p. 429. I always thought the writer was a practical man, but anything more hopelessly unpractical I have not read; moreover I think he is altogether unfair to the National with regard to garden Roses, for it has for some years offered prizes for the very flowers he accuses us of neglecting, and which have been well contested; in truth, there is a great deal of

illusion on this subject. I fearlessly state that the very best Roses for garden decoration are those which are contained in our exhibition lists. And what an astounding idea is that which he puts forward—that in order to remedy the difficulty of allowing the stands of different numbers to compete for the prize for the best box in the show, it would oblige all if 72's were to compete with 72's, &c. Why, there never is but one class of 72's at a show; and it would be simply, to follow out his rule, to give an additional prize to each 1st prize stand—certainly a curious way of solving a difficulty. I should like to enter more fully into this letter, for it bristles with inconsistencies, but for the present I must pass on.

And now with regard to the last point—the Rose in the garden. I do not think I remember for years seeing such a grand autumn for blooming. At any time during the month of September it was possible to gather a quantity of good blooms, not equal to those of July, but still very handsome and sweet, while the wealth of Teas has been something wonderful; the bushes were as full of bloom as in the earlier part of the season. I have been enabled to gather such Roses as Catherine Mermet, Marie Van Houtte, Rubens, Madame Lambert, and Anna Olivier in great abundance, and while in size not so large as those in the earlier part of the season, they were in form and substance all that could be desired. One remarkable fact has been the almost total absence of aphids. I have been into many gardens, but in no part of the country have I seen it, and we know very well how much trouble this saves, and how much better plants look which have not to be syringed or treated for this pest. In many places, however, orange fungus—a most destructive pest—has made its appearance, while mildew has also been very bad; but upon the whole, a finer season for garden Roses I do not well remember; and all who love the Rose (and who does not?) have enjoyed a pleasure they will not soon forget. *Wild Rose.*

New Garden Plants.

HABENARIA MILITARIS, n. sp.

WHEN my late friend, J. von Warscewicz, paid me his first visit (it was at Berlin, at four in the morning (!), he brought his sketches of Chiriqui Orchids in colours; and when I saw what I then called Epidendrum Pseudepidendrum I felt quite amazed. Such a thing had not been seen before in Orchids. When Messrs. J. Veitch & Sons first flowered the plant (June, 1871) it excited the greatest curiosity.

And now three stands before me a second plant with the same contrast of colour—a *Habenaria*, kindly sent me by M. Regnier, horticulteur, 44, Avenue Marigny, Fontenoy sous Bois, Seine. I have it in a pot, in splendid health, with five expanded flowers. M. Regnier tells me the plant is rather small, he having seen much taller specimens. The colour is nearly bluish-grey. There are six leaves, two of which are longer than the others, all linear, the longest ones reaching a span in length by half an inch in width, equally broad in the middle. The raceme has seven flowers and buds, which, when open, measure two good inches from the top of the helmet to the apex of the spur. They are just like (excepting the spur) the flowers of a well developed *Orchis purpurea*, Huds. (fusca, Jacq.). The oblong acuminate bracts

* *Habenaria militaris*, n. sp.—Spathamata et alior: foliis linearibus acutis dimidium pollicem latis; racemo pluri-floro; bracteis inferioribus ovata pedicellata acuminatis oblongo-ligulatis acuminatis; sepalis dorsali nerviculis eua tepalis linearibus-galeatis; sepalis lateralibus oblongis acutis reflexis; labello trifido, laciniis lateralibus oblongo-trapezoides, divaricatis, lacina interna breviter unguiculata porrecta oblonga biloba, laciniis triangulari, calcaris niformi compresso acuto ovario pedicellato longiori; costelli lacinae mediana triangulari confusim, stigmatibus curvatis porrectis (b. porrectis); nuda, stipularibus, paucifolia libelli nuda pro lacina mediana angusta bene longiori. *Habenaria pusilla*, Kchb. f., Or. Bot. Hamb. 1795, p. 35. Cochinchina. H. G. Rehb. f.

are equal in length to the inferior stalked ovaries, but smaller under the uppermost ones. The dorsal sepal is cucullate navicular, the two nearly linear apiculate petals being strongly adherent to it. The lateral oblong acute sepals are reflexed and revolute. All these parts are green. The lip is trifid, the stalk is short, the lateral laciniae are oblongo-dolabriform, spreading, the anterior lacinia is transverse with two shanks of nearly similar circumerence, spreading or antrorse, smaller. The lip is quite scarlet inside, outside it looks as if the scarlet colour had been varnished with white. No English soldier can boast a jacket of a deeper scarlet than the lip of our plant. The spur is filiform, greenish-white, compressed acute, longer than the stalked ovary. The anther has two long channels for the caudicle, and the naked glandule are red. The rostellum is triangular, complicate, looking, when seen from the side, like the upper horn of an African rhinoceros. The two stigmatic processes are even more scarlet than the inner side of the lip, spread out like the bloody tongues of bloodthirsty beasts. A small apiculus stands between them.

So much for the beloved plant. The history is, that M. Godefroy Lebeuf discovered it in Cchin China. I saw his dried plant, and have careful pictures of it. It is very dwarf, has smaller leaves, a longer stalk to the narrower anterior lacinia of the lip, and shorter bracts; but there is no doubt that it is the same plant found afterwards in full development by M. Regnier. What could I do? I do not like those often naughty talks about names by people who have never given one, but who think the giving of names is the acme of science. I detect changes of names, yet it is not very agreeable to me to have called a plant "pusilla" that would appear to reach 2 feet in length. After a long consideration (I am afraid M. Regnier found it too long) I made up my mind. I venture to give a fresh name to this, a small form of which was originally discovered by M. Godefroy Lebeuf, and which has some differences from the fully developed plant. Amateurs will always consider the size, and a variety "maxima" or "pusilla" will be well weighed by those who purchase plants, whatever theoretical views may be professed in festival speeches by those who think they can educate the amateur just as they please to do. The amateur, however, is what he is.

As a species the plant may be compared best with *Habenaria crinita*, Lindl., a fine Cingalese species. Our plant has all parts of the lip shorter, and with no tails to the divisions of the lip. I have a certain hope that this military plant will be kept in gardens. *Habenaria leptoceras*, Hook., lasts a very long time, propagates freely, till the genuine man comes, who understands how to kill it by improper treatment. *H. G. Rehb. f.*

ORCHIDANTHA BORNEENSIS, *N. E. Brown.*

[A NEW GENUS OF SCITAMINEÆ.]

Considered from a botanical point of view this is one of the most interesting plants that has been introduced for some time, for although there can be no doubt whatever that it is a member of the natural order Scitamineæ, yet it is so unlike anything hitherto known in the character of its flowers, that it will probably form a distinct tribe of that order; but for the present I place it in the tribe Muscæ, in which it may find place as an anomalous genus. Gardeners probably will find less to admire in it, as unfortunately it is not so showy as it is interesting; however, it may be expected to find much favour with Orchid growers, since the flowers very much resemble those of certain Orchids, and are quite equal to many of them in beauty. Popularly speaking, it is a dwarf foliage plant, having something of the aspect of a very small *Heliconia*, with ovate-lanceolate or ovate bright green leaves, and small contracted two to three-flowered spikes of Orchid-like flowers about an inch long, arising from the base of the stems. This remarkable plant has been introduced from Borneo by the Compagnie Continentale d'Horticulture, Ghent, and the following is a full description of it:—

Plant about a foot high. Petioles erect, 4–10 inches long, embracing each other below by their sheaths, terete in the upper part, with a narrow channel down the face. The blade of the leaf is broadly ovate, or ovate-lanceolate, acuminate, 6–10 inches long and 2½–3½ inches broad, spreading, light cheerful green, penninerved, with four to seven ascending, curved primary nerves on each side the midrib, and three finer secondary nerves between each pair, with a fine and dense transverse venation between them, scarcely

visible in the living state unless held up to the light; the midrib is impressed above, prominent and rounded beneath, and the primary nerves are slightly prominent beneath. The inflorescence, which seems to be freely produced, is sessile at the base of the plant, and is about an inch long, with one to two branches clothed with ovate or oblong purplish scales enclosing one sessile flower. The three sepals are free and equal, linear-lanceolate acuminate, 1–1½ inch long, ½ inch broad, slightly spreading, pale yellowish in the basal part, dull purple in the upper part, on both sides. The lateral petals are 4 lines long and ¾ inch broad, linear, truncate with a fine bristle at the apex, and of a blackish-violet colour. The labellum is like the sepals but a little shorter, 10 lines long, linear-lanceolate acuminate, blackish-violet in colour, like the petals. The stamens are five in number, and are shorter than the petals; filaments free, 1 line long, pale yellowish-white; anthers 1½ line long, linear, two-celled, slightly obtruse, introrse, dusky on the back; pollen white. Ovary sessile, inferior, ¾ inch long, enclosed within a convolute, obtuse, reddish-brown bract, the basal part is three-celled, with numerous ovules in each cell, the upper part is solid. The style is as long as the stamens, slender, terete, and whitish in colour, terminating in a blackish-violet, three-parted, fimbriate crest, with a V-shaped stigma just below it, facing the labellum. A native of Borneo. *N. E. Brown, Herbarium, Kew.*

ORCHIDS AT ST. ALBANS.

THE interest in Messrs. F. Sander & Co.'s great establishment will soon rest in a great measure in the several large *Odontoglossum*-houses filled with many thousands of the best types of *O. Alexandræ* and its hybrids—most of which have not yet flowered in this country, but which are already sending up from the sturdy well-grown plants many thousands of spikes, sufficient being already in bloom to prove the unsurpassable excellence of the strain. At present, however, the chief display of flowers and prominent buds is given by the Mexican and Brazilian plants, each of the showiest and rarest kinds of which are represented by large numbers of healthy plants. How Orchid growing, in all its branches, is carried out here, on such a large scale and to such perfection, is only to be explained by the fact that each batch, or the set of plants of each locality, is treated by itself, and in all cases the information of the collectors as to the natural conditions in which they found them is brought to bear on the plants as nearly as their culture under glass will admit. Thus in the long Mexican corridor which connects all the houses in the one end in a like manner to that in which a similar corridor and the offices enclose the other, provision is made over the whole of the roof for suspending thousands of Mexican and Guatemalan plants requiring the greatest amount of light and air. Here large numbers of *Lælia anceps* and its now numerous new white varieties are freely sending up flowers; many scores of spikes of the large golden lipped *Oncidium tigrinum* are showily in bloom, and delightfully fragrant, their graceful sprays also being made to decorate the ends of several of the other houses. That best form of *O. Inseleyi*, *O. I. leopardinum*, and its fine sport, *O. I. splendens*, are also represented, as well as *O. grande*, which, if it be an old and well known Orchid, is yet the showiest of its section. *Lælia autumnalis atrobrenans*, too, is beginning to make a great show in the cool Mexican-house, and *Oncidium unguiculatum*, *O. ornithorhynchum*, and the large batches of *Odontoglossum Cervantesi* and *O. Rossi majus* promise a fine display. Against the shady wall of the Mexican-house a pretty effect is made by planting a single row of *Tridesmania* at its foot, which, closely clinging to the wall, has clothed it with a pretty covering of green and silver leaves, pleasant to look upon and healthful to the Orchids suspended overhead. Among the Brazilian and other *Oncidiums*, all of which are here grown cool, *O. varicosum*, which covers the whole of a roof, rivals the show of *O. tigrinum* with its numerous fine spikes of golden flowers; *O. microponon* and its unspotted yellow variety, *O. chrysopterum*, are both curious and

pretty; *O. Phalænopsis*, which is always one of the neatest of white and violet-flowered cold-house Orchids, is in flower in many varieties; and *O. Marshallianum*, *O. dasystyle*, *O. Jonesianum*, and *O. incurvum*, in flower or in bud in great profusion. The curious little *O. Limmingsheii* also, like a miniature *O. Papilio*, is in flower; and a great quantity of the neat yellow *O. cheiroporum*, which was one of the admired novelties in Senator Jenisch's garden at Hamburg thirty years ago, but which is still not common.

The large Cattleya-house is fitted at each end with a very massive and artistic rockery with cascades, fountain and basin, and a new feature is introduced by planting it with large masses of white *Lælia anceps*, *L. purpurata*, *L. elegans*, *Vandas*, *Cattleyas*, *Cypripediums*, and other Orchids, mingled with *Feris*, *Begonias*, &c. All are thriving well, one of the *L. purpurata* having over a dozen flower-sheaths, and *L. elegans*, *L. autumnalis atrobrenans*, *Cattleya Gaskelliana*, *Cypripedium Schlottmii*, *Zygotopetalum maxillare* (on living stems of *Alsophila ferox*), *Oncidium varicosum*, *O. tigrinum*, and others are in flower—the whole having a fine effect, and all the more attractive as it is the first attempt of the kind with Orchids on such a scale. The Cattleya-houses are filled with good things, among which the thousands of well sheathed plants of *C. Trianae* will be the next to make a show. In bloom are a new form of *C. bicolor*, with Indian-yellow sepals and petals and violet-crimson lip; the fine *L. elegans prasiata* of the Turneri section, but with a fragrance equal to that of the sweetest Rose; *Cattleya granulosa*, *Lælia xanthina*, *Zygotopetalum intermedium* and the rare *Z. obtusatum*; *Acinetia Barkeri*, *Grobysa galata*, and some *Miltonias* and *Burlingtonias*.

In the 300 feet long *Dendrobium*-house the new *Spathoglottis Augustorum*, *Cymbidium affine*, *C. giganteum*, and many *Lycastes* and varieties of *Lælia pumila* are in flower; and the new *Dendrobium hercoglossum*, the little plants of which are covered with sprays of waxy pink flowers of good size, proves itself to be a very desirable and distinct species. Among the *Cypripediums* a fine lot of *C. Spicerianum*, and an equally large batch of *C. Lawrenceanum*, together with several specimens of *C. cananthum superbum*, *C. Haynaldianum*, *C. Godefroye*, *C. concolor*, and others, are in bloom, and with them *Acrides Lawrencei*, and many *Dendrobium bigibulum* and *D. Dearei*. In the other houses we noticed flowering specimens of *Epidendrum raniferum*, *Phalænopsis Sanderiana*, *Dendrobium densiflorum*, *Dendrochilum Colbianum*, *Compreatia macropterum*, *Galeandra Baueri*, *Odontoglossum Oerstedii majus*, *O. odoratum* (true), *O. constrictum*, and *O. Sanderianum*, *Vanda undulata*, and many reputedly new or rare types promising for bloom—the charming blue *Saccolabium coeleste*, the curious terete-leaved *S. mitratum*, and the ruby-flowered *Acrides Godefroyanum*, from their known excellence, being of special interest among them.

The glass department at the old nursery in the town has been entirely transformed, the old houses having been removed, and a dozen neat spans, all opening into a lean-to corridor, built in their places. These houses have been arranged for the purpose of crossing and raising hybrid Orchids, considerable success having already attended the efforts in this direction in Masdevallias, *Cypripediums*, and other things. Two of the houses are filled with *Phalænopsis*, three with *Masdevallias*, one with *Oncidium macranthum*, and *Odontoglossum Edwardsii*, one with Mexican *Lælias*, and so on, all being in the best condition possible.

INGA PULCHERRIMA.—A small plant of this novel South American plant—a recently struck cutting—is now in flower at the Royal Exotic Nurseries, Chelsea. It is quite a tiny plant, but it has thrown one cluster of erect long crimson-coloured stamens. Mr. Court states that he has had the plant under his care at the above nurseries for the space of twenty-three years, but has never previously succeeded in flowering it, though he had seen fine specimens of it in Mexico, 6 to 8 feet in height, and covered with clusters of flowers. It is there cultivated as an ordinary greenhouse plant, placed out-of-doors during the summer, but housed during the winter. The cutting—now a blooming plant—was taken only in August last, and it was bloomed in the pot in which it was rooted.

MARKET PLANTS.

TREE CARNATIONS.—It is hardly necessary to say that these are among the most popular flowers of the day. As pot plants, however, they hardly come within the range of market plants, but they are very extensively grown for cutting purposes, and many of the varieties are well adapted for decorative purposes when the plants are well grown; and they should become more popular with the decorator, now that we have many varieties of very distinct colours, which will form dwarf compact plants, and flower freely. For cut bloom it is the self-colours that are the most valuable, especially the yellows, crimson, and the flesh-pink variety Miss Joliffe—this is perhaps the most useful of all the class, as it has a peculiarly delicate shade of colour, which is not to be found in many other flowers, and it is moreover a colour that is very fashionable at the present time.

Although for some time past Carnations have found a ready sale, and have realised a fair price, there is a danger of the supply being overdone, as is the case with most classes of plants that come into favour. When the supply of any particular plant or flower is in excess of the demand, the great evil is that the surplus is sold at considerably less than the sum the regular florist has to pay, and the plants are hawked about the streets, and perhaps sold in front of his shop, for less money than he has had to give for his supply. As soon as this is the case the florist is obliged to use something different, even though he cannot find anything more suitable for his higher class trade. The prices that Carnation blooms will realise vary considerably; a fair average price for good blooms is from 1s. to 1s. 6d. per dozen, but sometimes the price will go considerably higher, especially for yellows, or extra fine blooms of crimson—these will sometimes fetch from 4s. to 6s. per dozen, and I have known the prices to go even higher than that; while, on the other hand, it is often difficult to find purchasers at any price. Plants are sometimes in demand for country trade—the price of these vary from 9s. to 18s. per dozen, for plants in 48-size pots.

CULTURE.

In the culture of Tree Carnations various methods are followed by different growers. In some cases where they are grown exclusively for cutting purposes the same plants are grown on from year to year, and these, when kept clean and healthy, produce an immense quantity of bloom; but in most cases young plants are preferable, as they are more easily kept in order, and can be grown in positions where the accommodation would not suit the larger plants. In some cases the plants are flowered planted out under glass. The only objection to this system is that they are not so much under control, and often occupy space that might be more profitably utilised if the plants could be more easily removed as they go out of flower. Another system is to grow young plants on planted out in the open borders during the summer, and take them up and pot them in the autumn. Where soil, situation, &c., are suitable, fine plants may be obtained in one season, but there is always a risk of the plants suffering somewhat from being disturbed just at a time when the pots should be well-filled with roots. The most commendable system is to grow young plants on in pots, and these, if propagated early in the year, will make good plants for flowering the following winter.

PROPAGATING.

The first point of importance is to secure good healthy cuttings, or pipings as they are usually called. Some sorts do not produce side-shoots very freely, and in such cases a few plants should be stopped back, and placed in heat; if this is done, they will soon break out and give some clean, healthy pipings. It is of more importance that good pipings should be obtained than that they should be put in at any particular time, therefore the stock should be looked to, and the pipings taken, as they are ready, commencing, say, early in January, though it will be quite early enough to obtain good plants the same season, if the pipings are put in by the first week in March.

In taking the pipings it is not necessary, as is sometimes recommended, to pull them off close to the old stem, but they may be pulled out, or cut off a few joints away from the stems, and this does not damage the plants so much. If the pipings are pulled out it is necessary to be careful to avoid bruising them in any way, and care should also be taken that they are

not allowed to get withered before they are put in. Another point of importance is, that that they should only be put in the soil just deep enough to keep them firm, and the compost used should consist of nothing that is likely to favour the growth of fungus. Loam, leaf-mould, and sand in equal parts, form a good compost, and the pots should be well drained. The best position for striking Tree Carnations is in a close frame where is a good brisk bottom-heat. The frame should be opened every morning and left for an hour or so, but not long enough for the cuttings to get withered, and they should not be allowed to get quite dry in the pots. The greatest enemy to the propagator of Carnations is damping, which is generally attributed to excess of moisture, but I believe it is more frequently brought about by first allowing the pots to get too dry, or, by creating a stagnant atmosphere through not regularly attending to the ventilation. However, with the greatest care, this evil cannot always be avoided, therefore it is necessary to keep a careful watch, and take steps to eradicate it on its first appearance, otherwise a whole batch may soon be destroyed. They should be removed from the propagating frame as soon as they are rooted, and gradually exposed to more light and air. After being properly hardened off they should be potted off singly in 60-size pots with as little delay as possible, and potted on as they require it. Most of the early struck plants will require stopping once, but those struck later may be grown on without being stopped. As soon as the plants are well established they should have all the air possible, and by the end of June they may be placed out-of-doors; a sheltered position should be selected, and to prevent worms from penetrating the pots, the ground should be well covered with ashes.

COMPOST.

In preparing the compost for potting, it is essential that everything used should be as free from worms as possible. The soil should be fairly rich, and should contain sufficient grit or sand to ensure a free passage for water. The plants should be potted moderately firm; of course a good deal depends upon the soil and the condition it is used in; if the soil is light they cannot be potted too firmly.

WATERING.

It is very important that the watering should be carefully attended to, as either excess of drought or moisture is very damaging. I may add, however, that it is better to err on the side of keeping them too dry than to use too much water. After the pots are well filled with roots a little stimulant may be used frequently, but this should be of a mild nature. And an occasional syringing with clear soft water will go a great way towards keeping the plants free from fly.

VARIETIES.

The varieties included in this section of Carnations are numerous, and among the newer introductions are some valuable improvements; yet many of the older sorts still hold a high position, and it would be difficult to get anything to supersede some of them. Among the scarlets, for instance, although there are some very fine new varieties, yet Lucifer and André Alegatière are, perhaps, more extensively grown than any other scarlet sorts; this is on account of their not being so liable to spoil, and of their being so remarkably free and dwarf in habit. All the varieties are liable to considerable variations, and it is on this account that opinions are so much at variance as to which are the most desirable sorts to possess. The following selection may include more varieties than are usually grown for market work, but where a collection is grown all will be found useful.

Whites.—Mille. Carle, pure white; dwarf and compact in habit; very free. It is comparatively a new variety, and certainly a great improvement on any other white variety that I am acquainted with. There are several other good white varieties, among which may be included L'Hermione, Lady Rose Molyneux, Purity, La Belle, and White Swan. The last-named, though rather of straggling habit, is still a favourite with many growers.

Scarlets.—Lucifer: this is one of the most useful scarlets for general purposes, though some give the preference to André Alegatière; but we find this more liable to sport than the first-named. Rufus: deep crimson-scarlet; very useful. Raspail: a new variety of great merit; the flowers are large, bright in colour, and the plant is of good habit. Field Marshal, Duke of Albany, Worthington G. Smith, and

Huntsman, are all of about equal merit. Another scarlet that must not be omitted is Sir Charles Wilson; this has very large fringed flowers, and is of vigorous habit.

Yellows.—Pride of Penshurst: this is undoubtedly the best yellow Carnation, although it is usually included with the border varieties; it may be grown with the section under notice, as it will flower freely throughout the winter, or rather, I should say, may be had in flower throughout the winter by growing on plants for succession. Mrs. G. Hawtree: this is an older variety, somewhat similar to the above. Tisot's Yellow: pale sulphur-yellow; very good. Chevalier: pale yellow, slightly striped with pink; a good variety, with fine, well-formed flowers. Prince of Orange: yellow, edged with pink; a good useful sort. Andalusia: pale yellow, large fringed flowers; one of the best winter bloomers. Boissy: pale primrose; very free.

Crimsons.—Dr. Raymond, deep crimson, flowers well formed; plant dwarf and compact in habit; very fine. Negro, dark crimson; very good. Mrs. Keene, Indian Chief, Burgundy, and Valencia are also good varieties; the latter has fringed flowers.

Pinks.—Miss Joliffe: I have already alluded to this variety, and can only add that too much cannot be said in its favour. Another good variety of a similar shade of colour is Lady Macbeth. Helena, deep rosy-pink, flowers large and well formed; plant of good habit. Magnifica, and Seraph are both of a similar shade of colour. Laura, a fine variety with fringed flowers, soft flesh-pink.

Various.—Jean Sisley, flowers large, colour buff striped and flaked with crimson; habit dwarf and compact. Empress of Germany, flowers very large, pure white, slightly tipped with scarlet; very fine. Gaiety, buff flaked with crimson; well formed flowers. Whipper-in, scarlet and crimson striped; fine large flowers. Atime, scarlet and blush striped; very effective. La Zouave, pink and scarlet striped; very free. A. Hensley.

THE CEDARS AT BAYFORD-BURY.

We are now able to lay before our readers an illustration (fig. 102) of some of the noble Cedars which were mentioned in our columns recently by Mr. Baker, who naturally takes great pride in his noble trees (see p. 427). The Cedars in question were planted about 1765, some of them being seedlings from a tree still in existence at Enfield, and their dimensions are given in Mr. Baker's note at p. 427. It is interesting to note also that seedlings from these trees come up freely all over the garden, so that if they were allowed to remain undisturbed the Cedars at Bayfordbury would form as thick a grove as on the slopes of Lebanon. An account of this very charming and specially interesting garden and pinetum will be found in our columns, August 22, 1885, p. 229.

THE ALPINE GARDEN.

SOIL FOR ALPINE PLANTS.—A note of Mr. G. Maw, on p. 500, calls attention to this subject, so interesting to all growers of rock plants. It may be doubted which of the two is the more important factor in their successful cultivation—atmosphere or soil. Mr. Corvevo, who has had long experience, says on the last page of his *Plantes des Alpes*, that "the chemical and physical composition of the soil is all-important." Anyhow, the influence of atmosphere and climate are beyond our control, but soil may be made up in any mixture.

The greatest mistake generally made in attempting the cultivation of alpine is giving them too rich and too easily found food. The roots of these hardy mountain plants should be obliged to wander far to search for and gather a maintenance, and this constant exercise keeps the plants in health. Hence, I have always found that what may be called the mechanical conditions of the soil in which they grow is of even more importance than the chemical. A mixture of three-fourths finely broken stone or brick or well selected sand, with one-fourth good soil, will keep most alpine in health better than a richer compound.

After many experiments I have found that some fastidious and difficult plants, which have seemed unmanageable, have done well when planted in sand or fine gravel riddled from the waste of granite quarries. The dark red granite of Mount Sorrel, in Leicestershire, to which Mr. Ingram, of Belvoir, first directed

me, is the best I have tried. This is delivered, carriage paid, at my station in Cheshire, for about 10s. a ton. Mixed with a small proportion of humus and loam this suits many *Androsaces* and such-like alpinæ admirably. One cannot give general directions for the cultivation of all alpinæ, each of which should be tried under varied conditions. In Kerner's *Cultur der Alpenpflanzen*—a treatise I should much like to see translated into English—we have an alphabetical catalogue of choice alpinæ, with three columns in front of the names. In the first is given the degree of decomposition of the rock in which the plant is generally found, which suggests the proportion of humus it requires. In the second column is stated the lime-loving or lime-hating or indifferent character

be difficult to say, for botanists do not seem to have found a station for it in that country yet. It occurs, however, on many of the islands and on the south coasts of the Mediterranean, and according to accounts forms rather a procumbent straggling under-shrub when it attains any size. Whoever has seen it under cultivation in British gardens could hardly imagine it possessed such a habit, for, whether grown in pots or planted out, in both cases it maintains a close, bushy, branching, upright deportment. The flowering season has been variously recorded from June to October, but in fact it keeps on flowering for a great length of time, fresh flowers being produced on the young shoots. At the present time flowers are freely produced—a redeeming feature that

from June to October. The plant is perennial and procumbent at the base, with a somewhat woody rootstock, from whence arise the flowering shoots, that do not exceed 4 or 6 inches. Many of these ascending or erect branches are flowerless and perennial, giving the plant an evergreen and tufted appearance all the year round. Truly alpine in character and perfectly hardy, this rock plant may be depended on to take care of itself when once perfectly established, and if allowed to develop to a broad spreading patch will hang over a hedge in a graceful way, just fringing the place around which its roots maintain a foothold, for although the lower and older part of the plant is procumbent or even prostrate it never becomes coarse nor travels far. The flowers are

FIG. 102.—CEDARS AT BAYFORDBURY, HERTFORDSHIRE. (SEE P. 520.)

of each plant; in the third its preference for sandy or loamy soil.

To this table I always refer when any new or rare alpine first comes to me. But if I can obtain several plants of the same species I much prefer to determine the best treatment by experiment. How a plant grows in its natural habitat is one thing, how it will thrive under entirely changed circumstances of atmosphere and climate is another, and the conditions required in the latter case are often shown by experience to be quite different from those of its native home. *C. Willey Dod.*

HYPERICUM ÆGYPTICUM.

Nearly one hundred years have elapsed since this plant was originally introduced to Britain, as its specific name would imply and as record hath it from Egypt. How this latter statement originated it would

compensates for their small size. In general appearance the plant resembles some of the shrubby New Zealand *Veronicas* such as *V. epacridea*, but is of a pale glaucous colour, whereas the latter is of a deep shining green. A reserve stock of plants should be kept in the cold frame in case of loss from a severe winter, but unless in exceptional cases, plants will survive out-of-doors in warm, sunny, sheltered places on the rockwork. The species is figured in the *Botanical Register*, t. 196, and more recently in the *Gardener's Chronicle*, n.s., vol. xiv., p. 503, l. 95.

SILENE SCHAFTA.

In particularly dry exposed places the flowering season of this dwarf alpine is short. It is able to exist, however, on account of its deep rooting habit, but where the soil is somewhat moist it will continue to make fresh growth and put forth fresh flowers

solitary or twin, and of a pleasing rosy-purple, of medium size, terminating the shoots. This species is a native of Transcaucasia and Persia, inhabiting elevations ranging from 2500 to 4000 feet. There is a figure in the *Botanical Register*, 3220, and an uncoloured figure in Regel's *Gartenflora*, 724t. Except when many plants are required there is little need to propagate, but when necessary the younger and green shoots are the best, for although (especially in dry places) the plant produces many flowerless shoots, they do not succeed well when once they have become wiry.

PLUMBAGO LARFENTE.

Annually as the seasons roll round and the shortening days of September give way to the unsettled and often blustering October weather, the rockwork or border in which this striking Leadwort is grown is

enlivened in no ordinary manner. This is partly due to the intensity of colour, an unusual shade of blue, and its advent at a season when there are few things out-of-doors approaching that hue except the *Asters* in their endless diversity of shades, and partly to the suddenness with which they seem to burst into flower when the conditions and surroundings are favourable. This latter character is owing to a habit possessed by other members of the same family of opening a number of flowers at a time when conditions are favourable, while the rest lie concealed within the bracts and calices. The petals of this *Plumbago* are very delicate in texture and easily destroyed, but continue to expand and create a display in mild weather till late in autumn. For some time after its introduction this plant was cultivated in pots with good effect. It naturally likes a dry soil, which accounts for its easy cultivation in pots. Fortune discovered it on the ramparts of Shanghai, and afterwards Smith in the same place, and on the stonework of the city wall. This proves it naturally a rockwork plant, but being somewhat tender it should be planted in a sheltered nook, to retain the foliage as long as possible. The rootstock is perfectly hardy in a well drained soil, comes up readily in spring, and increases rapidly where there is accommodation. There is a figure of the species in *Paxton's Magazine of Botany*, xiv., 267, and it is synonymous with *Valoradia plumbaginoides*.

ERODIUM REICHARDI.

Excepting *E. maritimum*, which, however, is only a casual in herbaceous borders, and altogether insignificant, the species above-named is one of the dwarfest and most compact habitated *Erodiums* we have. Unfortunately, it is not so hardy as is desirable, but being easily propagated by division of the rootstock, a reserve supply may be kept in small pots in an unheated frame or other structure. Accommodation can easily be obtained for it on the rockery in a small crevice between the stones, with plenty of exposure to sunlight. Not being a succulent, however, it must not be planted where the roots have insufficient depth of soil, or a supply of moisture necessary to preserve it from being parched up. As a precaution against this, it should be so situated that the falling rain would have access to the soil in which it is planted. There is an uncoloured figure of the plant given in Lamarck's *Encyclopædia*, plate 573, fig. 2, under the name of *Ceranium* Reichardi. About a hundred years ago, when this plant was first introduced, both *Erodiums* and *Pelargoniums* were included under *Ceranium*, although all are sufficiently distinct, and now clearly defined. The leaves are small and neatly heart-shaped, forming a close dwarf tuft, from which the peduncles arise, bearing a solitary, comparatively large white flower, sometimes more or less veined with pink. The whole does not exceed a height of 2 or 3 inches, and flowers are produced throughout the summer season, and often well into autumn. *J. F.*

GRAPES FROM HUNGARY.

At the last meeting of the Fruit Committee at South Kensington a very interesting exhibit of Grapes, grown in Hungary, was sent by Herr Horvath, of Fünkirchen, which are well worthy of something more than the brief notice that was bestowed on them in our report of that meeting. They were chiefly of the smaller varieties, with pleasant flavours, which it is to be regretted are greatly neglected now in this country for mere appearance sake. The clear translucency of the white varieties was particularly noticeable, and the flavour of all particularly rich and piquant, giving evidence of the fine climate and hot sun enjoyed in that part of the world.

1. *Muscot of Hungary*.—This is the variety most generally grown in Hungary. The bunch is small, berries small, roundish-ovate, greenish-white, with a firm flesh and a pleasant Muscot flavour.

2. *Royal Muscadine*.—Very clear skin, almost translucent, sweet, well ripened.

3. *Muscot of Alexandria*.—Bunches badly set on account of cold, wet weather at time of flowering. Berries rather small, well ripened, and of good quality.

4. *White Frontignan*.—Very good, well ripened; colour light orange.

5. *Muscot Quadrat*.—Stated by Herr Horvath to be "the same as white Frontignan, only that the berries are larger and oblate in shape, just like a flat Tomato." This is a very interesting variety, quite

distinct—well worthy of trial. The quality is excellent.

6. *Gravelly Frontignan*.—Much darker in colour than it is usually seen here. Excellent in quality.

7. *Chasselas Musqué le Vrai*.—This seems to be intermediate between Royal Muscadine and the Chasselas Musqué as generally grown in England. The berries are larger, and not so firm or so high flavoured, and "do not crack," Mr. Horvath states, which is a notorious character of it with us.

8. *Muscot Fleur d'Orange*.—This possesses the rich flavour and firm crackling flesh of our Chasselas Musqué, and is given as a synonym in *Vines and Vine Culture*. Can it be that our Chasselas Musqué is not the true one?

9. *Chasselas Rose*.—This resembles the Royal Muscadine in quality; the colour of the berries is dark rose, and if over-ripe assume a purplish shade.

10. *Chasselas Rose de Falloux*.—Distinct from Chasselas Rose, the berries being always of a light rose colour.

11. *Chasselas Violet*.—Herr Horvath states:—"The berries of this variety turn red directly after flowering. When ripe they are light red, and when over-ripe still lighter in colour. This sort is not called Violet on account of the colour of the berries, but the young shoots and leaves and the entire plant has a violet tinge." It is sweet and pleasant to eat.

12. *Piscane*.—This is also known under the name of Bulliat—a very fine Grape, having large roundish-ovate berries of a pure white colour, almost sweet and pleasant.

13. *Chavoush*.—This is always highly spoken of where grown in the East, and the examples sent by Herr Horvath were really excellent, the berries large, roundish-ovate, clear-skinned, highly perfumed; nearly equal to the Muscot. Why is it, when cultivated in this country, so inferior?

14. *Muscot d'Anatolie*.—This variety is highly recommended, its only fault being a tendency to grow too strong. The bunch is large, well set; the berries of medium size, roundish-ovate, of a dark reddish-purple. Extremely rich and high flavoured, well worthy of cultivation.

15. *Muscot Hamburg*.—This seems to succeed well in Hungary. The berries were almost jet-black in colour, and of excellent quality.

ROOTS.

(Continued from p. 458.)

Many plants flourish in an open soil with plenty of sand in it, but will not grow in a stiff wet soil. This is not necessarily because the heavier soil does not contain the right food materials, but because its particles are so small, so closely packed, and so retentive of moisture, that the root-hairs do not obtain sufficient oxygen: moreover, the very damp state of the soil does not favour the development of the numerous root-hairs necessary, as we have seen. Nor is this all—though I cannot here enter at length into this point—root-hairs and roots cannot grow or act unless the temperature is favourable, and we have plenty of evidence to show that a close wet soil may be too cold for the roots at a time when an open drier soil (exposed to similar conditions as regards sunshine, &c.), would be of a temperature favourable to their growth. Many a pot-plant receives an overdose of water because it is drooping from the roots, being too cold to act properly. The opening up of stiffer soils by means of the spade or plough, or by the addition of other kinds of soil, such as sand, burnt lime, &c., or by means of drainage of various kinds, is thus to be regarded as a means of letting in air, and therefore oxygen, to the roots. "Sweetening the soil" is an expression one hears used by planters and others: this is often no doubt their way of expressing the fact that the air thus let in does so much to turn the noxious substances which have accumulated into other substances which the root-hairs of the plant can take up with profit. The exposure of certain soils to sharp winter frosts in part benefits the plants subsequently grown in it, because air can make its way into the cracks produced as the particles crumble: there are other advantages also due to the "weathering" of soils, of course, as also to the addition of lime, &c., but I am purposely abstaining from referring to points concerning the nutrition of plants as generally understood.

Let me shortly call your attention to a few other practical applications of the knowledge briefly summed

up above. It is well known that a good deal of experience has been brought to bear on the question of what trees are the best to plant in or near large towns: there are very many facts to be considered. It is not sufficient to find a tree which will accommodate itself to the possibilities of the annual rainfall, or a diminished supply of sunlight throughout the year, and so on; nor is the problem solved when a tree is found that will put up with traces of acid gases in the atmosphere, and, as may follow, the accumulation of acids in the soil, and consequent alterations in its chemical composition. In many cases trees have been found to die as they grew older because the pavement or asphalt over their spreading root-system prevented proper aeration and a proper supply of aerated water to their root-hairs; imagine the effect of a few days' hot summer sunshine on roots just beneath the pavement of an exposed street! It is true the cover may prevent rapid evaporation, but it also shelters the soil from the well aerated raindrops; moreover, such sheltered roots will at certain seasons grow up to the surface of the soil and in contact with the lower surface of the pavement. Then there is the question of drainage. If the water which does find its way in slowly accumulates and becomes stagnant, the results are as disastrous or even more so; yet it is obviously a difficult matter to arrange things that the accumulated surplus water of certain seasons shall pass away below, acting like a suction-pump and drawing in air after it, and still fulfil the other requirements hinted at above. I leave out the question of exhaustion of the soil—the dead leaves, &c., being carefully removed. Can we wonder that there are so few trees to choose from that will stand such treatment? The fact that there are some only accords with what has been already stated—that plants vary in their requirements and powers; and no one doubts that the variations have been influenced by variations in the environment.

We have now seen to a certain extent how variations of a particular kind may affect a plant. The plant responds to a certain extent—it is, as some people say, "plastic"—but if the limits are reached and slightly overstepped, the variations on the part of the plant become dangerous to its existence, and the plant becomes diseased and may die.

Not to dwell upon hypothetical matters, I will content myself with saying, in conclusion, suppose a variety of a given plant grows in damp places and has roots which form few or no root-hairs, and suppose an individual of that plant to become transferred to a more open soil; I have shown you reasons for regarding it as probable that the latter individual might produce more root-hairs and thus adapt itself to the altered conditions. If such a case happened, it is by no means improbable, but the contrary, that other circumstances co-operating or adverse would decide certain problems of importance to the existence of that particular individual.

But the main object of this lecture has been to show you how very complex the conditions may be which bring about a "diseased" condition of the roots. It is an uncommon event to see a tree flourish for years and then die slowly off from "something at the roots"; examination shows that the soil still contains the necessary foods, the water-supply is constant and good, the tree is exposed to no obvious adverse influences, and yet with steps so slow that they are scarcely noticeable, the tree begins to die off before its time. In some cases this is probably because the root-hairs are not receiving their proper supply of atmospheric oxygen, and this may be due to very slight changes in the structure (not the chemical composition) of the soil: a very slight diminution in the activity of the root-hairs may cause a diminution in the supply of water to the leaves at seasons when they require much, and this means lessening their supply of food-materials. If the leaves are placed on short commons they cannot form wood, and so the next season's supply of nutritive solutions may be cut short; moreover, fewer root-hairs will be formed. No doubt differences will appear in different years or seasons; but if the tendency on the whole is in the above direction, the life of the tree is already limited—it may drag on for years as an object, which can scarcely be termed a tree, however, but its doom is sealed.

The difficulty of placing one's hand on an exactly illustrative case is due to the fact that other causes are usually at work after a short time. I have purposely avoided any reference to the changes brought about in the chemical nature of a soil by the addition or

cutting off of air, &c.; and for the same reason—to keep your attention directed to the root-hairs as living cells exposed to the influence of a definite environment—I have left out of account some questions of food supply. These matters do not invalidate anything said above, but they do profoundly affect the problems of the diseases of plants, and especially those diseases which start from the roots. *H. Marshall Ward, M.A., F.L.S.*

MANURES.

(Continued from p. 129, vol. xxxv.)

The character of the soil is as well known, an important element to be taken into account in the choice and application of manures. The general difference between strong and light soils may be taken to be that the former contains a larger store of the natural elements of fertility, though for the most part in an undeveloped state, while from an excess of clay the physical property of retentiveness and its consequent drawbacks are too prominent; while light soils, on the other hand, are comparatively deficient in natural resources, and by reason of a deficiency of clay possess the property of porosity in a too great degree, and hence afford a too ready passage for water, and other bodies necessary to vegetable growth.

CLAY SOILS.

On stiff clay soils we have all the defects arising from the tenacious and plastic properties of this substance, and its consequent imperviousness to water, hence the first necessity towards the improvement of such soils must be drainage, in order to remove the excess of water, and without which the best manures will have but a meagre effect. All means of adding to the porosity of stiff clay soils are to be recommended—one of the best of which is burning in heaps with vegetable refuse, or small coal, in the manner "ballast" is burnt, and which spread over the surface before digging, has an excellent effect in lightening the soil.

It is on these descriptions of soil that a thorough breaking up and stirring at favourable times is so beneficial, particularly before frost, which does more for strong clays than almost anything else. In fact, cultivation on these classes of soil must always be the primary resource for advancing their fertility—but supplemented of course by a judicious selection and application of manures.

As an illustration of the beneficial effects of a thorough breaking up of moderately stiff soil on vegetable growth, we may quote an experiment conducted at Rothamsted many years ago with white Turnips, on three plots of ground, each plot being manured in exactly the same way, namely, with 11 cwt. of superphosphate per acre.

Experiment with White Turnips.

No.	Treatment of Land.	Average Weight of Buds.		Produce of Buds per Acre.
		Lb.	Tons cwt. qr.	
1	Dug 9 inches deep ..	1.80	13 8 2	
2	Dug 12 inches deep ..	1.39	14 4 0	
3	Ploughed 5 inches deep ..	1.17	12 13 3	

These results indicate the character of the soil-conditions required in root culture, and show a more rapid bulb-formation, with a corresponding increase of crop in proportion as the land was broken up and pulverised.

SANDY SOILS.

In sandy soils we find all the defects arising from an extreme porosity, or, in other words, an absence of retentiveness consequent on the paucity or absence of clay, which is the chief storehouse, so to speak, not only of the moisture of the soil, but also of plant-food, either artificially added or derived from natural sources, and from which the root-fibrils of plants draw their supplies as required.

The retentiveness of such soils may be enhanced by the addition of clayey composts, and by green manuring.

GREEN MANURING.

is often an excellent source of plant-food in the lighter description of soil, and deserves to be more extensively adopted, as we thereby obtain a clear gain of nitrogen from natural sources, and at the same time gather up and preserve any nitrates present in the soil in a staple and efficient form; while the

humus compounds arising from the decay of the vegetable matter afford an absorbent for moisture, &c., in the same manner as clay. That vegetable matter in a readily decomposable state is a valuable form of manure is shown by the character of the Wheat crop following a Clover lea. Where the Clover has been successful, the Wheat plant, as well known to the agriculturist generally, corresponds, and *vice versa*. Dead leaves and garden refuse of all crops not consumed as food should therefore be carefully returned to the land, as they are rich in manurial elements in the best possible state for future plant-life when prepared by decay in soil.

The following table shows the amount of selected chemical constituents in some of the waste products of the garden:—

Description.	Number of Pounds in One Ton of Each, Fresh.			
	Nitrogen.	Phosphoric acid.	Potash.	Lime.
Potato haulms	12.2	2.2	11.2	6.5
Carrot tops	14.5	4.6	6.5	29.9
Parsnip tops	14.0	2.4	7.2	24.0
Turnip leaves	6.6	2.4	7.9	7.7
Fava haulm	45.0	7.3	22.4	69.4
Artichoke, stem and leaf ..	7.0	1.0	10.6	71.9
Onions, stalks and leaves ..	6.0	0.9	2.7	4.7
Broccoli leaves	4.0	6.3	8.3	10.1
Radish tops	4.5	3.8	3.4	12.9
Beet tops	14.3	1.6	9.5	2.7
Rhubarb leaves	5.7	8.3	4.0	1.1

We can readily understand from the foregoing statistics that every portion of a plant, whether useful as human food or not, removes from the soil a given quantity of its fertility, and therefore impoverishes the soil so much plant-food.

But lest these remarks respecting green manuring may be thought to be at variance with the maxim that we should never use as manure what can first be used as food, it may be added that under exceptional circumstances, as in the case of light sandy soils, waste vegetable produce may be more valuable as green manure than as food for animals, by conducing to a physical improvement of the soil, and consequently to a higher degree of fertility.

We may take it as a general rule not to burn any refuse that will rot in the soil, except in the case of foul turf infested with insects or seeding weeds, &c., since by so doing we lose the nitrogen and organic matter, besides rendering the ash constituents less available by mineralising them. Sir J. B. Lawes and Professor Gilbert have subjected this theory to a most rigid investigation at Rothamsted.

The ashes of 14 tons of farmyard manure were applied to an experimental crop of Wheat, and gave no increase of produce whatever over an adjoining plot that was left entirely unmanured, and in succeeding years the ash constituents were found to be but very slowly available as plant food.

Besides all this, able chemists have demonstrated by growing plants in distilled water, that to produce a good crop there must be nitrogen in the soil or in the water. They have dissolved the ashes of plants in pure water, and then, by adding a few grains of nitrogen in the form of a nitrate, have produced a luxuriant vegetation; but without nitrogen only a very feeble growth could be obtained.

WEEDS.

The field experiments at Rothamsted and also at Woburn conclusively prove that crops of every description grown upon ordinary cultivated land are greatly reduced by weeds. It is true that weeds, if again returned to the land, do not exhaust a soil, as, in their decay, the fertility which they have taken up becomes again available; but weeds take up nitric acid, which during their growth reverts to the form of organic nitrogen. When this occurs in regard to soluble plant food it is merely so much nitric acid employed in growing weeds instead of useful garden produce, and this nitric acid does not again become available as food of plants until the weeds have undergone decay in the soil and become nitrified. *J. J. H.*

TRADE MEMORANDUM.

J. P. WILLIAM & BROTHERS, Seedsmen, Hencragoda, Ceylon.

THE STRAWBERRY.

WTO can say anything new about the cultivation of Strawberries? I for one am not about to undertake to detail any novel system; but it will readily be admitted that between a well cultivated quarter of Strawberries and one where they are allowed to take care of themselves the difference is very marked. How often do you see in gardens a bed of Strawberry plants where the runners have been allowed to increase and multiply until no traces of the original rows are discernible amid the mass of foliage? Such a bed as this is treated differently according to the predominating taste of the owner, or rather his ideas of culture. On one occasion I observed the autumn treatment of such a bed in preparation for the winter. The procedure was this:—A line being stretched on each side of the row, a spade or edging iron was used to cut through runners and roots, the next process being to dig between the rows, leaving the soil laid up rough for the winter. This operation makes a sad havoc of the roots, and cannot be but permanently injurious to the plants. Even if this were not so the mass of runners prevents the permanent plants from fully developing themselves up to October, and after that time, when the beds are dug, the atmospheric conditions are not sufficiently favourable for the plants to recover. In some cases of this kind the owner of the bed will not have it disturbed at all. On one occasion, when visiting a gardening friend who had entered a new situation, he told me his employer drew his attention to a Strawberry bed that had been planted about twenty years, and the instructions were that on no account was it to be disturbed. Any one with the least knowledge of the principles of gardening ought to know that good Strawberries cannot be produced from a bed that had been left undisturbed for twenty years, and it is not an easy matter to instil radical principles into one holding such conservative views. The right thing for a gardener to do in a case of this kind is to avoid argument, and at once make the necessary preparations for planting a new bed in another part of the garden. It would be best to ask permission to purchase a sufficient number of plants of the best varieties at present in cultivation, or if this might not be prudent any gardening friend would help a brother under such conditions, or as a last resource runners could be taken from the old bed, but they would be weak, and most likely would take a year to recover.

Strawberry plants may be put out in the open ground whenever they can be obtained; they may be planted with a reasonable prospect of success at any season of the year, but a very long experience tells us that by far the best time is the end of July or early in August—that is, as soon as the runners can be obtained by layering them in pots. If they are obtained at that time out of the pots I would suggest that each plant be carefully potted in rich light soil, using large or small 60-sized pots. If strong runners were prepared and planted as I have described on ground that has been first prepared by trenching and manuring, the plants, if well looked after subsequently, would sustain no check to their growth, and would bear well the following season, when a comparison could be made between the old bed and the one not a year old. The bed containing the young plants would produce abundance of large fruit, and good in quality; the other would produce a small crop, poor in appearance and quality. In case the plants have to be propagated, and a full crop of fruit obtained within the limited space of eleven months, the smallest cultural details are of importance, and it is by omitting these that failure results, and not by the neglect of any fundamental principles of the art.

I have been tempted to write on this subject by the numerous complaints that have reached me of the failure to grow a seedling Strawberry raised by me some fifteen or more years ago, named Loxford Hall Seedling. I have grown good crops of this variety every year since it was raised, and last season it carried a much larger crop of fruit in our garden than any other, and we grow all the most approved sorts. Briefly stated, the best method to adopt to obtain a good crop the first season after planting is to layer the runners into small pots as soon as they can be obtained, using to two parts of good loam one of decayed stable manure. We use large 60 pots, without any crocks; over the hole in the bottom of each pot is placed a layer of fibrous turf, and a pinch of soot to keep out worms—this is more especially useful for those plants that are

intended to be cultivated in pots, but it has fertilising properties as is shown by the vigorous healthy condition of the roots which run into and through it. In two weeks after layering the young plants may be cut away from the old stool, and in a week more they may be planted out. It is a wise precaution to examine the under-sides of the leaves before planting them out, and if there should be the least suspicion of red-spider it may be destroyed by dipping the whole plant, above ground, in a pail of water to which has been added a pint of nicotine soap. The process of dipping is this:—Invert the plant, holding the fingers over the surface-mould, to prevent it falling into the pail; then with the other hand move the leaves about for two or three seconds; lay the pot on its side, to allow the water to drain off the leaves. The preparation of the plants being completed, the bed should also be ready in good time; this is prepared by trenching it at least 2 feet deep. In the bottom of the trench place a good layer of manure, and another layer about 9 inches below the surface. I like to have the ground trenched at least two months before planting out the young runners; they take more readily to a surface that has been exposed to the influence of sun and rain for that period. In our light sandy soil over dry gravel at Loxford Hall I grew first-rate Strawberries by treating them as annuals. The plants were put out, the crop of fruit was gathered, and they were cleared off the ground to make room for white Broccoli, or some other crop, within twelve months; but we found it necessary to dig out a hole for each plant large enough to contain one spadeful of good clayey loam, which had been enriched by the addition of a third part decayed manure. The distance between each plant was 2 feet, but for such dwarf-growing sorts as Loxford Hall Seedling 20 inches is enough. At the time of planting the weather is usually very dry and hot. The sun in this country is never too tropical for Strawberry plants; they require, if the weather is dry, water two or three times a week, until they are fairly established. Under these conditions they grow rapidly, and once every week all the runners, which form very rapidly, must be pinched off; the strength of the plants must not be allowed to become exhausted by the production of runners.

We may also find some profit in considering the question of new varieties, and the best varieties to cultivate. In reference to the first, I have had a somewhat similar experience with new Strawberries as with new Grapes; of the latter I have fairly tried during the last quarter of a century twenty new and highly recommended sorts, and have at last fallen back on the Black Hamburg and Muscat of Alexandria: what a saving it would have been if we had grown no others from the first. Conservative principles would have been worth something here, but experience if dearly purchased must be worth something on the credit side. So with Strawberries: we now force nothing but Black Prince and Keen's Seedling. When Pioneer (Laxton) was sent out after it had been certificated by the Royal Horticultural Society, it was purchased, grown, and fruited the next season in pots and planted out, but owing to its inveterate tendency to mildew was a failure both ways from the first. Pauline is a most promising variety if planted out on an early border, but it cannot be recommended for pot culture. We shall fruit King of the Earlies (Laxton) and Waterloo (Veitch) next year; until that time I will not comment further upon them. Between these early kinds and Loxford Hall Seedling there is a wide space to be filled in with three or four distinct and good varieties.

I find on referring to my notes that Loxford Hall Seedling was raised in 1873, by crossing Frogmore Late Pine with a variety named La Constante; we had about 150 seedling plants that year: many of them were tried and found wanting, but Loxford Hall Seedling was most prolific both out-of-doors and in pots. It requires rich deep soil to grow in, and will produce a larger weight of fruit from a given space of ground than any other variety known to me. Black Prince is an excellent variety for preserving; every plant is laden with fruits of a rich dark crimson, and fairly good flavour. Keen's Seedling is still one of the best sorts for flavour, size, and productiveness. President succeeds well in light and heavy soils, and is a grand variety. Sir Charles Napier is still one of the very best culinary sorts; a most abundant bearer; its peculiar sub-acid flavour is esteemed by some; and the handsome bright scarlet fruit, of good form, make up a good dish. British Queen, or Mr. Rad-

cliffe, as we have always grown them, are grand; they do not differ much, and should be grown in every garden. Sir Joseph Paxton does not succeed on light soils, but it is a grand variety where it can be grown: it is liable to mildew. Frogmore Late Pine is a handsome variety; the fruit is large in size, and of a rich pine flavour. *J. Douglas.*

BROCCOLI.

THE accompanying illustration (fig. 103) was engraved from a photograph furnished by the grower, Mr. H. Little, gardener at Bustard Hall, who cut the head on June 5, the weight being 4½ lb. The variety is Leadsham Late White, one of the latest of all Broccoli, and one that quite fills up the gap that used to exist after the last of them was cut, and before early supplies of Cauliflowers came into use.

The Leadsham is a very hardy kind, standing frost and wet with impunity—no mean merit, when we see the destruction a sharp winter causes amongst Broccoli generally—and that, notwithstanding the plants may have been heeled-in in the most approved fashion.

As a precaution against injury from frost, we think if the plants be laid-in in rows it would be of great advantage to put down a row of burdles at every third space, so that the plants would be sheltered from the

probably for their exact length upon the aspects of the prevailing seasons. A prolonged drought in India is often accompanied by the flowering of the common Bamboe, and on this account the natives associate the two phenomena in a manner which is emphasized by the fact that the Bamboe grain during seasons of drought has provided them with the only available means of support. In the winter of 1884-85 all the Chusquea throughout the mountains of Jamaica was noticed in flower. It began to shed its leaves, to assume a dull rusty colour, and break out into abundant flower-spikes. The flowering glumes were of purple colour, and the stamens, rather large, were bright yellow. When the seed was set the stem began to die down, and apparently every plant in the island died, root and all. It is remarkable that this simultaneous act of flowering of the wild plants—which, it must be remembered, is not of annual or biennial occurrence—extended also to the plants at Kew; in fact, both the wild plants at Jamaica and the cultivated plants at Kew (although the latter were under such very different conditions), were in flower at the same time.

Sir Joseph Hooker, referring to the Kew plants, remarks:—"In December last they burst into flower, causing me to fear that, after the manner of so many species of this most remarkable tribe of grasses to which they belong, they may not survive the flowering period." The Kew plants died exactly as the wild plants.

On the wild plants an abundant crop of seed was

FIG. 103.—LEADSHAM BROCCOLI.

sun during those sudden bursts experienced in winter time, and which cause thawing of the tissues, and hence the destruction of the plants.

CHUSQUEA ABIETIFOLIA.

THIS attractive member of the tribe Bambuseae is little known out of Jamaica, where, as a tall, graceful climber, it is confined to the mountainous interior of the island. From a plant sent to Kew in 1882, which flowered in December, 1884, there is given a plate and description in the *Botanical Magazine*, t. 6511, which entirely supersedes the formerly inaccurate description by Grisebach (*Flor. Brit. West Indies*, p. 529).

In its natural state this Chusquea grows with long slender stems, smooth, round, and wiry, seldom more than a quarter of an inch in diameter. The leafy branches are arranged in whorls at the nodes of the main stem, and have leaves, arranged alternately, from six to nine in number. The leaves are about 1½ inch long, and about one eighth of an inch in breadth. The whole habit of the plant is light and graceful, and when, as is often the case, it hangs in long festoons, or in large curtain-like masses from the branches of tall trees, it gives the mountain woods of Jamaica a soft feathery appearance, which is in marked contrast to the usual character of alpine growths.

In the flowering of this plant appears to take place, as the most Bambuseae, at long intervals, depending

produced, and at the present time the ground in the forest where the Chusquea grew is covered with millions of seedlings, and in due time these will take the place of the former generation.

It is hoped that a fresh lot of plants will be introduced at Kew, and that this very interesting, no less than attractive, species will become as well known in European gardens as it deserves. *D. Morris, Assistant Director, Royal Gardens, Kew, October 12.*

CATLEYA CALUMMATA ×.

THIS pretty Cattleya, raised by M. Eleo, of Paris, between C. Acklandiae and C. intermedia amethystina, is a worthy addition to the compact-growing, large-flowered section to which it belongs; indeed, with it, as with most other garden hybrid Orchids, it seems to be even freer flowering than the imported species. Our illustration (fig. 104), taken from a photograph by Mr. Herbert Measures, of a plant in the collection of R. H. Measures, Esq., and which is one-half natural size, gives a good idea of the plant, and also of the habit of growth. The flowers, which are of good substance, have sepals and petals of that delicate bluish-pink seen in C. amethystoglossa, blotched with violet or purple, and the lip is reddish-violet in the centre, fading off to rose towards the edge. Some misapprehension seems to exist about the name, for even by good authorities we have seen it spelt "calummiata" and "calummata," but that given above is the correct name, given to the plant because

of the resemblance of the middle portion of the labellum to a lady's ruff, collar, or chemisette. The plant was distributed by Messrs. F. Santer & Co., of St. Alban's, in 1884, they having purchased the stock of M. Eleu. [The name seems to have been derived from the Greek *kalumma*=hood; but we much fear that a head-master would "swish" a boy who made such an adjective out of a Greek noun, and we are sure that the name offends against botanical canons, by mixing up Latin and Greek, and specially by giving a pseudo-classical name to a plant of artificial origio. ED.]

ship of the olden times, which consisted largely of titles and statements set up for the mere pleasure of knocking them down again. But then, possibly, I belong to a very numerous class of people, rather severely described by Charles Lamb as never understanding a joke until explained to them. Of course very much depends on the character of the joke. But after carefully reading "T. W. G.'s" facetious column I turned for explanation to pp. 429, 430, and was more puzzled than ever. Can it be that there is some distant or close correlation between your correspondent and the man distraught, with "wild

it might not be better for the Teas and more just to other classes of Roses, if the Teas were shown by themselves, and you are dubbed as men distraught, and as advocating the expulsion of Teas. I venture to suggest that the mixing of Teas with other Roses introduces a distracting and disturbing element into the judging of larger collections, and this one reference to distinction in an article of two columns furnishes your correspondent with a hobby-horse on which to canter through openly each of his paragraphs. The idea of any distractions through any conflicting clamour of distinct classes of Roses is

FIG. 104.—CATTLEYA CALUMMATA. (SEE P. 524.)

The Rosery.

EXEUNT TEAS.

"T. W. G." is to be congratulated on his success as a humourist, as it is seldom that your readers are favoured with such a column of banter as may be found on p. 467. Well, well, banter breaks no bones and very few hearts, and a little risibility at one's expense may prove a capital offset to the darkness that may be felt at the agricultural depression that broods like a nightmare over rural life in so many parts of England at the present moment. Besides, it is well at times to have a sample of the intellectual gladiator-

and wandering eye" espied among the phalanx of judges at South Kensington last July? If so, the less said about it the better just now when so many distinguished personages, political and other, are missing. Talk about too many cooks spoiling the broth!—but that is hardly worth mentioning contrasted with the awful number of show Roses—Teas or others—that are stood over or sat upon by a phalanx of judges. Phalanxes and societies are rather prone to slide into the easy philosophy tersely defined in the phrase that "Whatever is—is right." Let any one suggest change—hint at improvement—no weapons of banter, ridicule, misrepresentation, can be too sharp to silence, hunt down, or crush him. Express a doubt whether Rose showing ought to be the be-all and the end-all of Rose culture, and

evidently quite new to him, as indeed might have been expected. For every one of the phalanx—of course the mass as against one would carry all such matters with a rush—have little or no room for individual differences of opinion.

And as to "exeunt Teas," the whole tenor of my articles went to show that Tea Roses are too good to compete with any other class but their own, and it would be as logical to write "exeunt hunters" over an agricultural exhibition because these were not allowed to compete with earthenware, as "exeunt Teas" anent an article advocating that Teas should only compete with their peers. For just as it would be scant honour and little proof of special merit for racers or hunters to win 1st honours in an open class for horses, so it would be a lower degree of honour to perpetuals

to be carried to the front on the backs of Teas. By separating the classes a useful stimulus is given to the development of the special merits of each. Neither with the rapid increase and improvement of Teas would there be much difficulty in filling the larger classes were this desirable, which many might be disposed to doubt. Few practical rosarians, however, can have any doubt that the class composition of Roses would prove the likeliest method of making the best Roses yet better—that is, improving the quality of each class, and also increasing their numbers.

As to Rose shows out of season, and other matters galloped over on your correspondent's hobby-horse, it seems needless to remind such writers that there are other and more natural and enjoyable modes and places for looking at Roses than through the mere show spectacles of exhibitors, jurors, and societies—all more or less bent on making Roses pay their way. This is all very well so long as Rose showing is not valued merely for its profits or honours, or spectacular effect, but for the stimulus it affords to the higher culture, fuller fragrance, and more durable beauty of the Rose in the garden.

It may suit "T. W. G." and others to crowd the beauty of the Rose into the three or, at the most, six weeks in the latter end of June and the beginning of July. Thus seizing the Rose season at the flood, they may reap such fortunes as Rose showing at fever heat may afford; and it is small marvel that, jaded and wearied with the excitement, they welcome this new love of Dahlias and Gladioli; or, when showing ceases, they rush out of their gardens to the sea or the North. But far different is the feeling and the practice of the true lover of the Rose; he is so enamoured of her charms that he wishes to sit at Queen Rose's feet all the year round; hence his advocacy of those shows out of season, as likely to create and multiply ever-blooming varieties and of warm walls and greenhouses to shelter them, and of hot-houses to force them, so that in the future each month and each day of the month may be garlanded with the beauty, and sweetened and enriched by the fragrance of Roses.

Past experience justifies such glowing prospects in the near future. The possibilities and power of the Rose are by no means exhausted; and, notwithstanding the hater and rebuffs our suggestions towards improvement have been received by "T. W. G.," we venture to summon the National Rose Society to higher, better work, than the holding of a few great shows in the Rose season—because they pay. If the latter only is taken into account, what do subscribers pay their guineas and half-guineas for? This Society ought to be first in any good work among Roses; and one of those most needed at the present time is the multiplication and classification of ever-blooming Roses, Teas or others. And then great help would be given to Rose culture could remedies be discovered, tested, and published in the *Year Book*, or through other channels, for milder, red-rust, the influence of different stocks on the constitution, hardiness, and longevity of Roses; also upon growth and floriferousness, earliness, lateness, or continuity of blooming; worked Roses versus own root ones; in their relation to the size, colour, substance, and staying properties of their blooms; effects of different manures and other products, on Rose plants; the future of Tea Roses in relation to other classes, &c.

Surely these and such-like subjects are far more worthy the attention of the National Rose Society than the holding of a few monster shows in different centres, and the distribution of liberal money and cup prizes—in which matters they have now almost any number of successful competitors. These things the National Rose Society ought to have done, and not leave the weighty matters relating to the improved health, enhanced beauty, and ever-blooming possibilities of the Rose, undone. D. T. F.

Orchid Notes and Cleanings.

CATLEYA MEASURESH, n. *hyb. nat.*!

MR. J. O'BRIEN has kindly sent me a good flower, and a photograph of the plant possessed by Mr. R. H. Measures, Woodlands, Streatham, imported by Mr. F. Sander. The plant forms a dense mass, well compared by Mr. J. O'Brien with *Catleya calumata*. Unluckily I have no scale with which to judge the dimensions. At all events, the bulbs appear longer and much more swollen than those of *Catleya Aclandiae*. There are nearly always two leaves to each bulb, and the wonderfully developed roots confer full honour to their grower, Mr. J. Salter. The flower is equal to that of a good

Catleya Aclandiae. It has its texture and its sheen, and its general outline. Sepals and petals ligulate acute, petals a little undulate, reddish-brown, self-coloured. The side lacinia of the lip form a blunt angle, bearing a small point in the middle, involved at superior part; isthmus nearly none, anterior blade nearly heart-shaped, emarginate in front. There are indications of three almost obscure keels on the disc between the side lacinia. The whole colour is light whitish-rose. Column narrower than in *C. Aclandiae*, purple at top, rose at the base. And the parents? No doubt *C. Aclandiae* is in the play. Mr. J. O'Brien thinks of *C. Walteriana*. H. G. Rehb. f.

CYPRIPEDIUM PORPHYREUM, *Rehb. f.*

MR. DREWETT O. DREWETT, Kidding Mill-on-Tyne, has raised a fresh stock of this, bearing narrower fracts and l shorter petals, just as they were in the first flowers sent by Messrs. J. Veitch & Sons, though later other plants proved to have longer petals. It might, therefore, be better to keep the plants of Mr. D. D. Drewett as *Cypridium porphyreum*, Mr. D. D. Drewett's variety. H. G. Rehb. f.

CYPRIPEDIUM CARDINALE x, *Rehb. f.*

MR. DREWETT O. DREWETT, RIDING Mill-on-Tyne, has raised a fine stock of this, several flowers giving evidence of the great variety of individuals. This is very often the case in hybrids, so much that an accurate diagnosis is often impossible. Amateurs might keep this in memory and not get offended, if a published representation does not quite agree with the original description. The flowers of our plant look rather bold by their nearly spread petals. To my taste the finest are those, which have the involved parts of the lip on each side of the mouth with red stripes on white ground. The first flowers, sent in September, 1882, by Mr. Harry Veitch, had their spots, now and then in rows. It might perhaps be safer to keep those first Cardinals apart. H. G. Rehb. f.

MASDEVALLIA ACROCHORDONIA, *Rehb. f.*

At last this fine plant has flowered. I have at hand a flower, kindly sent me by Mr. James O'Brien, of a plant imported by Mr. F. Sander, and grown in the garden of Sydney Courtauld, Esq., Bocking Place, Braintree. It is very easily distinguished from *Masdevallia ephippium* (*Trochilus*) by its narrower lateral sepals, which have not so boldly inflated cheeks as in that one. The petals, which are retuse and lobed or bidentate in *Masdevallia ephippium*, are acuminate in this, and the spreading angle at base is very strong in our plant, scarcely indigitated in *Masdevallia ephippium*. I feel surprised that the keels and warts inside lateral sepals are not well developed. Yet the flower would appear to be the *debit* of the plant, that, no doubt, will improve considerably. If I am entitled to judge from herbarium materials I might say *Masdevallias* were such Orchids which bear their wild sisters when well treated in our conservatories. H. G. Rehb. f.

The Flower Garden.

TENDER PLANTS.

It is not safe to risk out-of-doors any plants which it is desirable to preserve for another season, and any which it is intended to preserve should be lifted and potted forthwith. Where it is found desirable to lift silver, bronze, or tricolor Pelargoniums, lift them carefully with a fork or spade, and avoid straining their roots. Trim off some of the strongest roots, and remove some of the foliage, leaving the leaf-stalk until they drop off of their own accord. Pot singly in 4-inch pots, and give no water; they will winter in a dormant state, and, if necessary, can be pushed forward in heat to supply cuttings in spring. Where early bloom is desirable, a large proportion of the Pelargoniums should be lifted from the beds and similarly treated. They will flower more profusely than autumn-struck cuttings, and can be wintered with very little trouble or loss. Dryness at the root during winter will be found the best means to pursue of preserving them in good order, and they may be packed closely together in boxes. Remove a large proportion of their foliage. They can be potted in the spring into 4 or 5 inch pots, and placed in a

viery or Peach-house at work. Where convenient, this will be found a good system to carry out. Carpet-bedders have lost none of their effectiveness, notwithstanding the boisterous weather we have experienced during the last ten days. Although the weather has been rough the temperature has ruled high for the season. All plants which have been rooted in boxes out-of-doors should now be placed under a glass shelter of some kind until such time as they can be placed in their winter quarters, which may not be convenient just yet. Dahlias may be kept gay for some time to come by picking off the decayed seed-pods and overblown flowers.

HARDY FLOWERS.

Chrysanthemums against walls or other shelters should be securely fastened to keep them from getting damaged by wind. They will materially assist the cut flower supply at this, the worst season of the year for flowers. Violets in pits should now have the sashes put over them every night, but they should be tilted slightly to prevent a stagnant atmosphere and the accumulation of moisture. Pick off all runners as they appear, and all decayed foliage. Remove the sashes off the pits during dry weather, but replace them immediately it commences to rain, but never replace them unless it freezes.

ALPINE PLANTS.

Those in pots should now be secured from excess of moisture, but they should receive all the air possible to maintain them in a robust state to meet the winter. See that none of the pots are standing under drip. These interesting subjects may be made to play a prominent feature, even in winter quarters, if a little rock-work can be introduced into the pit, as many of them are evergreen, and show well amongst lime or sandstone rocks.

Auriculas in pots must have careful attention in the application of water; they should never be watered until they really require it; then give sufficient to moisten the whole ball thoroughly. See that aphides do not obtain a lodgment in the young leaves; fumigate on the first appearance of the insects. Blosbam's new patent fumigator supplies a ready means of dealing with individual plants. A few puffs from this ingenious contrivance completely destroys the enemy, and saves much Tobacco. By using it the dry atmosphere produced by filling a whole house with Tobacco fumes is dispensed with. W. M. Baillie, Luton Hoop Gardens.

THE ORCHID HOUSES.

MISCELLANEOUS ORCHIDS.

If I had but one house in which to grow Orchids, and desired to collect the greatest number of species and varieties that would thrive under the same conditions, I should decide to have what is termed here the Lycopaste-house, which has a temperature intermediate between that of the *Catleyas* and the cool *O. ontoglossum* houses, but in which the atmosphere is quite as moist as in the latter. The fire-heat is kept going a little longer in spring than is requisite in cool houses. During summer the valves of the flow-pipe are turned off, leaving those in the return open; and being connected with warm houses the water circulates a little in the pipes. When it is necessary to drive the fires a little, the bottom ventilators are kept open more or less from early morning till late in the evening, while the temperature keeps at 58° to 60°, and are left open all night and during the day when the weather is warm. The top ventilators are used when the temperature rises over 62°. The same kind of shading is used as for *Catleyas*. From now until spring I like to see the night temperature about 55°, never below 50°. It may be of use to some if I mention several Orchids that grow in this house which are often treated that more or less heat is—*Lycastes*, *Sobralias*, *Dendrobium Falconeri*, *D. F. giganteum*, *Cymbidium Hookerianum*, *C. Lowianum*, *C. giganteum*, *C. devonianum*, *C. Mastersii*, *C. sinensis*; *Epidendrum vitellinum majus*, *E. erectum*, *E. variegatum*, *E. Frederici Guillemi*, *E. prismatocarpum*, *E. scepterum*, *E. ciniferum*; *Oncidium incurvum*, *O. ornithorhynchum*, *O. cheirophorum*, *O. pumilum*, *O. aurissum*, *O. tigrinum*, *O. zebrium*, *O. varicosum*, *O. Warnerianum*, *O. Wentworthianum*. *Trichopilis* and *Plinnum* grow best with us in this temperature; also

Angoula Clowesii, A. eburneum, A. Ruckeri, A. R. sanguineum, A. reifiora. These last do best in this house through the growing season, and a little warmer and drier when at rest. A plant of *Colymbine cristata* was kept in this house for two years, but did not flower so freely as those grown in the Cattleya or Dendrobium-house. Among other plants are *Crologyne barbata*, *Trichosma suavis*, *Odontoglossum grande*, *O. Inseleyi* and vars., *O. Oerstedii*, *O. Kramerii*, *O. bicondense*, *O. Uro-Skinneri*, *O. coronarium*; *Cypripedium Schlimi*, *C. purpuratum*, *C. venustum*, *C. insigne*; *Phaius Blumei*, *P. Wallichii*, *P. grandiflora*; *Bletia hyacinthina*, *Maxillaria Sanderiana*, *M. grandiflora*; *Zygopetalum crinitum*, *Z. Mackayi*, *Z. Clajii*; *Cattleya citrina*, &c. There are many other Orchids which I believe would grow in this house if placed in different positions, such as *Cattleya Trianae*, *C. Percivaliana*, *Odontoglossum vexillarium*, *O. crispum*, &c.

GENERAL DIRECTIONS.

All shading can now be removed, and advantage taken of dry days to stow away blinds. Mr. B. S. Williams' "Eureka" is a very convenient shading for many Orchids, as it can be made thinner as the season advances by drawing a hair-broom over the glass when rain is falling. I do not think that leaving blinds on to let down at night through the winter pays for the trouble. My experience is that in very severe weather it often reverses the day and night temperatures, or at any rate causes the latter to rise too much. What little sun-heat we get now will do good in all the houses; any recently potted or tender plants that cannot be placed in a shady corner, may require a little temporary shading, such as a piece of light paper laid over them. The position in which cool houses are placed will make some weeks difference in the time when shading can be dispensed with. I think the safest way to prepare warm Orchids to withstand the winter is to induce them to finish their growth instead of lowering the temperature too early in the autumn with the idea of getting them used to cold weather; this often injures plants before winter arrives.

Where *Masdevallias* of the *Chimæra* section have been grown during summer in the cool house they should be returned to the warm house now, placing the plants where they will get the least amount of sun. *M. tovarense* we keep in the cool-house at all seasons, where the temperature is seldom below 50°. At one time I thought by leaving the old spikes on the plant these would be the means of my getting more flower, but there appears to be nothing gained by doing so. The plants have a better appearance when these are cut off, and I think it might be a strain on them if they had to support the old flower-spikes from one season to another. If there is much condensed moisture on the plants in the cool-house in the morning do no damping down until this has dried off, but begin giving air as soon as the temperature in the house can be kept over 50°. *C. Woolfordi*, *Dorsside*, *Leatherhead*.

PLANTS AND THEIR CULTURE.

THE GREENHOUSE.

If due regard has been paid to the working up of a good stock of soft-wooded subjects, viz., *Tree Carnations* and others, winter-flowering *Pinks*, *Mignonette*, *Cinerarias*, *Heliotropes*, *Salvias*, *Godetias*, *Petunias*, *Euphorbias*, *Solanums*, &c., there will be no lack of free-blooming plants in the cool-house, as well as for furnishing purposes, for some months to come.

To have plants in flower in succession, a portion should be placed in a light, warm pit; others should be plunged in airy, heated pits, but kept cold; but heat must be applied if sharp frost should occur. *Calla æthiopica* is always acceptable, but more especially about Christmas-tide; if a good stock has been potted up the largest crowns should be selected as the first batch to be started. Few plants will stand more heat than these, and even in the plant-stove they are quite at home; and if the room near the glass is limited in the forcing-house they will come on nearly as well placed on the floor if plenty of heat and moisture are afforded, especially at the roots. The double varieties of Ivy-leaf *Pergoliums* will be very useful from this time forward for all purposes, and always when grown in baskets. *Begonias* of all winter-flowering species, such as *Digswelliana*, *Dregii*, *fuchsoides*, *hydrocotylifolia*, *wel-*

toniensis, *nitida alba*, and *multiflora*, are among the best to give a continuous supply of bloom. Push on with the training of *Trachelospermum jasminoides*, *Azaleas*, early varieties of *Ericas*, *Aphelaxis*, and *Genetyllis*; with a soft spongy clean *Camellias* before the bloom gets far advanced, and even if no insects should be infesting them they will be benefited by being cleaned of the dirt that accumulates on the foliage. *Agaves*, *Beaucarneas*, *Yuccas*, and *Dasyliroids* should now be arranged together on a side stage, to be well seen; these will require but little water during the winter months. Any plants infested with scale should be well cleaned, and when once all the older insects are dislodged a few syringings with lime water kills the young ones. Plants which have done service outside, and have got injured by wind or other agency, should have the damaged parts cut off, and be placed in a house possessing a little warmth, when they will form growth that will make up to a certain extent for that which was cut away. Care must be exercised not to cause damp in greenhouses during dull weather, else the bloom will damp off very quickly. Keep a look-out for mildew on all plants, especially those of a hard woody nature, and dust at once with sulphur if it be seen. *A. Evans*, *Lythe Hill*.

FRUITS UNDER GLASS.

P I N E S .

FRUITING plants when moderately dry should receive liberal supplies of warm liquid manure at the roots, and should have a night temperature of 70°, and 75° to 80° by day with fire-heat; running it up 10° higher with sun heat. Damp the paths and walls and the plunging material with tepid water mornings and afternoons on bright days at shutting-up time.

FRUITERS OF 1887.

These should be examined every ten days or a fortnight to ascertain the condition of the soil, and if any are dry, sufficient weak liquid manure, at a temperature as high as that of the bed, must be given to moisten the soil. Although the soil in the pots should be kept on the side of dryness during the winter months, it should, however, be borne in mind that it should not be allowed to remain dry long enough to cause the leaves to become flabby, as that would cause injury to them. Let the night temperature range from 60° to 55° according as the weather is mild or cold during the next eight weeks, and 65° by fire-heat during the day, and 10° higher with sun-heat, giving plenty of air during sunny parts of the day; the object being to prevent the plants from making growth between this and the time of their "showing" fruit next February, as well as to secure a sturdy growth in the plants. Sucker plants may be kept a few degrees warmer both day and night for a few more weeks. *H. W. Ward*, *Longford Castle*.

HARDY FRUIT GARDEN.

PLANTING.

WHERE the planting of fruit trees is contemplated next month the ground to receive them, if not finished, should be in a forward state of preparation. It is important that the trees be planted as quickly as possible after arriving from the nursery, or from whatever source they are obtained, and it is seldom that the soil is not in a fit state to receive them, providing the planting is carried out in good time next month. In planting, the small fibres should be well spread out on an even surface, and the main strong roots shortened with a sharp knife, any injured part being cut away. Burying coarse, bruised roots is oftentimes the cause of suckers springing up, diverting the energies of the trees. It is a good plan when planting in a heavy loamy soil to place a few shovelfuls of light fine soil immediately over the roots when the tree is placed in position, as such can be more easily worked amongst the fibrous roots, to the great advantage of the trees. After trees are planted at the base of walls, care must be taken that they do not become "hung up" by being nailed to the wall too early. Young trees are best tied to stakes fixed at the base of the walls until the spring, when they can be nailed to the wall in the ordinary way. Pyramid and standard trees should be securely staked before any rocking takes

place, placing some soft material around the stems of the trees to prevent injury to the bark by rubbing. When planting a new garden with fruit trees, or new trees into fresh positions in old gardens, judgment is requisite in the way of arrangement. Conical pyramids and cordons judiciously planted and maintained at a proper size and height, add much to the good appearance of a kitchen garden; when planting in single rows on each side of the walks, a narrow border should be properly prepared for the trees to grow in. These should be planted sufficiently close, so that ultimately, when the trees have reached their allotted size, the border be fully occupied; and at no time during their growth should any other subjects be planted in the border, that is, if first-class produce is desired. Vegetable cropping at the base of fruit trees planted in such positions cannot be too strongly condemned. The ground at the base of the trees should be either mulched or kept clean by the frequent use of the hoe. Proceed with lifting and root-pruning as fast as time and the labour at command will admit of; also plant fresh bush fruit and renovate old trees by working in some fresh soil and manure, which the roots will quickly make use of. As soon as the leaves on Peach and Nectarine trees part freely from the wood when touched, they should be gone over with a light brush; afterwards the leaves raked off the border and removed. *C. H. Richards*, *Somerley, Ringswood*.

The Kitchen Garden.

HEATED FRAMES AND PITS.

AFTER this date the supply of Cucumbers will be derived from the plants grown in pits and houses heated by hot water, and will require additional fire-heat, therefore maintain a night temperature of 60°, with a rise of 10° by day. A little air should be allowed at all times, except in very cold weather, and an moderately moist atmosphere must be kept up by damping the paths and side walls several times throughout the day. Whenever the plants become dry syringe freely with tepid water early in the afternoon, and also give plenty at the roots diluted with manure and soft water; an occasional sprinkling of Peruvian guano applied to the surface of the bed and afterwards watered in, will also be found an excellent fertiliser. Keep the shoots stopped and tied down to the trellis, removing all old decayed foliage, and also the fruit where too thickly placed. The structure should be kept thoroughly sweet and clean by having the glass washed and the walls lime-washed occasionally. Should the bottom-heat be derived from hot-water pipes placed underneath the beds, this should be examined daily, and the heat turned on in sufficient amount to maintain a steady bottom-heat of 60°.

FRENCH BEANS.

Those coming into bloom will require a higher temperature than they have hitherto enjoyed, and all successional batches should be removed into heated pits or houses, placed in positions near the glass, and a temperature of 65° at night can be obtained. Air should be given whenever the state of the weather will permit, avoiding cold draughts. Occasional applications with the syringe before and after blooming will be necessary, and will tend to keep the plants free from red-spider. Assistance to those in bearing should be given by watering with tepid liquid manure.

TOMATOS.

A warm dry temperature should be aimed at to ripen up and mature the crop of fruit now set; future growths can be stopped, and all late sown leaves and beds that are made up in the open will require to be well protected, and covered with at least a foot of straw litter, and some provision made to throw off and exclude wet. *John Austen*, *Witley Court Gardens*.

THE MUSHROOM-HOUSE.

A little fire-heat during dull, wet weather, with the ventilators open, will be very beneficial, but little moisture need be used at this season of the year, and when water has to be given to the beds it should be applied sparingly, especially so where newly made beds are showing; those recently spawned must not be allowed to cool too quickly, and where this is feared the beds should have a covering of hay, litter, or mats placed on them, with the object of retaining and prolonging an equable temperature of about 90° of heat. For successional beds more dry horse-droppings should be collected in an open, airy shed, spread out thinly, and turned over daily for a fortnight, when it will be in a fit state to use. Beds that are made up in the open will require to be well protected, and covered with at least a foot of straw litter, and some provision made to throw off and exclude wet. *John Austen*, *Witley Court Gardens*.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Oct 25	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Sale of Dutch Bulbs, at Stevens' Rooms. Royal Horticultural Society: Meeting of the Fruit and Floral Committee, at 11 A.M.; and Show of Chrysanthemums and Vegetables (two days). Sale of Orchids in Flower, at Frotheroe & Morris' Rooms.
TUESDAY,	Oct 26	Sale of Nursery stock, at Colbett's Nursery, Woking (three days). Sale of Dutch Bulbs, Plants, &c., at Stevens' Rooms. Show of the National Chrysanthemum Society, at the Royal Aquarium, Westminster.
WEDNESDAY,	Oct 27	Sale of Ferns and Greenhouse Plants and Dutch Bulbs, at Stevens' Rooms. Sale of Plants, at Frotheroe & Morris' Rooms.
THURSDAY,	Oct 28	Sale of Imported and Established Orchids, at Stevens' Rooms. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
FRIDAY,	Oct 29	Sale of Imported and Established Orchids, at Frotheroe & Morris' Rooms.
SATURDAY,	Oct 30	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Sale of Dutch Bulbs, at Stevens' Rooms.

THE discussion on SEEDLING FIGS, which has excited so much interest on the part of some of our readers, originated from the publication in these columns of an abstract by Mr. HEMSLEY of the researches of Count SOLMS LAUBACH (see *Gardeners' Chronicle*, April 28, 1883). We need not now enter upon details which have been already frequently repeated, and need only make passing allusion to the interesting statements to be found in PLINY'S *Natural History*, lib. xv., cap. xix., and to the account given by TOURNEFORT, in his *Relation du Voyage de Levant*, ii., 23 (1717). The more modern investigations of GASPARRINI, SOLMS LAUBACH, and HERMANN MÜLLER have already been summarised, so that it may suffice now to say that there is a wild Fig or "Caprifig," the fruits of which are not eatable, and a cultivated Fig assuming many forms and varieties, but all producing edible fruit. The so-called fruit of the Fig is the succulent and hollow end of a branch or shoot, the cavity of which is lined with a vast multitude of minute flowers, each raised on a short stalk. Some of these flowers are male, producing stamens only, others are female, producing each a single pistil. Male flowers and female flowers occasionally occur in the same fruit, but it is more commonly the case that the fruit contains flowers of one sex only. If both sexes are exceptionally present one is in an imperfect or rudimentary condition. Moreover, as is evident from an examination of the dried Figs of commerce, the shoot may swell and develop into a luscious Fig, while the contents, the so-called seeds, are not perfected at all, probably from not having been fertilised.

The Caprifig produces three crops of Figs in the year—the first in spring, the next in summer, and the last in autumn. The spring Figs produce usually no male flowers, the autumn Figs only a few, while the summer Figs produce an abundance of male as well as of female flowers. Fertilisation is effected by means of Fig-wasps (*Blastophaga grossorum*), which penetrate and deposit each one egg in one flower. As there are three kinds of generations of Figs, so there are three separate generations of Fig-wasps developed in them, only one generation, however, being concerned in the fertilisation of the Fig.

The whole history of the relation and interdependence of the three sets of Figs and of the three sets of insects is somewhat complicated, and may be read in the summary given in HERMANN MÜLLER'S *Fertilisation of Flowers*, translated by D'ARCY THOMPSON. The principal result is, that the Caprifig or wild Fig rarely sets a seed capable of germinating, its "fruit" being only of importance as supplying pollen to be conveyed by one brood of wasps to the female flowers of the Figs. The wild Figs then either wither on the trees, or fall off without becoming sweet. Hence it happens that in this country, where the wild Fig is not known, seedling Figs, the produce of seed actually

formed in this country, are exceedingly scarce. Up to the present time only two such cases have been recorded that can be considered free from doubt. But, of course, just as happens with Cucumbers, Hops, and diceous plants generally, it does sometimes happen, by exception, that flowers of both sexes are formed on one and the same branch; and supposing this to happen in a Fig, we might, in this way, get seedling Figs even in this country without the intervention of wild Figs or of fig-wasps. But, so far as we have observed, the Figs grown in this country do not produce male flowers at all, and seedling Figs are consequently in such cases impossible. In Southern Europe some authors describe the cultivated Fig as producing female flowers only, fertilisation being then dependent on the Caprifig and its tenant-wasps. In other cases there appear to be a few male flowers at the extreme upper part of the Fig. In such a case the flowers of the Fig might be fertilised by the pollen produced within the same Fig as themselves.

In referring to the literature of Fig culture in this country with reference to this question of home-grown seedlings, we accidentally lighted upon the following passage in the *Hotus Duravanti* of the late Mr. MASTERS, of Canterbury, published in 1831:—"The Roman Fig must be considered as a curiosity merely, it having been planted by that people against the south-east side of the fortification Regubium, now Reculver, where it still grows in a wild state, and occasionally produces a fruit that attains perfection." The Reculver Fig is well known to men of Kent and to antiquaries, and accordingly we addressed ourselves to Mr. ROACH SMITH to know whether his *Retrospections* (of which he has lately given to the world a second and very interesting volume) extended to this famous Fig. In reply to our inquiries, Mr. ROACH SMITH kindly tells us "that he attaches no value to the assertion that [the Reculver Fig] is of Roman origin. The place was a stronghold of ecclesiastics in the Middle Ages, who no doubt introduced Fig trees." We shall revert to the Reculver Fig later on, but meantime we may fittingly allude to the statement that the Fig was introduced to this country by Cardinal POLE in the time of HENRY VIII. These very Fig trees are still in existence in the garden of Lambeth Palace. The trees, five in number, stand on the south side of the library, each having been planted in the middle of the wall space between the buttresses. The stems, which are now at a little distance from the wall, but at one time they may have stood close enough to have been trained to it, are about 1 foot in diameter at 2 feet from the ground—about the size, therefore, that a Fig tree might be expected to attain in eighty years, or about the period which has elapsed since they were cut off by frost in 1813. It is probable that that was not the only occasion on which they suffered from the same cause, which will help to account for the distance at which they now stand from the wall: a strong sucker having been chosen the following year to take the place of the stem that had been killed in the previous winter, and which sucker might come up a short distance from it.

The trees at the present time measure about 24 feet in height, if measured from the apex to the foot of the stem, but do not appear so high owing to their inclination towards the south.

After hot summers a small crop of fruit, which is similar to the White Marseilles variety, is occasionally ripened. These Fig trees appear to be almost smoke-proof, and, next to the Ailantus, carry their foliage till late in the autumn, notwithstanding the unsalubrious surroundings of the Palace garden. There is evidence, however, that the Fig was cultivated in this country at a much earlier period, for MATTHEW PARIS, as quoted in FLUCKIGER and HAMBURY'S *Pharmacographia*, relates that the

year 1257 was so inclement that Apples and Pears were scarce in England, and that Figs, Cherries, and Plums totally failed to ripen.

Whether the Figs were introduced by the Romans, or whether they were introduced or re-introduced in later times by ecclesiastics, mindful of the Scriptural adage, "Whoso keepeth the Fig tree shall eat the fruit thereof," the time that has elapsed in either case is long enough to have allowed of some degeneration of the Fig as a consequence of our relatively ungenial climate, and possibly of some approach to the condition of the wild Fig.

Under this impression we recently sought and obtained, through the kindness of Mr. C. R. HAIG, a specimen of the Reculver Fig. This gentleman informs us that "the Fig tree is there [Reculver], on the old wall on the side farthest from the sea. From information I received, from the 'oldest inhabitant,' I found that the tree itself was cut down to the roots twelve or fourteen years ago, by the farmer tilling the adjacent land, the trees which are there now have all the appearance of being, and probably are, shoots from the old root. I send you leaves from the trees and two Figs, which might do for pickles, but which are the largest obtainable. I found also another Fig tree, or rather bush, against an old cottage which is the summer residence of Mr. KEMP. This tree, I am informed, is a cutting from the old tree. It has an ancient stump, and a profusion of shoots. . . . The 'oldest inhabitant' says the old tree is thousands of years old."

Our correspondent's surmise is, no doubt, correct—that all the trees he mentions had a common origin, as the leaves he sends correspond as nearly as Fig leaves (which are notoriously multiform) can be expected to do. But now for the crucial test. On cutting open the small Figs, only big enough, in our correspondent's opinion for the pickle-jar, we found not a single male flower. The Figs, indeed, were in so far precisely like the Lambeth Figs, and indeed all the other cultivated Figs we have examined. We conclude, therefore, that the Reculver Fig is no wild Fig, and that—at present, at any rate—it shows no signs of discarding the attributes of civilisation. Such a change would be more likely to show itself in seedling Figs; but, as we have shown, the Reculver Fig has in all probability not been propagated by seed, but by suckers or layers, and the existing trees are therefore the direct lineal continuations, without break of a single generation, of the Figs of the Middle Ages, and possibly of those of Roman times. How different this fixity of character from the state of things in ancient Italy, where, thanks to the Fig-wasps, the *cultures* of PLINY, the varieties and names of Fig trees were so numerous that, in the true spirit of an evolutionist, he thinks the species (as we should now call it) is undergoing a change. "Poster te sibi nomen atque genera, et rei hoc solum æstimantibus, appareat mutatum esse vitam" (lib. xv., § xviii.).

CAMPANULA PERSICIFOLIA.—Among border perennials there are few more striking than this old-fashioned species with its erect stems, lanceolate leaves, and erect spikes of numerous white or very pale blue flowers. There are numerous varieties of it, including a double-flowered variety, and a form in which the calyx becomes white like the corolla. All these are good, not only as garden decorations but also for cut flowers. The variety we now figure (fig. 105) was sent to us in the course of the summer, by Messrs. BACKHOUSE, of York, and it is sufficiently distinct to be called BACKHOUSE'S variety. The variety, as will be seen from our illustration, has much larger flowers than the ordinary forms (a flower of the real size is shown separately), and from its beauty and free-flowering property forms one of the most desirable of its class. Messrs. BACKHOUSE sent it to us under the manuscript name of *Campanula persicifolia alba grandiflora*, but we venture to think our appellation of BACKHOUSE'S variety will be sufficient to distinguish

FIG. 105.—*CAMPANULA PERSICIFOLIA*, BACKHOUSE'S VAR. : EARLY PERENNIAL : FLOWERS WHITE. (SEE P. 528.)

it. At any rate, if Messrs. BACKHOUSE prefer to give it their own name in their catalogues, there is no one to gainsay the privilege. By whatever name it be henceforth known, the plant is sure to become a favourite when generally known.

— **DOUBLE FLOWERS.**—Professor GOEBEL, of Rostock, has published some important observations on double flowers, in which he traces the formation of the several forms of double flowers from their earliest condition, and thus demonstrates their origin from branching or from multiplication of the petals.

— **BLACK SPOT ON CAMELLIA AND ORANGE LEAVES.**—This troublesome fungus, due sometimes to the presence of aphides and the honeydew that these insects secrete, but which will also grow without their intervention, can be got rid of by dusting with a mixture of sulphur and lime.

— **"THE ADVERTISERS' A.B.C."**—A serviceable book for those who advertise largely has been published under the above title by the London Central Agency for Advertisements, 402, Strand, W.C. It stands alone, so comprehensive is the book, containing as it does an almost complete list of all the London newspapers and journals, both daily and weekly, &c., and also of the provincial papers. More than this, the foreign and colonial newspapers are largely represented. There is also a classified index which is admirably complete, and in which the various papers may be found grouped under their towns of publication, their titles, or, again, according to their class of subject. Some idea of the extent of this section of the book may be grasped when it is made known that the index occupies about 300 pages quarto. But the most useful item as concerns advertisers is the information given concerning each paper or journal, &c.; this includes a full scale of charges for announcements, &c., price of the paper, and, in a side column, the publisher's own statement as to the class in which the journal circulates, the subject of the contents of the editorial columns, &c. Not the least interesting, if not useful, is an article on "Gigantic Advertising," in which the writer endeavours to show what is "Anti-Advertiser," and he alone, can do. This is embellished with such advertising pictures as every one who reads can scarcely avoid seeing in all our magazines, &c.

— **ORCHID FLOWERS.**—Professor PFITZER, of Heidelberg, has lately published, under the title *Morphologische Studien ueber die Orchidienbluete*, a companion volume to his previous work on the structure of the vegetative organs. In the present volume the Professor treats from a botanical point of view the peculiarities of conformation in Orchid flowers, such as the inferior ovary, the column, the spurs, and the lip. We shall have occasion to revert to this treatise on a future occasion.

— **GRASSLAND.**—Mr. BERNARD DYER has published in a separate form his paper on "The Maintenance and Renovation of Grassland," which we commend to the notice of our readers. The little pamphlet may be had of VINTON & CO., 9, New Bridge Street, Ludgate Circus, E.C.

— **ENTOMOLOGY.**—Dr. RILEY'S annual report as Entomologist to the United States Department of Agriculture, 1885, has lately been published. It contains elaborate papers on silk culture, articles on locusts, Strawberry weevils, Pear midges, bees, and numerous other insects injurious to cultivated plants, together with reports from various parts of the States as to the means found most effectual in preventing the ravages of insects or palliating their injurious effects.

— **"MARY'S MEADOW,"** AND SOME OF THE "LETTERS FROM A LITTLE GARDEN," by Mrs. EWING, have recently been published in book form by the Society for Promoting Christian Knowledge. These tales were originally published in *Aunt Fanny's Magazine*, where "Mary's Meadow" was so much appreciated that it was the cause of the foundation of the Parkinson Society. This Society took its name from JOHN PARKINSON'S *Paradise terrestis*, a book much quoted in "Mary's Meadow." The members undertake to prevent rare British wild flowers from being thoughtlessly exterminated, to exchange specimens, and to collect and comment upon the popular local and old-fashioned names borne by many flowers. Unfortunately, Mrs. EWING did not live long enough

to do more than start the Parkinson Society, this being almost the last of her writings for children. She was always a most popular writer, her tales and parables being appreciated by elder people quite as much as they were by the children for whom they were specially intended. Many therefore will be interested to know that this story ("Mary's Meadow") can now be bought separately, and in a convenient shape and size.

— **MILDEW ON VINES.**—In France this disease is now combated by sulphate of copper (blue vitriol); three kilos (say, 6½ lb.) of copper sulphate in a hectolitre (22 gallons) of water are used in the form of spray.

— **PEAR CONFERENCE COMMITTEE.**—A meeting of this body was held at South Kensington on Wednesday last, to receive the report of the late Pear Congress as compiled and arranged by Mr. BARRON, the Secretary. Mr. JOHN LEE presided. After examining the various sections of the report, and making some suggestions as to the information desired, and discussing the most desirable price at which it should be published, some favouring the idea that it should be the published price, it was unanimously resolved that the Council of the Royal Horticultural Society be invited to publish the report as presented and agreed to by the committee. The delicate matter of remuneration to the Secretary, for the great labour bestowed on the compilation of the report, was left in the hands of the Chairman for the present, but the committee were unanimous in expression of opinion that Mr. BARRON'S services merited cordial recognition.

— **COLONIAL AND INDIAN EXHIBITION.**—On Friday, the 8th inst., a paper was read in the Conference Hall of the Colonial and Indian Exhibition, by Mr. E. B. BIGGAR, on the question of the "Flax-growing and Linen-manufacturing capabilities of Canada." Lieut.-General LOWRY, C.B., occupied the chair. After tracing the history of this industry from the time of the ancient Egyptians, showing the permanence of the linen trade and the vitality of the Flax plant, Mr. BIGGAR showed the remarkable fitness of the soil of Canada, especially of the great undeveloped North-West, for the growth of Flax. Three species of wild Flax were indigenous in the North-West, and both these and the cultivated Flax and Hemp grew luxuriantly. Hemp grows to the height of 12 feet, and the Flax seed grown here yields a greater proportion of linseed oil than any in the world, being 16 lb. to the bushel. An English capitalist lately started a linseed-oil mill at Winnipeg, and a large trade in oil and the manufacture of oil-cakes for cattle-feeding is likely to follow the preliminary shipments that have been made. Over 16,000 acres have been sown in Flax this year by the Russian Mennonites settled in Manitoba, and a ready market is found for the seed, but no use whatever has been made of the fibre, which is burnt up in this province owing to lack of machinery for scutching, &c. The fibre of the North-West is pronounced much better than that of Ontario, which has been considered the best on the continent. This year 1000 tons have been brought to Belfast, this being the first shipment for manufacturing purposes, and the fibre is spoken of as much superior to Russian. The question of working the fibre up at a profit in the North-West is now likely to be settled by the new scutching, rippling, and steeping machinery so successfully worked in France, Ireland, and the United States. Flax and tow to the value of over £2,000,000 are annually imported for our factories from Russia, where 3,000,000 acres of land are devoted to its cultivation. Flax will grow where the summers are too short for Wheat, and there are in the Canadian North-West 100,000,000 acres available for this industry beyond the Wheat growing region. Within the great "Wheat belt" it is found that Flax is a much more profitable crop with that which break in the soil in the first year of cultivation than Wheat or any grain, as it matures well on the "breaking." Mr. BIGGAR estimates that even if a single crop of Flax were grown only on the new soil as it is broken up, enough fibre could be produced within the "Wheat belt" alone to equal the supply of Russia for eighty years to come. Purchasers of raw fibre would find it easier to control their business and obtain a speedy delivery of their goods from Canada than from Russia. If the Flax industry were, therefore, encouraged in Canada, a vast new industry would be built up within the Empire, and the British

Flax market would not be subject to such vicissitudes as it has been in the past, whenever Russia has been at war.

— **THE FUCHSIA TREE IN THE ISLE OF MAN.**—Considerable interest has been expressed with regard to the fine specimen figured recently in our columns (p. 307, fig. 79). The plant is that commonly known as *F. coccinea*, but is more correctly called *F. magellanica*. The name of the house in the garden of which it is growing is Ballure, not Ballue, as stated inadvertently. Our illustration was taken from a photograph expressly taken for us by Mr. GEORGE PATTERSON, The Studio, Ramsey, Isle of Man, who experienced considerable difficulty in securing a good picture, owing to the position of the tree, but ultimately succeeded in securing a very characteristic picture of a very noteworthy plant. The tree is still (October 16) one mass of bloom, and the ground beneath is rich in colour from the fallen bloom.

— **LINNEAN SOCIETY.**—The first meeting of the session 1886-87 will be held on Thursday, November 4, 1886, at 8 P.M. precisely, when the following papers will be read:—1. "The Natural History of the genus *Doro*." By EDWARD C. BOUSFIELD, L.R.C.P. Lond. 2. "Berberidaceae japonice." By TOKUTAKA ITO. (Communicated by W. T. THISTELTON DYER, C.M.G., V.P.L.S.) 3. "On the genus *Lophopus*, with a Description and Remarks on a New Species from New South Wales." By STUART O. RIDLEY, F.L.S. Exhibitions by the President and others.

— **CANADIAN FRUIT AT SOUTH KENSINGTON.**—One of the most comprehensive displays of Canadian fruit ever made in Europe is now on view in the conservatory of the Colonial and Indian Exhibition. Contributions are made from every province of Canada, from Nova Scotia and New Brunswick to Quebec and Ontario, and even from Manitoba and British Columbia, the greater part of the exhibits having been collected, under the direction of the Canadian Government, by Professor WILLIAM SAUNDERS, of the Western University, London, Ontario, who has long taken a keen interest in Canadian fruit culture. From Ontario and Quebec excellent specimens are shown of the varieties of Apples mostly shipped to British markets, and the body, texture, and flavour of these must command general admiration. The Pears are noteworthy for size and colour; while an excellent display of vegetables, and even Canadian outdoor Grapes, is made. The Nova Scotia display comprises some fifty varieties. The British Columbia and Manitoba varieties are also interesting, as coming from parts of the Dominion but little known in England for their fruit-growing capabilities. It is, moreover, important to note that the shipment of many of the early soft varieties of fruits now shown was made from Canada in refrigerators, and the perfect condition in which they arrived is considered to fully establish the value of this means of transit.

— **CHRYSANTHEMUMS AT FINSBURY PARK.**—Mr. COCHRANE, the Superintendent of this park, informs us that the annual display of Chrysanthemums in this park is now open to the public.

— **ROYAL JUBILEE EXHIBITION.**—Manchester is to have a great exhibition next year at Old Trafford, adjoining the Botanical Gardens, which will be incorporated with the exhibition. The space allotted covers 32 acres, and a guarantee fund of £132,000 has already been raised. The exhibits will be classified under the following heads:—1, Industrial design; 2, Machinery; 3, Handicrafts; 4, Works, Old Manchester, Ship Canal; 5, Fine Arts; 7, Electric Lighting, Music, Horticulture; 8, Finance and Audit. The Secretary is A. GILLES, Esq.; the General Manager, S. LEE BAFTY, Esq.; and the offices are at Albert Chambers, Albert Square, Manchester.

— **SINGAPORE.**—The report of the Superintendent of the Botanic Gardens for 1885 is devoted mainly to details of work done and progress made. The number of plants propagated for distribution is approximately 25,000. The most interesting information, however, for the general reader, is that contained in the appendix. This comprises a list of the economic plants, vegetables, &c., grown by the Malays, and of those introduced by Europeans. The *Choco* (*Secchium edule*) far surpasses all other Cucumbers grown in the Straits. Mr. CANTLEY

speaks highly of *Solanum nigrum* as a vegetable, though he utters a word of caution, as it is considered poisonous if eaten raw—"It has a bitter appetising taste, and is a vegetable one gets much attached to after a time." It is curious to read that Asparagus, Windsor Beans, Scarlet Runners, Cabbages, Broccoli, Scakale, Celery, Melons, Artichokes, and some other European vegetables cannot be cultivated with success, while others, such as Beet, Carrots, Cress, Leeks, Onions, Parsnips, Lettuce, Parsley, Radishes, Turnips, Tomatoes, and pot herbs, generally do well.

— GHEENT "CHAMBER SYNDICALE."—At a meeting held on the 11th inst. awards were made as follows:—

First-class Certificates.—To MM. Vervae & Co., for *Ondotoglossum crispum* var. *De Pachy*; and to MM. Desbois & Co., for *Calla aethiopica* fol. var.

Cultural Certificates.—To M. A. Lallière, for *Nepenthes Mastersii* var. *superba*; to MM. Vervae & Co., for *Ondotoglossum crispum*; and to M. Hye-lesgen, for *Cypripedium Ashburtonii*.

Commendations for the Flower.—To MM. Vervae & Co., for *Ondotoglossum* sp. and *O. grande*; to M. Desmet-Duvivier, for *Warszewiczia discolor*; and to MM. Boeles frères, for *Lalia Dayana* var.

Commendations for Novelty.—To Louis Desmet, père, for *Pear Mikado*, Japanese variety.

Commendations for Culture.—To M. B. Spaer, for *Adiantum cuneatum*.

— LIVERPOOL INTERNATIONAL EXHIBITION OF SHIPPING AND COMMERCE.—We have to announce that Messrs. SUTTON & SONS, seedsmen by Royal Warrants to Her Majesty the QUEEN and H.R.H. the Prince of WALES, Reading, have been awarded a Gold Medal for their extensive exhibits of seeds, grasses, &c., at this Exhibition. It will be remembered that they received a similar award at the recent provincial show of the Royal Horticultural Society.

— THE HAILSTORM NEAR PARIS.—We alluded in our last issue to the hailstorm which devastated the market gardens in the neighbourhood of Paris in August last, and which has caused a loss estimated at not less than 5,500,000 francs. The National Horticultural Society, 84, Rue de Grenelle, Paris, has opened a subscription for the benefit of the sufferers, and, moreover, proposes to form a Tombola, or lottery, on the 29th inst., at the Pavillon de la Ville, at the same time as the exhibition of the Society. The Society calls on its members to contribute donations for the Tombola in the form of flowers, fruit, tools, works of art, &c., to be drawn for, and the proceeds to be given to the fund. Money donations will be applied to the purchase of the articles exhibited. Donations of all kinds should be sent to the President of the National Society of Horticulture, Pavillon de la Ville, Champs Elysees, Paris, between October 20 and 25. M. ERNEST BERGMANN, well known to many of our English horticulturists, is one of the committee. Tickets for the lottery are priced at 50 centimes (4s.).

— FASCATED LILIUM AURATUM.—The Right Hon. J. CHAMBERLAIN sends from his garden at Birmingham a spike of this Lily with a flattened stem bearing no fewer than 119 flowers. It was grown in a 7-inch pot from a plant supplied by Mr. BULL. Mr. COOPER, the gardener, finds, as many others do, that the plants do well in *Rhododendron* beds, but that there is a great difference in the time of flowering, the earliest expanding in June, while others are not yet expanded.

— THE CARRIAGE BUILDING TRADE.—Recently, at a largely attended meeting of the members of the Institute of British Carriage Manufacturers, held in the Westminster Town Hall, Sir PHILIP CONLIFFE OWEN, who presided, distributed the awards made by the Council of the Institute to the successful competitors for the prize essays on the suspension of carriages, and the diplomas awarded at the Health Exhibition, 1885. Professor JOHN MACOUN, F.L.S., botanist to the Canadian Government, then read a paper on "Canadian Timbers Suitable for Carriage Building," during the course of which he said that New Brunswick, Quebec, and Ontario were the chief seats of the timber trade, and there was not a river in these three provinces where a saw log would float but what had its saw-mills or its lumbering firms. In Northern New Brunswick

there were still extensive forests of Maple, Beech, Ash, Bass-wood, Birch, Oak, Poplar, and Elm of very great size, besides large tracts covered with Hemlock, black and white Spruce, red and white Pine, as well as swamps of Larch and Cedar. Owing to their positions these forests remained untouched, and when a projected line of railway was built large supplies of timber for every branch of business would be laid open to commerce.

— CANADIAN APPLES AT EDINBURGH.—We learn that some 300 dishes of the Canadian Apples have, for lack of space at South Kensington, been sent on to Edinburgh, where, no doubt, they will be warmly received and carefully examined. So much colour as these Apples present may well arouse enthusiasm for fruit culture even in the bosoms of the cold, cautious Northerners.

— CORN EXCHANGE CHRYSANTHEMUM SHOW.—A show in aid of the Corn Exchange Benevolent Society is to be held on November 2 and 3, at the London Corn Exchange Hotel. The persons entitled to exhibit must be strictly amateur growers engaged in business in London, except in the 1st class, which is open to nurserymen. All the flowers placed in the room, whether for competition or otherwise, will be sold by auction at 4 P.M. on the second day of the show for the benefit of the aforesaid benevolent society, unless expressly reserved, and notice given to that effect before the show. The Society having been established for the laudable purpose of granting pensions and donations to distressed persons of either sex who have been connected with the London Corn trade generally, the committee anticipate a good show and a numerous attendance.

— NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.—The usual monthly meeting of this Association was held on Friday evening, the 15th inst., in the Christian Institute, Aberdeen. There was a large gathering of members, and the President, Mr. A. ROBSON, occupied the chair. Two papers were submitted to the meeting, the first being by Mr. D. M. SMITH, Argyle Place, Aberdeen, on "Chemical Manures." Mr. SMITH'S paper excited much interest, and considerable discussion followed the reading of it, at the close of which the writer was thanked. Mr. J. MORRISON, gardener, Waterton House, Burnburn, Aberdeenshire, read the next paper, the subject of which was "Bulbous and Tuberos-rooted Stove and Greenhouse Plants." Mr. MORRISON treated his subject in an interesting manner, and after a discussion had taken place, was thanked for his contribution. The usual vote of thanks to the President for his conduct in the chair terminated the proceedings.

— MALFORMED CORYLUS.—Through the kindness of the Director of the Royal Gardens, Kew, we have received specimens from M. VAN VOLXEM of Corylus Colurna, in which the two usually small bracteoles of the male flowers have expanded into leaves greatly resembling the involucre surrounding the nut. The appearance of the catkins is thus much altered. On a superficial examination there is a close resemblance between the cone of a Fir and the fruit-scale which in monostrous specimens may often be found divided into two leaf-like segments—a condition which has excited much attention on the part of those interested in the morphology of Conifers. M. VAN VOLXEM thinks the malformation in the Corylus may have originated from insect-injury. We have, however, not detected any insect, though we suspect the deformity may have been occasioned by a mite (*Phytoptus*). Against this view, however, is the fact that the production is merely an exaggeration of the normal condition, and not a new formation.

— GARDENING APPOINTMENTS.—Mr. D. A. BREMNER, late Foreman to W. WEST, Esq., Burcote, Faringdon, Berks, has been appointed Head Gardener to E. SALT, Esq., Fernhurst, Shipley.—GEORGE BASKETT, late Gardener to F. W. DOLMAN, Esq., Elm Croft, Dorset, has been appointed Head Gardener to the Right Hon. Lord PENZANCE, Eashing Park, Godalming.—Mr. A. BEECH, late Gardener at Wood Norton Hall, East Dereham, has been appointed Head Gardener to EDGAR HIBBERT, Esq., Ashby St. Ledger's Lodge, near Rugby, Northamptonshire.

The Apiary.

PREPARING FOR WINTER.

As the winter is now coming on bees must be immediately put into winter quarters. If there appears to be any chance of the bees running short of food you cannot do better than get some good sound brandy-balls, as recommended some time back in the *Gardeners' Chronicle* by Mrs. Long, of Sherrington Manor. To begin with our friends of the "skep." If the "skep" has a hole at the top put a nice little heap—say 1 lb.—of these brandy-balls carefully on the top, and cover all up with a few pieces of flannel or carpet; then put the cover on, and fasten all down to keep the wind from blowing the cover off. A huckle is a very easy one for the bees, and looks easy as well. The only thing to be said against a huckle is that mice find them comfortable also, and if the entrance is too large, so that they (the mice) could enter and partake of the honey and wax, their delight would be unbounded, as it is usually supposed that they prefer these articles to a tallow candle. Therefore look well to these things, for tallow is quite good enough for the best of mice. If your bar-framed hives are short of stores, uncover the frames, and put some brandy-balls just over the cluster; then cover up with two or three pieces of flannel or carpet, and then do not open the hive again till spring. When you are quite satisfied that the season for robbing has expired, you can open the entrances to their full length. You need not fancy that the bees will catch cold; they would be much healthier with the entrances fully open than closed. Bees can stand cold far better than they can damp, therefore do all you can to admit the air into the hives. Should one or two warm days come, and the bees begin to rob, close up the entrances at once, so that only one bee can pass at a time. Directly the weather changes to cold again the entrances could be again opened to their full width. See that all the roofs are water-tight, and if they are not, then immediately make them so. See, too, that there is no chance of their being blown off. That would be disastrous if it happened in the night. If your hives stand on their own legs, a piece of thick tared string tied all round would effectually secure the roofs. If you have hives which stand on the ground, or on some level surface, your own intelligence will suggest some method of fastening the roofs on, but do not leave them to chance. Having done all these things, you can safely let things alone out-of-doors, *i.e.*, as far as the bees are concerned, and say adieu to them till the spring. Meanwhile, you can turn your attention to various things connected with your pets in lofts, and I hope this winter to be able to say many things which your readers will find very useful and practical. *Walter Chitty, Pwsey.*

Notices of Books.

The Law of Allotments: being a Treatise on the Law relating to the Allotment of Land for the Labouring Poor, &c. By T. Hall Hall, M.A. (Longmans.)

The title of this book amply suffices to explain its contents and might preclude the necessity of doing more than announce its publication, were it not that in fairness to the author we are bound to commend the clear and intelligible manner in which he has "laid down the law." How far the author would be supported by the judges in actual practice is a matter on which we could not presume to give an opinion. We note that as far back as 1873 there were 246,398 allotments in Great Britain, the area amounting to 59,631 acres, or about one quarter of an acre to each allotment, so that it is no new thing. We note that the rules of the Rothamsted Allotment Club are given in full—rules which have been found to work satisfactorily for many years. From the preface we learn that the book was originally intended to be incorporated with the Earl of Onslow's *Land-lots and Allotments*, but that idea was abandoned when it was seen that the present treatise would be so large as to prevent the circulation of that useful little book among the classes for whom it was specially intended. Mr. Hall deals with the legislation on the subject, the conditions of letting, the

determination of tenancy the rights of the tenants and of the landlords, and gives numerous illustrations of the forms of agreement and other documents relating to the subject.

The Construction of Silos and the Compression of Green Crops for Silage. By Thomas Potter, Batsford, 52, High Holborn, W.C.

We must content ourselves in these pages by indicating the nature of the contents of this volume. It treats of the construction of silos and the making of silage, in both of which points there seems to be much room for variation and differences of opinion. Mr. Potter gives numerous details which he hopes "may enable those who intend making silage to determine with respect to silos, silage-stacks, and means of compression what may best suit individual requirements."

School of Forest Engineers in Spain indicative of a Type for a British National School of Forestry. By J. C. Brown, LL.D. Edinburgh: Oliver & Boyd.

The unwearied exertions of Dr. Brown in the cause of forestry have now led to the publication of a volume—a companion to the many he has already issued—and devoted to making known the regulations of the Forest School of Spain as a model for similar institutions in the colonies. It seems strange and not very gratifying to our self-complacency, that we should have to go to Spain for such a model, but Spain has been wise enough to follow the lead of Germany, and to modify German practice according to Spanish needs. Dr. Brown gives a summary account of the training and tuition given in the Forest School of the Escorial. Special subjects, as resin production and cork-stripping, are treated of. In the latter part of his volume the author advocates the claims of Edinburgh as the site for a forest school, and sketches a scheme of instruction based on his researches and observations of forests and forest schools in many lands. Most of the schemes proposed are intended for the instruction and training of high-class officers, but in addition to that we think there is at least equal necessity for training foresters of lower grades, and this the great expense of ordinary forest schools necessarily precludes.

AJI-AJI, THE PEPPER OF PEPPERS.

OUR contemporary the *Saturday Review*, in its issue for September 18, had an article under the mysterious heading of "Aji-Aji," which the writer at once proceeded to explain was a "compound Quichuan word" for Pepper of Peppers, and further informed his readers that "both word and thing are largely distributed over South America," that "it is the finest of all Peppers. No other Pepper in either hemisphere competes with it, neither the Piper nigrum, nor the Capsicum baccatum, nor the C. frutescens, nor the C. annuum, nor yet the Eugenia pimenta. All these are varied merely in pungency, some being sharp and fiery, others caustic and stimulating, and some pricking and penetrating. But the refined and delicate Aji is persuasive and enticing, of not one flavour but many flavours; it never conceals, but, on the contrary, increases whatever of fragrance and sweetness of taste or smell it comes in contact with." The writer then proceeds to give a long list of its extraordinary virtues, and an enumeration of the articles of food it may be used to improve, from a new-laid egg to a Strawberry or a jug of mulled claret. It is said to prevent evil effects in a malarian atmosphere, and on this account we are told that "the War Department of the United States has secured a monopoly of all the Aji which is exported from South America," and further that "no Aji in these days finds its way to London, and that which we once enjoyed in the belief that it would never fail us has become nothing but a sigh and a regret. It remains to be seen," the writer continues, "whether the people who have acclimated the Cinchona trees in the Neillberries, in Ceylon, in Jamaica, and in Fiji will allow themselves to be deprived of their delicious and insipidating Aji."

Perhaps the most interesting part of the *Saturday Review's* article is that which treats of the preparation of Aji, which is as follows:—"There are two kinds of Aji, but there is only one way of preparing it. The

best is that which is made from the greatest variety of Peppers. The pods of these are taken when fresh, stripped of their seeds, and ground into a paste of the consistency of fresh spring butter. The paste is put into a small, well dried Gourd, prepared on purpose, of the size and shape of a well grown Orange. The Gourd, when thus charged, is then coated with a layer of well tempered clay, and placed in the sun to dry, or to ripen, as the simple people who prepare it say in their own tongue. By the time the clay is well baked the pulp or paste within has been dried into a fine yellow powder, and it is then fit for use. Many people, ignorant of this fine art of the Locas, have supposed quite naturally that these Aji-laden Gourds, with their exquisite flavour and refined taste, were some uncommon and little known natural fruits. The other method of preparing Aji is to grind the seeds with the pods, which simply adds great pungency to the Pepper, and is always used in the preparation of Maize or Indian Corn, which is boiled in its own husk with so much Aji, and surpasses in flavour and pleasantness any vegetable curry of the East. The Gourds of Aji when thoroughly ripe are cleansed of their coating of clay, tied up in suitable leaves, well secured by the fibre of the Aloe, and which much resembles when ready for market reeves of large Onions, a dozen Gourds making up one reeve of Aji. The cost of these in the good old times was 15*s.* for a dozen Gourds; what the price may be now is only known on the Exchange."

From the references made in the preceding passage to the pods and seeds being ground to constitute the Pepper, it will be readily guessed that it is the produce of a species of Capsicum, notwithstanding that the writer of the article says it is "not the Capsicum baccatum, nor the C. frutescens, nor the C. annuum."

In the Kew Museum are numerous varieties of the fruits of Capsicum annuum, all bearing the name of Aji, and the museum also contains specimens of the small Gourds filled with Capsicum Pepper as described by our contemporary; so that the "Aji-Aji" of the *Saturday Review* is clearly the produce of Capsicum annuum. *John R. Jackson, Curator, Museum, Royal Gardens, Kew.*

TEA, COFFEE, AND CINCHONA INSECT PESTS.

THE ravages of insects on Tea, Coffee, and Cinchona plants of late years have been so widespread as to threaten serious consequences to those who own large plantations. It is, however, a curious fact that few have deemed the subject of sufficient importance to devote their time and attention to an intelligent investigation of these insect pests, their ways, habits, methods of attack, propagation, &c.; and it is therefore with sincere pleasure we have perused an interesting paper on pests of the homopterous family of Coccidae, which attack Tea, Cinchona, and Coffee plants, read by Mr. E. T. Atkinson, C.S., at a recent meeting of the Bengal Asiatic Society. Mr. Atkinson is not unknown to this branch of science, and his paper will doubtless give rise to a proper discussion of this subject.

The author stated that he sought to give such an account of this important family of insects as will induce observers to take up its study seriously. He went on to say that it comprises those insects known as scale-insects, or gall-insects, which are so harmful to the Coffee, Cinchona, Tea, and fruit trees generally. Nothing of value has yet been written regarding the species of this family that occur in India, with the exception of the Curcra laca that furnishes the lac and lac-dye which form such valuable articles of export from Calcutta. The family is distributed amongst the sub-families Diaspina, Brachysiphina, Lecanina, and Coccina, of which some hundreds of species have been described, but very few of which are recorded from India. The larval form of these insects, he said, has six legs, many jointed antennae, and a rostrum, or sucking apparatus; the adult female, as a rule, has neither wings, legs, nor antennae, but only a rostrum, while the adult male has two wings, legs, and antennae, but no rostrum, or mouth. Their forms vary from flat to spherical, many are covered with a white fibrous filamentary substance, others with a felted, waxy, mucous, and even calcareous substance. All are minute, and require much care in their manipulation and preservation. The author disclaimed all idea of purely

scientific aims in this popular introduction to the study of a much neglected group of great economical importance to residents in the East. His object was to collect facts on which hereafter to base a scientific examination of the species of these insects occurring in India.

After Mr. Atkinson's paper, the President of the Society brought to the notice of the meeting letters addressed to him by Mr. Green, of Pudukoya, in Ceylon, regarding a new pest belonging to the Homopterous family Coccidae, which is now committing great ravages on the Coffee plantations there, and in some cases compelling the abandonment of its cultivation.

Mr. Green writes:—"I have been led to pay some attention to the Homoptera of Ceylon, chiefly by reason of the fearful destruction caused by many of their number to agricultural products. I am now sending you, under separate cover, a few specimens of these insects. The parcel contains:—

"(a). A glass tube with Coffee leaves, on the under surface of which you will find a species of Lecanina. This has only lately appeared in Ceylon, but has already spread in an astonishing manner, and has caused inconceivable destruction in the Coffee districts. It is entirely distinct from *L. coffea* and *L. nigrum*, noticed by Mr. Neitner in his pamphlet on *The Coffee Tree and its Enemies*. Both these species I am familiarly acquainted with, though their ravages are now very slight compared to the work of the green insect now forwarded. I have not been able to obtain the male form, though both sexes of the other two are fairly common.

"(b). Cinchona twigs with a species of Coccus lying apparently beneath the cuticle of the bark, which is raised in the form of small blisters. This is a most extraordinary insect, and with closely allied species, which are numerous on other plants, has considerably perplexed me, especially as to the nature of the integument which covers it. In the specimens from Cinchona this would seem to be actually the cuticle of the bark, many of the incipient cracks extending right across the integument of the insect. Those ooz sent are all females. The male form closely resembles those in the tube containing spirits of wine. The larve and pupa are very similar to the species found on Tea leaves. The adult female has neither legs, antennae, nor eyes, the only external member being a fine sucking bristle (rostrum), which proceeds from a spot near the middle of the under surface. In the young all the members are complete.

"(c). Loranthus leaves with allied species of Coccus, also apparently lying beneath the cuticle of the leaf; but on examining the integument under the microscope with transmitted light, one finds no traces of cellular formation, nor any stomata, all of which, however, are complete in the tissues of the leaf immediately below the insect. Adhering to this integument, or forming part of it, are always one or more of the characteristic scales of the Coccidae, which would seem to be the cast skins of the insect. The young larva, after fixing itself to the leaf, soon exhibits the scaly covering on its posterior half, leaving the anterior part free. The scale is then shed, remaining in its place, and the insect lies freely beneath, and loses all its external members except the sucking bristle. The integument, under a high magnifying power, appears to be composed of an irregular network of sinuous intersecting filaments, with no trace of cellular formation.

"(d). A tube containing both sexes of another species, affecting the leaves of the Loranthus. The integument of the female is continuous with the woolly covering of the leaf. The males are minute red flies, with one pair of two-veined semi-hyaline wings, which at rest are folded straight down the back, completely overlapping each other. The antennae are very long and setaceous; anal extremity without filaments, but with a long central point. Both the upper and the under surface of the head appear to be furnished with a pair of eyes, and I can find no ocelli. The lower pair of eyes correspond to what is described by Neitner in his *Pseudococcus* as 'two black knobs, resembling blunted mandibles, representing the external mouth.' These two spots are present in the males of all this family, and I cannot help thinking that they have been erroneously described as mandibles, the external mouth, in my opinion, being present only as a minute spot between the anterior pair of legs, in the same position in which it is situate in the female." [Mr. Green is right in regarding these knobs as other than mandibles; they

are eyes.] "If the head of the insect be macerated in water, and examined with transmitted light, all four spots appear as colourless globules with two concentric dark rings, an appearance which would be given by the cornea of the eye."

Unfortunately most of these specimens suffered so much from damp in transit that they were useless for examination. In a subsequent letter from Mr. Green it is stated that "The green Lecanium has spread at an extraordinary rate, and we have in consequence been compelled to abandon a large acreage of Coffee and replant the ground with Tea. This species is vastly more destructive than anything of the kind that has previously been experienced. The ravages of *L. coffee* were nothing in comparison. It is curious that though they have been increasing so rapidly, there has been apparently no generation of male insects."

The foregoing facts are of sufficient importance to owners of plantations to induce them to devote more attention to the subject than hitherto appears to have been done, and by investigation to hit upon remedies in view to protecting their plantations from the ravages of these insect pests. *Indian Agriculturist, September 18.*

FRUIT REGISTER.

APPLE NANCY JACKSON.

We send you fruits of a North Yorkshire Apple called Nancy Jackson, which we suppose to be little known beyond the district. The fruits we send are part of a very heavy crop growing on a standard tree on sandy light soil, not particularly well suited for fruit growing. It is an unfailing bearer. *James Blackhouse & Son.* [A large cooking Apple of great excellence, keeping till May, and well worthy of cultivation anywhere. Ed.]

PEAR DOYENNÉ DE JUILLET.

An old Pear, small in size, pretty in form and colour, good in flavour, a good bearer, and one which ripens when Peaches are scarce, and when scarcely any other Pear is ripe. M. Durvenich, who describes and figures the Pear, says that it does not succeed on the Quince. *Bulletin d'Arboriculture, September, 1886.*

HONEY UNDER THE MICROSCOPE.

By an accident one day last month three sorts of honey were upon my table. The first may be called "shop honey," bought in London; the second was "Imported honey," sent as a present; the third pure country honey, brought from the village of Totternhoe, in Bedfordshire. In general appearance the three samples greatly differed from each other, and the difference in taste was equally marked. The taste of the pure village honey was quite distinct from the other two. My microscope being always at hand, I decided upon putting a fragment of each sample under a low power, so that any possible differences in appearance might be noted. London "shop honey" appeared as in fig. 106. The general syrup was full of crystals, probably of sugar, in each field of view about one pollen grain could be seen, as illustrated: there were traces and suggestions of somewhat unpleasant insect remains, and possibly pieces of defunct grubs. "Imported honey" (fig. 107) was similar with the last, but with about three times more pollen, and with crystals of larger size; insect traces and suggestions about the same as in the last. I could see no flour in either. Pure village honey was quite different from the two last, being free from sugar crystals, quite free from insect remains, and the whole syrup full of pollen grains and plant raphides or crystals, as illustrated in fig. 108.

Persons who consume "shop honey" only, must be quite unacquainted with the taste of true village honey, for the taste of one is in no way comparable with the other. Pure honey tastes like a smooth sweet nectar, whilst "shop honey" tastes rough, like sugared beeswax. I do not know how "shop honey" is made, but from its taste and appearance it may quite possibly be smashed-up honeycomb sweetened with sugar—possibly after the true honey has been withdrawn, a few defunct bees and grubs being squashed into the general mass.

The number of beautifully preserved pollen grains to

be seen floating in pure honey is marvellous. So well are the numerous grains preserved that it would be a very easy matter to name them and by thence to say what plants were frequented and what plants avoided by the bees. I have no opportunity at present for naming the grains, as the examination would require time. The great preponderance of grains belonging to the Leguminosae, especially to field Beans and Clover, is remarkable; the Ericaceae, as Heather, and the Onagraceae, as the evening Primrose, &c., are both well represented. The Composite appear to have but few bee visitors. For any one with

clear, viz., some London "shop" honey is suspicious and bad, whilst some pure village honey is uncommonly good. *Worthington G. Smith, Dunstable.*

HOME CORRESPONDENCE.

Artificially Ripened Pears.—About the middle of September I found that I was likely to have a break in the supply of dessert Pears in the early part of this month, and as I did not wish this to happen I took means to prevent its taking place. I picked a half-bushel basketful of large clean fruit of that excellent variety Marie Louise while quite dry, and placed them singly on a sheet of wadding in a box, then, having put another sheet of wadding over the first layer of Pears, another layer of the latter followed, and so on until the box was quite full, the wadding being used to exclude air. The box was then placed on the hot-water pipes in a late vinery. After it had been there for a week or ten days I examined the contents, and found, but not to my surprise, that the Pears had ripened beautifully, the fruit being full of flavour and more highly coloured—that is, of a clearer and deeper yellow than I have ever known them to be when ripened in a cool fruit-room. Since then I have treated several lots of Marie Louise, of which variety we have a large quantity, in the same manner, with the best results. Fruits of this variety which we have harvested this week are quite hard, as they will remain for some weeks longer. By this method the season of certain Pears or Apples fit for table may be prolonged; and when there happens to be a good supply of any variety of Pear, and they are allowed to ripen on the shelves in the ordinary way in the fruit-room, the fruit cannot all be used for dessert whilst good, consequently it must either be sold or otherwise disposed of, but which, by following the artificial process of ripening, could have been consumed weeks previously. *H. W. Ward, October 12.*

The Codin Moth.—The eggs of this moth are deposited singly on the apex of the ovary when the Apple is in flower or on the crown of the fruit later in the season; the caterpillar is hatched in a few days, and eats its way to the central portion of the ovary, and at first does not attack the covering which immediately protects the young seed. It prolongs its burrow until the rind of the fruit is pierced, forming a tortuous gallery by which air is admitted and excreta discharged. The caterpillar now returns to the core of the fruit, pierces the covering, and obtains access to the seed, upon which it feeds until the Apple falls, when it ascends the tree and enters the chrysalis state, which in the earlier part of the season is of short duration, the moth emerging to deposit its eggs as already described. The numbers of this destructive pest of the Apple tree may be lessened considerably by stripping or cutting off all loose bark on the stem and older limbs, and all moss or lichen should be scraped off, so as to afford the least possible shelter for the caterpillar after it leaves the fruit, and expose it for a longer time to the attacks of birds. The best period to destroy the insect is during the caterpillar stage, when advantage should be taken of its habit of climbing the stems of the trees. Bands of stout paper 5 inches wide are attached to the stem in such a way that the upper margin fits tightly all round, whilst the lower margin is sufficiently loose to allow the caterpillar to creep beneath it without difficulty. The insect readily takes possession of the shelter afforded by the band, and constructing a light web, passes into its dormant state. The bands should be examined once a week, and the caterpillars destroyed. All fallen fruit should be promptly collected and destroyed before the caterpillars have time to creep out. *M.*

Ivy-leaved Pelargoniums.—Pelargoniums of various sections have long been established favourites, and enthusiastic florists, gardeners, and nurserymen have bestowed much patience and skill in trying to produce flowers possessing qualities superior to those already in existence. How well they have succeeded in their endeavours may be best judged by comparing the splendid varieties now in existence with those of older types, and such perfection has been reached among the zonal and rosegay sections as to leave but little to be desired. But it is only within recent years that any great advance has been made in the Ivy-leaved kinds (*Pelargonium peltatum*), which are now richer in those soft and pleasing shades of pink and rose that find so many admirers. The training habit renders them most suitable for many kinds of floral embellishment that other Pelargoniums are not adapted for. We find them very useful, when grown in small pots, for drooping over the sides of stages or arranged in vases in conjunction with other plants for table decoration. Grown in baskets they are also very effective; their deep green glossy leaves and pretty flowers only require to be seen to be admired. Another excellent way of growing them

FIG. 106.—LONDON "SHOP" HONEY, ENLARGED 150 DIAM.

FIG. 107.—IMPORTED HONEY, ENLARGED 150 DIAM.

FIG. 108.—PURE ENGLISH VILLAGE HONEY, ENLARGED 100 DIAM., SHOWING POLLEN GRAINS OF VARIOUS KINDS AND RAPHAIDES.

the necessary time, the microscopic appearances belonging to different honeys would be a good subject for study, and one full of interest. The pollen grains are preserved in a marvellously perfect state.

I have before written in the *Gardeners' Chronicle* of ketchup under the microscope and Périgord pie under the microscope. Neither examination had a tendency to increase one's fondness for the abovementioned delicacies. The microscope does not increase one's attachment for "shop" honey. Are "shop" honey-bees fed anywhere on sugar instead of the sweet nectar of flowers?—do they never visit flowers and bring away pollen grains?—or is "shop" honey old broken-up combs or sweetened beeswax?—or what is it? To whatever cause the great differences in appearance and taste may be due one fact is

is to pot a few old plants into 8 or 10-inch pots, constructing a trellis of pyramidal form to train them to, and as soon as the plants have filled the allotted space allow them to flower. As they are rapid-growing subjects they can soon be grown into fine specimens, which will repay the labour that may have been bestowed upon them. In March and April we strike great numbers of them, which are grown on in cold pits till they are trained to their blooming pots of from 4 to 6 inches. They are then given a good open position out-of-doors, and as soon as the roots are plentiful the plants receive weak farmyard manure-water two or three times a week, and occasionally two or three pieces of nitrate of soda, about the size of Peas, are given to each pot; this is an excellent stimulant for all kinds of plants, but it requires to be used in small quantities, and approaches and there is danger from frost the plants are placed in frames till the winter quarters (a light span-roofed house) are ready for their reception. After they are placed in this structure they receive a temperature ranging between 55° and 65°, and a fair amount of air whenever the weather is favourable; the plants flower much more satisfactorily during the dull days of autumn when kept at this temperature than in one that is cooler. The plants are trained to a stick placed in the centre of each pot, while the shoots of others are allowed to droop over the sides of the pot, as it is always a good plan to have plants trained in various ways for decorative purposes. The soil used throughout consists of three parts turfy loam to one of decayed manure, with a little sharp sand added; moderately rich soil and firm potting being the important factors in producing well ripened flowering shoots. The following are all splendid varieties, and worthy a place in every garden:—*De Brazza*, light salmon; *Leonard d'Arc*, white, tinted with lavender; *Isidore Perle*, light rose; *Gloire d'Orleans*, crimson-magenta; *Comte de Horace de Choiseul*, *H. Dubou*, and *Comte de Horace de Choiseul*, *H. Dubou*.

Heavy Apples.—Noticing an answer in the *Gardeners' Chronicle*, on page 440, respecting a large Emperor Alexander Apple, that weighed 1 lb. 3 oz., you stated that was the heaviest on record, does that apply to the Emperor Alexander alone, or to other varieties as well? As I have this year gathered a specimen of Wainey's King, which weighed 20 oz. It is in circumference about 15 inches. *H. Kent*, *The Gardens, Tyntohamper Park, St. Albans*. [The weight given was that of Emperor Alexander Apple. Ed.]

Bees and Colour.—Surely "W. H. R.," at pp. 471 and 472 of this volume must have been writing without reflection when he said of bees that "it is their exquisite sense of smell alone that serves them in collecting honey, as is proved by their never visiting unmeliferous flowers of any hue." The Poppies are well known for their brilliant hues, but they produce no honey, and are frequently visited by bees and other insects for the pollen. The same statements apply to *Anemone angulosa* and the numerous varieties of *A. Hepatica*, while bees are recorded to have visited the equally unmeliferous *A. nemorosa* to suck the sap by piercing the base of the flower. The British Roses afford another instance of showy, more or less highly coloured and fragrant flowers, with a numerous array of stamens, but no honey. What, then, do bees visit them for if not for pollen? The showy flowers of Onions are fertilised by bees, but contain no honey, and Mueller has frequently observed male bees searching for nectar. There can be little question that showy coloured flowers are frequently visited by bees in search of honey, as I have often observed the latter in large open flowers rushing about in an uncertain manner evidently in quest of what was not there. If their exquisite sense of smell served in every instance to detect honey, why do bees alight on hundreds of flowers they do not enter at, or in other instances only enter half way, and then retreat? On the other hand, I have witnessed the humble bee collecting pollen from *Pedicularis sylvatica*, which produces honey. The manner of collecting was also singular. Alighting on the lower lip she quickly walked on to the side of the upper lip before inserting her proboscis between the anthers. A similar process is performed by the hive bee in collecting pollen from the numerous varieties of *Crocus vernus*. Alighting generally on the edge of the perianth she walks on to the stigma, or alights directly on the stigma, and, descending to the stamens, hurriedly dislodges the pollen which she collects anon by rubbing her hind legs over it while adhering to the stamens or the multifid stigma. At the same time I have witnessed humble bees collecting pollen dropped by the more powerful (because more numerous) rivals at the base of the expanded limb of the perianth, where it was retained by a set of hairs in the throat of the slender tube. These instances are sufficiently numerous to prove that bees visit large and highly coloured though

unmeliferous flowers for the sake of their pollen. *J. F.*

—In reference to what "W. H. R." states respecting colour having no influence on bees collecting honey, some few years back in the spring, when crocuses were in bloom, I was watching some of the insects; the Crocuses were of about equal proportion—blue, white, and yellow—and I found the bee that commenced with the white; *Crocus* kept to the white till he had obtained his load, and then left; and so on with the other colours, each keeping to one colour. *Dromo*.

Plants in Flower at Swancliffe Hall.—It was my privilege a few days ago to visit Swancliffe Hall, Ripley, Yorkshire, the seat of Captain Greenwood, and there I met with one of the best flowered plants of *Lupulina rosea* that I have seen for a long time. The plant is planted in a narrow pit under the staging in a span-roofed greenhouse running north and south, and is trained close under the roof, of which it covers a good portion on one side of the house, and is literally one mass of bloom. I counted 750 fully expanded blooms, with scores of buds to follow on; one shoot had sixteen fine blooms open and ten buds to follow, and numbers of others with from twelve to eighteen blooms, all of grand size and substance. On the opposite side of the house is a fine healthy young plant—three years planted—of *L. alba*, which has flowered quite as profusely as the var. *rosea*, but which had been shorn of most of its finest blooms for the sad purpose of making wreaths and crosses for the funeral, the previous week, of Mr. Greenwood. There are many other good things equally well done in this fine garden, including a grand plant of *Syringa floribunda*, which covers from one end to the other all the front portion of the roof of a lean-to stove about 30 feet long, and which, I was told, is rarely to be seen out of bloom. There is also a fine healthy stock of *Eucharis*, with no sign whatever of the dread disease. A nice batch of *Poinsettias* looked very promising, and another of *Gardenia florida*, with growths like young Willows, and a nice healthy young stock of *Crotons*, *Dracenas*, &c., for decorative purposes. Two or three cold pits are filled with *Violets*, for winter blooming, of *Marie Louise* and *Neapolitan*—the first-named was already pushing up quantities of strong buds. All the beds and borders, both in the pleasure-grounds and kitchen garden, are filled with a great variety of herbaceous plants and hardy annuals, which furnish immense quantities of cut flowers over the greater part of the year. The general keeping of the whole place reflects the highest credit on Mr. William Stanton, the courteous head gardener. *B. Ashton, Glassop Hall Gardens, Derbyshire*.

Gardenias for Flowering during the Winter and Early Spring.—We have found it a good plan, in order to secure these results, to keep the plants cool during the summer months; and some are, in fact, now (October 12) standing in a beach house where the lights (both back and front) are open all night. We purpose, however, to transfer them to a warmer house or pit in a few days, and then hope to see some of the forwardest buds soon push up. The main crop of flowers will, however, turn in early in the new year sooner than is the case with plants that are kept continually in a warm atmosphere. It takes an increased temperature to induce such plants to flower readily early in the season from two reasons; firstly, through the earliest buds having pushed up during the latter part of the summer and autumn, and secondly, by their not responding to slight forcing as those plants do that have been kept cool. Gardenias that are treated to a lower temperature may not look so healthy and thriving, especially at this season, but they will soon assume their wonted vigor and healthful appearance when placed in a genial atmosphere. Where it is desirable to increase stock with rapidly we would advise growers to take off large bushy growths for the purpose of raising them. Such plants are usually seen in 4-inch pots: this will be found to be easily accomplished with the aid of a propagating pit and a good command of bottom-heat. They will, in fact, strike almost as readily as Willows, and if wanted to progress rapidly it is only necessary to turn them out into the open soil in a pit with good command of heat, when, after a few months' treatment, they will give abundant bloom. Such a method is to be treated in the usual method, where it is needed, by giving an abundant supply of air or by the removal of the lights during the summer months. *J. Hudson*.

Beautiful Annuals.—Among the best annuals of the gardens in this neighbourhood are the *Scabiosa* and *Salpiglossis*; they have both been exceedingly beautiful, and even now they put the vase-beds to shame for their freshness and beauty of bloom, and rich and comprises many intermediate shades of light pink, lilac, red, and bright rosy-crimson. It is far more effective and manageable as a bouquet flower than the *Aster*, and requires less trouble and care in raising. *Salpiglossis* is less hardy and the foliage

more scanty and uninteresting, but its flowers more than compensate for the defect. It is one of the most elegant of annuals and probably contains the greatest variety of colours. Of what other flower could be said that there are all the colours of the rainbow—white, pink, rose, lavender, the deepest crimson, yellow, orange, blue and purple? Then it is charming for vases when placed loosely and with plenty of room. *Linum grandiflorum* is a beautiful annual, and the colour—a brilliant magenta—is unique; but it has long been seedling, and so has the dwarf *Convulvulus* and the blue *Corn-flower*, *Cyanus*. The most brilliant dwarf annual for bedding, I think, is the *Portulaca*, by the way, the *Antirrhinum*, sown in March, produces a fine display of bloom throughout the autumn. *T. W., Harrow*.

Pruning Evergreens.—I notice on p. 492 that we are told, "Laurel banks may be trimmed in as much as desired," and well remember some Laurel beds in a cold and damp situation that were severely pruned a few years since in the autumn previous to a severe winter. They had grown much out of bounds by previous neglect, and had got patchy, and were accordingly beheld to be cut down about 18 inches of the growth to start into growth again the following spring. However, the frosts which followed (about 27°) killed them to the ground, while others close by that were not pruned, escaped almost unharmed. Of course it is easy to see the cause of this afterwards, but I take it as a substantial proof that it is best to defer all severe pruning of tender evergreens until all danger of sharp frost is over. If the situation is a warm one, or if a good supply of foliage is to be left on the trees, there is not so much danger of unpleasing results. *W. H. Divers, Ketton Hall*. [We think by "trimmed in" our correspondent did not intend heading back, which should always be deferred to the spring, or even summer time, as the healing process is rapid then, and wood does not die back. Ed.]

Tobacco.—I have been much amused at the letters and statements published on the matter of the growth of Tobacco; from these letters and statements one is led to believe that something very wonderful has been achieved in growing in England a plant which is believed to require a hot climate. That somebody deserves a statue for opening up a new source of industry and manufacture. This happy and wonderful discovery, which is to drive away all agricultural depression, and to be a flaming beacon to the starving farmer, who has only to purchase a packet of seed which he can carry in his waistcoat pocket, sow next spring, cure the leaves produced, and secure a fortune, deserves all praise and encouragement—all success, and exemption from any and all interference from the excise-man; but it is to be feared that the government by loss of duty on foreign Tobacco, when the home article has defied the market! To make up the anticipated deficit I hope they will not increase the Income-tax. Well now, how has this Tobacco craze been set afloat, and what is there in it? Young men may be excused on the score of youth, old men on the score of failing memory; but surely there must be many, many men now alive who grew Tobacco—can it well be cured Tobacco, and cured in so well as used Tobacco, and used it to good purpose, some fifty years ago. I grew *Nicotiana virginica* and another kind, and saw some few experiments succeeded in making a very decent cigar—certainly a much better article than the ordinary penny Cuba cheroot. My case was by no means a solitary instance, for I know at that time it was a usual crop, and to be seen in many gentlemen's gardens, ordinarily on the front of a Vine border, or for some such place, and the gardeners used to grow for the gardener's use in fumigating, &c. Truly there is nothing new under the sun, but I have a notion there might be something new even in Tobacco culture in England if we could increase the power of that sun; but can we? There's the rub! If not, how can we hope to emulate those climes which now supply us with Tobacco, Maize, &c.? If scientists had discovered a means to increase indefinitely our sun-power [the electric light], then let us at once erect the statue that fifty years ago it was grown in many places in England; our lack of memory indeed will be quite excusable, for fifty years ago there was no *Gardeners' Chronicle* to tell us what was going on, so that it is perhaps not wonderful that success or failure in the culture of the fragrant weed received scant notice; nay, it is perhaps not wonderful that the experiments of 1836 are only repetitions of those of 1835; for, as far as I can discover, no new thing has been made known and the knowledge gained in the former year seems to have been lost or forgotten in the latter one. But there is a darker side even to the triumphant picture of a Tobacco-covered England. True, with very little attention the Tobacco seed developed into a majestic-looking plant, and produced magnificent leaves, but then came the time of tribulation. In my

own case, I was driven nearly distracted when people asked "What will he do with it?" And sorely pressed was I to answer the question. The leaves approaching maturity and assuming a delicate greenish colour, indicated that the harvest was nigh, but then came the difficult question to decide, "Is it nigh?" Whether at the very doors, or only within a measurable distance? To gather, however, was the least difficulty—but to dry? If allowed to dry too much they became brittle, if too little they grew mouldy, and the least speck of mould spoiled the whole mass. Then the ribs. What snags and delusions they were; how often my wish for happiness was wrecked by those dreadful ribs. Still, given a rich soil, a good warm summer, and still, but not least, a dry late autumn, very good Tobacco was grown fifty years ago; and now, given a cold wet summer, a dripping autumn, and early frosts, I would ask, in the language of the old farmer, who, when noting the difference between a coach accident and a railway smash, said, in the former it was, "Well, here we are," but in the latter, "Where are we?" And, "Where are we?" would I would permit me to ask of the enthusiasts in Tobacco culture after the cold, wet season described above? *Charles Noble.*

Double Tuberos-rooted Begonias.—Tuberos-rooted Begonias have come to the front during the past few years, and have been rapidly improved upon; perhaps no one has been more successful in raising good varieties than Mr. Geeson, the gardener at Haldon House, and many of which are to be found in most private collections. He has paid most attention to the double varieties, and the consequence of his labours being a diversified and splendid lot, among which may be specially mentioned—White Lady, a very beautiful large and free-flowering variety, which makes a good specimen plant, the best of the double whites yet cultivated. Perfection, a bold crimson flower, of good substance and shape, a strong grower, would form a good parent, together with some good upright flowering variety. Sulphur Queen, a very beautiful light yellow, fine bud when opening, good grower. Exonia, a distinct variety, deep pink, but not a true petal flower, very full and free-flowering. Snowball, pure white, medium size flower, very double, a most pleasing variety. Canary, creamy-yellow, distinct from Laing's Canary. John Parr, a seedling of 1856, deep red, of great substance, and bulky flower. Lord Haldon, his best seedling of the year, deep scarlet, very full and deep, like a series of double flowers packed regularly together; a grand flower. Juarez, a novelty, the colour of the Cactus Dahlia of that name, and a petal particularly fine, of the same; it will be a great acquisition if it remains constant. Carnation, also a novel flower, perhaps not an appropriate name, it being a fine pink with white centre and with imbricated petals. Beauty, a very compact pink, the petals overlapping each other so beautifully, very distinct. He has other named varieties well worthy of remark, but the above are the best, selected from some thousand seedlings. Singles have not made much headway under his manipulation, but the single is doing him some service, as he has produced some few promising upright forms of doubles, which under his skill may develop into some of very good upright form, which, though showing themselves naturally, and being of a stiffer habit and useful for cut flowers, cannot fail to become the Begonia of the future. Just a few remarks relative to the mode of culture may interest your readers. Double pollen has been very scarce this year, so that next year will not produce much, perhaps, that is new, though the seed from one pot may produce a great variety. The seed is sown in boxes in light sandy soil in February, in gentle heat, and covered with glass; and as soon as fit to handle the seedlings are pricked off in boxes and pails thickly, and as they increase in size they are again pricked off in boxes, so that by the end of May they are fit to be transferred to the open ground in a warm situation, where they seem to thrive better than if grown in pots, and in both instances being given plenty of potting soil with plenty of leaf-mould and sand. Treated so they seem to grow and thrive well, presenting during the summer and autumn months a gorgeous display of bloom. *Visitor.*

Tuberos Begonias at Messrs. Laing's, Forest Hill.—Accompanied by some gardening friends during a recent peregrination in and around your metropolis, I visited Staines Park and nurseries to see Messrs. Laing's tuberos begonias bedded out and growing in the open air as contradistinguished from the customary system of growing and blooming them in glass cases. Although this was the primary object of our visit, we saw and learned many other things. Though tuberos Begonias have for about half-a-dozen years been largely and successfully grown bedded out, in several gardens around here, and many other parts of Ireland, indeed, I am not sure if our moist climate and more equable temperature does not give us an advantage over England, yet no previous conception would enable a stranger to realise the enormous

numbers, the great range of colours, or the great size and substance of the blooms to be seen in the open air. It must be remembered, I am now speaking of seedlings raised from the firm's own home-saved seed—such as they supply to their customers—raised in heat in seed pans in January. At the first the grow is slow, but when established great progress is rapidly made, and the young seedlings are fit to plant out in June. They can now raise seedlings true to name and colour and of uniform size for bedding purposes. The colours are so varied and the foliage in most cases so handsome that it is no stretch of the imagination to suppose that these bedding plants would rival the best raised at Hampton Court. There were distinct panels of colour in the beds at Staines Park far more brilliant and gorgeous than anything observed at Hampton Court or in any of the parks. For those commencing Begonia culture for bedding purposes, it will be safer and more satisfactory to begin with dry bulbs, which can be obtained wondrously cheap during any of the four months of winter, and of course true to name and colour. Beds or patches of the same variety are always most effective. For this purpose Messrs. Laing cannot recommend any forcing by fire-heat—"Let them start naturally in spring" is the motto. They continue to bloom into November—probably some of the beds we saw are still brilliant—mine are still outside and unaffected by rain or storm. Thin papery flowers, weak growers with reclining blooms, or those with narrow weak petals, are all ruthlessly rejected among the seedlings; bright round flowers, of great substance, and very floriferous, are the standards, and by the thousands these are gradually obtained here. Indoors we saw several houses of the named famous doubles, so often observed at the metropolitan shows, but I must not intrude further on your space than to ask permission to thank Mr. Laing, Junr., for the courtesy we received. *W. J. Murphy, Clonmel.*

Colour of Primroses.—Can any of your correspondents give the facts as to the influence of the constituents of the soil on the colour of Primroses in this country, where old varieties are not lost sight of. The plant is easily grown, and may be planted out in May, and taken up in October and placed under the greenhouse stage till the following spring. I came across a plant so treated the other day on the highest hill in this county—viz., Crowborough, 800 feet above sea-level, and this treatment answered perfectly, and the trusses of blossom were magnificent. Another old kind of Fuchsia (*fulgens*) is still growing by the cottages. This is really a tuberos-rooted kind, and very easily managed. I have very often wondered why these two have not been more used by raisers of new kinds; they are so very distinct in habit. *F. microphylla* I also found in a cottage window; this is the smallest of all the Fuchsias, and very neat in growth. The old *globosa* I grow in vases at my office-door; and many are the cuttings begged for "Auld Ling Syne." *J. Rust, Erleigh Castle, Sussex.*

Fuchsia corymbiflora.—I have known this plant for a great many years, and meet it occasionally in this country, where old varieties are not lost sight of. The plant is easily grown, and may be planted out in May, and taken up in October and placed under the greenhouse stage till the following spring. I came across a plant so treated the other day on the highest hill in this county—viz., Crowborough, 800 feet above sea-level, and this treatment answered perfectly, and the trusses of blossom were magnificent. Another old kind of Fuchsia (*fulgens*) is still growing by the cottages. This is really a tuberos-rooted kind, and very easily managed. I have very often wondered why these two have not been more used by raisers of new kinds; they are so very distinct in habit. *F. microphylla* I also found in a cottage window; this is the smallest of all the Fuchsias, and very neat in growth. The old *globosa* I grow in vases at my office-door; and many are the cuttings begged for "Auld Ling Syne." *J. Rust, Erleigh Castle, Sussex.*

Solanum capsicastrum.—Our stock of this most useful and ornamental berry-bearing plant never looked better for the season of the year than they do at the present time. They are loaded with berries, only the forward of which are changing colour, as they are not "wanted" before the *Chrysanthemum* are over; there is yet plenty of time for them to finish up and make handsome subjects for the conservatory for the Christmas season. They are still growing in the open ground, but we hope to have them potted up by the time; this is in print. After this operation is finished, they will be stood in a cold frame raised sufficiently high to take them comfortably, the tallest standards being some 2 feet 6 inches in height. Attention with regard to shading during bright sunshine and exclusion of cold or sharp currents of air will be necessary, but a close humid atmosphere must not prevail, although frequent syringing for a time will be requisite to induce fresh root action. During dry weather and at night air will be given freely, the lights even left off when most favourable to the same. We never fear any material check in lifting, although they have not been cut round with a spade at any previous time; our practice being to shake off all the old soil when the plants are turned out in June, and the roots trimmed in when needful at that time. When lifted therefore the balls are found to be one mass of fibrous roots to the centre of the plants, with of course no trace whatever of having been turned out of their pots some months previous. After the plants have served their

course in the conservatory in the spring (during March generally), we remove them to the large vases, then on the move, keeping them dry for a week or two; they are then divested of their berries and pruned back the same as with *Fuchsias*. Having fairly broken into new growth they are gradually hardened off prior to being again planted out in their summer quarters. During August or early in September, when a good set of berries is secured, the plants are gone over and all shoots stopped back close to the berries; this concentrates the sap at the base, the development of the latter besides inducing them into a more prominent notice as well as contributing to their well-being by more exposure to the light. Attention is needed at times during very dry weather in the way of watering, and a good soaking should be given before the plants are lifted; the green-ivy may at times be troublesome, but a little tobacco-powder will soon set this matter right. We have adopted this method with but slight variation for several seasons, and have never found the system to fail us. *J. Hulson.*

Daffodil Seed and Cross-Fertilisation.—A writer in one of your contemporaries says Daffodil raising is not likely to remain much longer a kind of lost or occult art; we may look forward to being able to purchase the seedsmen for a modest cwt in a packet of Daffodil seed, as we can now *Amaryllis* seed, "carefully hybridised," and likely to produce many new and beautiful varieties. As to "cross-fertilisation" and its effect, I do not think I need wait for five or six years to ascertain results. My friends in the Colonies, America, and Cuba, will be very glad to get "mixed packets"; and the seed offered by me, I believe, for the first time in England, has up to this been all sold as such, and instructions given that it may be so. It is probable that what I have been trying to effect with the brush, aided by the bees, from early in February in our mild climate, to the end of April, will be lost to science; meantime, I have myself separately sown each cross in large quantity, and shall be only too glad to give results at a future time. What am I to do with all the seed that can be saved on my grounds for six years?—My first year's crop having resulted in a cross of 14 oz, all sorts which I considered it would be waste to pitch into the rubbish-heap. As regards what others may have done we have very little knowledge, but we are led to believe by what the late Mr. Nelson wrote a few days prior to his death, that cross-fertilisation was not resorted to. Mr. S. A. De Graaff, of London, has a variety of seedlings in store for use, all hand-fertilised or chance hybridised, and the late Mr. Beckhouse wrote in the *Gardener's Chronicle*, June 10, 1857, that results were the same under artificial crosses and chance fertilisation. As to effects resulting between seed saved from a cross between a *Corbularia* and major variety, I have, some four years since, given bulbs of the common *Corbularia* to a friend to try his "prentice hand" between it and the Tenby *Fulgidum*. He has raised some 320 seeds, the bulk of which flowered this spring, exhibiting the *Corbularia* in a "giant form," and now at present many are appearing above-ground in a cold greenhouse with the foliage of the Tenby. He has sent me test bulbs, which are to be known as "Smythe," *W. B. Hartland, Cork.* [We have omitted some portions of our correspondent's letter, as they concern our contemporary rather than ourselves, or our readers. Ed.]

Strawberries Ripe Out-of-doors.—On the occasion of a visit to Sansbury Green, Haits, on the 15th of the S. railway, I saw a Chill in the garden which is in spring rather than in October; and on looking over a large bed of Sir Joseph Paxton I saw upon about a hundred fruits, most of which were colouring, and some were quite ripe. These plants were growing in the garden of Mr. J. King, Myrtle Cottage, who has about one thousand pots of Sir J. Paxton, as fine plants as I have seen this season. *W. D.*

The Ivy in Guernsey.—The common Ivy here seems to be a distinct variety. Whilst roaming lately with several friends through the delightful lanes of this lovely island—so rich in greenery of all sorts—our attention was repeatedly arrested by the singularly neat growth and beautiful green colour of the Ivy growing in great luxuriance everywhere. It was not the Irish Ivy—that was evident, the leaves being much smaller and altogether a neater and prettier plant. It was at either like the common English Ivy, being of a sturdier growth and the leaves of a uniform bright emerald-green colour. Could it be the climate that was rendering it so distinct and beautiful? It might be so, but no!—for here at our very feet was the common English Ivy, with its prominent veins and the peculiar purplish shade so characteristic of this variety. Here also was the Irish Ivy—all three being quite distinct. The compact growth and beautiful emerald-green of the Guernsey variety being most conspicuous. How has it escaped our notice so long? Perhaps not. Could the word "emerald" suggests our comparison of it with

Ilbberd's emerald-green—one of the best Ivies grown—and we are forced to the conclusion that they are very similar if not identical. If so, would it not be better to call it at once the Guinevere Ivy (Hedera Helix var. sarriensis)? A. F. B.

Arenaria norvegica in Scotland.—I think it may interest you to know that I picked up a specimen of Arenaria norvegica on the bank of the river Lyman, at Inchmadamp, near the head of Loch Assynt, on August 7. When I saw the plant (which I identified as above the day following) it struck me as being something I had never gathered before. I went back to near the spot where I had seen it a few days later, but could not find more just then, but on the way home I came upon a good patch of about seventy or eighty plants, covering, I should say, about to square yards or thereabouts, perhaps more of the river bank (a light sandy alluvium). This was at a distance of a few hundred yards from where I found it. I sent a specimen a short time ago to Dr. Stirton, of Glasgow, and I understand he was much pleased at the discovery. I have been collecting lichens for him, and shall forward them to him for description. A. Gray, Tongue, Sutherland. (We should be greatly obliged if our correspondent would kindly send a specimen to us. Ed.)

Grafted Grapes.—I have often heard it said that black Grapes should not be grafted on white ones, because they would not then colour well. According to my experience this is not the case, it is quite different to that of "F. L." in your last issue. We have growing here three kinds of black Grapes, all grafted on stocks of white kinds. Gros Colmar and Alnwick Seedling are one; Gros Colmar and Alnwick Seedling are on the *Vi*-stocks; they are growing in the late vinery, and at the present time are carrying a crop of perfectly coloured Grapes. The other is Barbarous, grafted on Muscat of Alexandria, and growing in the Muscat-house; it was inarched about two years ago, this year it is carrying two bunches, which are quite black. We have also Duke of Buccleuch inarched on Black Hamburg, which always gives us bunches good in size and colour, but some of the berries cast to the *Vi*-stocks; this, however, is not the fault of the stock, as the Duke does the same on its own roots. When the Alnwick Seedling was inarched two spurs were left on the stock below the union; on these we sometimes allow a bunch to remain, we have then white and black on the same roots, and both all that could be desired in colour, according to their respective kinds. I think that when a black Grape, grafted on the stock of a white one, will not colour well, the cause must be sought for elsewhere than in the stock—most probably it will be in the border in which it is growing. A. Baker, Huddip.

—In your last issue "F. L." says he has never been able to produce satisfactory black Grapes from a union with a white. I may state that at a fruit show held at Luton on September 20 Messrs. Lane & Sons, of Berkhamstead, showed a collection of Grapes and other fruits. Conspicuous amongst the Grapes shown were three bunches of Gros Colmar in marvellous Maroon or Alnwick Castle Seedling. I asked Messrs. Lane's manager in charge which stock they preferred for Colmar; he informed me, nothing but Foster's Seedling (white). I confess that for finish I never saw anything that could surpass them, and any one who wishes to grow the Colmar in proper form may safely follow in Messrs. Lane's footsteps. W. M. B.

Gynierium jubatum.—Some time since I met with a description of what purported to be a new and very interesting plant, *Gynierium jubatum*. I purchased it at once, but find it is now in flower, and proves a very inferior variety of *Gynierium argenteum*. Query: Is there such a plant as *G. jubatum*, and what is it like? Charles Noble.

Pears and Apples in the North.—I notice in your report of the fruit show at South Kensington that the Marie Louise Pears from Lambton Castle, Durham, took third honours; with a remark that they were fine fruit for that northern county. It would be interesting to know if the Pears were grown under glass or in the open air. Lambton Castle is something like 50 miles north of this place, our soil is especially good for Pears, but on account of the lateness of the season we have nothing approaching to ripeness or size to compete with the Southern growers.

I have on two occasions taken second honours for Marie Louise Pears at South Kensington, and once I took first for the heaviest Alnwick Apples, Mr. Siron of West Park, Surrey, taking second. The following year the champed places—he was first and I second. On those occasions the summers were summers; and we were able to compete with Southern growers of fruit on more equal terms. In the last seven or eight years I have had no fruit to equal those in size; the warm seasons have been so short and dull, it was almost impossible to grow fruit to its natural size; and, so far as we are concerned, this season has

been one of the worst. Although the month of May was so disastrous for the Apple and Pear in bloom, I found the greater part of blossoms very small and imperfect, almost entirely without the pistil, consequently no fruit could be expected; this must have been caused by the cold, dull weather of 1885. The month of May in this year was especially bad for fruit; we had rain on twenty-one days, in all 4½ inches, and, what was worse, we had frost more or less on twenty-eight nights, in consequence many of the immature-formed buds did not open in the spring, but have flowered all through the summer, to the horror of the superstitious, who fancied something terrible must happen in consequence. The farmers, too, are suffering in the North from the late season. The lateness in a great measure was caused from the bad weather in the months of April and May, so that the corn crops could not be got into the land for quite six weeks after their proper time. This and a bad autumn is most disastrous to the Northern farmer—many of them as yet have never housed a sheaf. Up to the time I now write (October 18) we have had 3½ inches of rain in this month. From the cause I have stated the farmers are behind with their crops—I am behind with the Pears. If our friend in Durham will give us a hint how he has grown these fine Pears in this bad season he will do myself and others a kindness, and also prove himself a grower of big Pears as well as a grower of big Grapes. William Cubberwell, North Yorkshire.

Pears.—In order to avoid confusion it is well to notice while this subject is being discussed that "Ketton Hall," as part of the signature on p. 592 is a mistake, it should be "Wierton, Maidstone," instead, which is very different in climate to this place. In addition to what I have already said on this subject, now that the season is almost over I would again testify to the good qualities of Sturdy as a late crop Pea; our latest sowing of this variety was made on June 18, together with Dr. Maclean, Yorkshire Hero, and Walker's Perpetual; Dr. Maclean was ready to gather on September 2; Sturdy, September 7; Yorkshire Hero, September 9; Walker's Perpetual, September 18. Yorkshire Hero and Dr. Maclean were soon over; the other two varieties are bearing now, and will continue for some time longer, if frost does not kill them. Walker's Perpetual has the heaviest crop at the present time, but for flavour and appearance, both before and after cooking, Sturdy is much the better of the two. I have this day (October 18) had a dish of it for dinner that was good enough for a king, or any one else. This variety was raised by Luton, and distributed by Messrs. Veitch. W. H. Divers, Ketton Hall, Stamford.

Veitch's New Pea, Prodigy.—I think this Pea should not be blamed for shedding its bloom as described by Mr. Divers. I am of opinion that any Pea, whatever name it may go by, would stand a poor chance "on a dry soil, and with a scorching sun, and no means of watering." I am very pleased with it, grown on good ground, with plenty of manure underneath it, and one or two good drainings of water; it has been very much raised. It certainly has a grand appearance when well grown, and, as Mr. Divers says, it cooks of a nice green colour, and is good at table. What more can be desired? G. Merritt, Kington Hoo, Herts.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, 20, 1886. FOR THE WEEK ENDING WEDNESDAY, OCTOBER 20, 1886.

- Oct. 14.—Fine and bright generally, but at times overcast and dull.
- 15.—Bad stormy day, readings of barometer decreasing all day, and at midnight was 28.67.
- 16.—The morning rough and stormy. At 11.30 A.M. the barometer reading was 28.44. A bad day throughout.
- 17.—Very dull and rough morning, the weather moderated towards the evening.
- 18.—Overcast all day, morning misty, showery in evening.
- 19.—Morning dull, afternoon bright. Lightning at night.
- 20.—Generally a dull damp day.

LONDON: Atmospheric Pressure.—During the week ending October 16th, the reading of the barometer at the level of the sea increased from 29.42 inches at the beginning of the week, to 29.98 inches by 1 P.M. on the 11th, decreased to 29.13 inches by 9 P.M. on the 12th, increased to 29.78 inches by the afternoon of the 14th, decreased to 28.62 inches by half-past 11 on the 16th, and was 28.81 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.43 inches, being 0.35 inch lower than last week, and 0.44 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 60°.5, on the 11th; the highest on the 13th was 54°. The mean of the seven high day temperatures was 58°.

The lowest in the week was 39° on the 14th; the lowest on the 12th, was 50°. The mean of the seven low night temperatures was 45°.2.

The greatest range of temperature in one day was 19° on the 14th, the smallest was 8°.5 on the 16th. The mean of the seven daily ranges was 12°.7.

The mean daily temperatures were, 51°.7 on the 10th, 52°.7 on the 11th, 55°.2 on the 12th, 49°.2 on the 13th, 48°.5 on the 14th, 51°.9 on the 15th, and 50°.2 on the 16th. These were all above their averages with the exception of the 13th and 14th, which were 1°.5 and 1°.9 below, by 0°.1, 1°.4, 4°.2, 1°.7, and 0°.2 respectively.

The mean temperature of the week was 51°.3, being 6°.8 lower than last week, and 0°.6 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 114° on the 10th. The mean of the seven high readings was 84°.9.

Rain.—Rain fell on six days to the amount of 0°.72-inch.

ENGLAND: Temperature.—During the week ending October 16th, the highest temperatures were 64°.6 at Cambridge, 63° at Truro, and 62° at Leeds; the highest at Newcastle was 56°, at Preston 58°, and at Wolverhampton 58°.4. The general mean was 60°.

The lowest temperatures were at Wolverhampton 51°.8, at Cambridge 38°, and at Blackheath 39°; the lowest at Truro was 47°, at Plymouth 46°.5, and at Liverpool 45°.6. The general mean was 41°.9.

The greatest ranges of temperature were at Cambridge 26°.6, at Wolverhampton 23°.6, and at Blackheath 21°.5; the least ranges were at Newcastle 12°, at Preston 13°, and at Liverpool 13°.2. The general mean was 18°.1.

The mean of the seven high day temperatures was highest at Cambridge 59°.6, at Truro 59°.1, and at Plymouth 58°.9; and lowest at Newcastle 54°.5, at Sheffield 55°.1, and at Bradford and Sunderland 55°.5. The general mean was 57°.

The mean of the seven low night temperatures was highest at Truro, 49°.4, at Plymouth 48°.6, and at Brighton 48°.4; and was lowest at Wolverhampton, 40°, and at Nottingham and Hull 43°.7. The general mean was 45°.9. The mean daily range was greatest at Wolverhampton 15°.8, at Cambridge, 14°.5, and at Hull 14.2; and least at Newcastle 8°.4, at Preston 8°.7, and at Liverpool 8°.8. The general mean was 11°.1.

The mean temperature was highest at Truro 53°.2, at Plymouth 52°.7, and at Brighton 51°.8; and was lowest at Wolverhampton 46.9, at Sheffield 48°.5, and at Sunderland 49°.2. The general mean was 50°.4.

Rain.—The largest falls were 3.19 inches at Truro, 3.10 inches at Bristol, and 2.13 inches at Brighton; the smallest falls were 0.72 inch at Blackheath, 0.95 inch at Wolverhampton, and 1.03 inch at Sunderland. The general mean fall was 1.57 inch.

SCOTLAND: Temperature.—During the week end-

THOMAS GREEN & SON, LIMITED,

Smithfield Iron Works, Leeds, and Surrey Works, Blackfriars Road, London, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN. call Special Attention to their

PATENT WROUGHT-IRON MUNICIPAL OR ANGULAR CHAMBERED AND TUBULAR HOT-WATER BOILERS,

And others with **SHELVES**, and Hollow or Ordinary Cast-iron **GRATE BARS**.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are Specially adapted for Heating Greenhouses, Cooservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE**, a **SILVER MEDAL**, at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

TESTIMONIAL.

Messrs. THOS. GREEN AND SON, LTD., NORTH ST., LEEDS.

Re HEATING APPARATUS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 20,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly,

THOS. HEWSON, Borough Engineer.

Borough Engineer's Office, Municipal Buildings, Leeds,
January 9, 1886.

OSMAN AND CO., BENJ. FIELD, HERBERT AND SPAWN, WATSON AND SCULL, and others.

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blights. 1 to 2 ounces to the gallon of soft water; 4 to 16 ounces a winter dressing for Vine and Orchard-house Trees; and in lather from the cake against American Blight. Has obtained many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

Oil Paint no Longer Necessary. HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of ungrateful imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory; or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
From ALFRED LOWER, Esq., The Ryders, Akeley Lodge.
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CATION—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated Catalogue on Fencing, Hurdles, Fills and Entrance Gates, &c., sent free on application to

HILL & SMITH,
Brierly Hill Ironworks, near Dudley;

BOULTON & PAUL, NORWICH. WARNER'S CELEBRATED HYDRAULIC RAMS.

With new and important improvements. For the Water Supply of Villages, Parks, Manseons, Gardens, Greenhouses, Stables, Fruit Fields, Farmyards, &c.

Gold Medal awarded at Calcutta Exhibition, 1884. Made in a variety of sizes to suit different lifts and falls of water. Give constant supply for many years with but little attention and outlay beyond the first cost.

Pieces upon application, from 4s. 4d.

COPY OF TESTIMONIALS.

"Honoured Sir,—In answer to your letter this morning about the Ram, it is working well, lifting over 12 pints per minute, the size of supply pipe being 2½ inches, the length 237 feet, the fall 12 feet inches, the delivery pipe being 1 inch to the fountain, the length of pipe 126½ feet, rise of pipe from ram to fountain 78 feet, ram lifting 12 pints per minute.

"I remain, your obedient servant,
JOS. MILLARD,
"Gardener to Sir Alexander Acland Hook."

"Douglas, June 12, 1879.
"Gentlemen—Please find cheque. I have much pleasure in saying that I was asking the gentleman the end of last week how the Ram was working for him. He said it was working well, and he would not be without it for £200.

"Yours truly,
"ISAAC MILBURN,
"Range Manufactory, Strand Street, Douglas."
"Messrs. Warner."

"Walloid Rugby, October 23, 1883.
"Sir,—The Ram you have just put up for me gives me great satisfaction. With the 13 gallons per minute supply it raises, about 600 gallons, in 12 hours, and it is so trouble to start working, I hope it will continue to work as well, for it is a great convenience.

"I remain, yours truly,
"Messrs. Warner & Sons."
"Oxford, January 15, 1886.
"Dear Sir,—You will not doubt be glad to hear that the Ram you came down to advise about for Shotover has been fixed, and so far answers the purpose admirably.

"Yours, &c.,
"J. S. BROWNING."
"Newton, Strickland-on-Tyne, August 24, 1885.
"Dear Sir,—The Ram you supplied to me last year is giving every satisfaction. Please send the duplicate valves for it, and oblige, yours, &c."
"JOSEPH SVMM."
"138, Widenarsli Street, Hereford, September 3, 1885.
"Dear Sir,—The Rams you supplied to me last year give every satisfaction. I have not heard of their stopping since they were fixed.—Yours faithfully,
ROBERT BAMFORD."

"Kilvedon, Essex, January 13, 1886.
"Gentlemen,—The Ram which I fixed at Little Braisted Mill or Jas. Faber, Esq., I am pleased to say, gives great satisfaction, and is unaffected by the flood, working as well when quite submerged by water and even lost to sight, its locality only indicated by the bubbles (in the pulse-valve) and notwithstanding the heavy flood we have had it has only stopped once. It throws or 145 or 220 gallons in a twenty-four hours.—Yours truly,
"JOSEPH POLLEY."

SMITH'S-COLCHESTER LIVE-LONG CANDY, THE BEST DIGESTIVE.

No household should be without this valuable and palatable Stomachic so highly spoken of by the Iron Duke (Wellington) and a small piece taken after a meal has an effectual PEPPER-APPLET against Indigestion.

Heaviness or Burning on the Chest and Fullness after Meals: or, taken at bedtime, by its warm-giving and Stomachic properties PROMOTES SLEEP. A small piece dissolved in the mouth when exposed to damp and cold, WARMS the CHEST, and prevents those injuries which arise from Chills. It is invaluable to all SPENTMEN, and is recommended by the Duchess of Bedford, the Marquis of Waterford, &c. Price, 1s. 1/2d., 2s. 9d., and 4s. 6d.; of all Chemists. Be careful to buy only SMITH'S-COLCHESTER LIVE-LONG CANDY, PREPARED BY

THE GREAT DUCHESS OF WELLINGTON RECOMMENDING SMITH'S-COLCHESTER LIVE-LONG CANDY AT HIS CLUB.

SMITH'S-COLCHESTER CHEMIST, COLCHESTER, as, in consequence of its popularity, and the commonness of the name (Smith) imitations are rife. Per post, 1s. 4d., 3s., and 5s.; or, sample, free.

Accidents of Daily Life Insured against by the RAILWAY PASSENGERS' ASSURANCE COMPANY (Established 1849), 64, Cornhill, London. Capital £1,000,000. Income £248,000. Compensation paid for 412,000 Accidents, £2,215,000. Chairman, HARVEY M. FARQUHAR, Esq.

Apply to the Clerks at the Railway Stations, the Local Agents, or West-end Office:—8, Grand Hotel Buildings, W.C.; or at the Head Office:—64, Cornhill, London, E.C.

Plant, Seed, and Bulb Trade.—Retail WANTED, an ASSISTANT, thoroughly proficient with knowledge of Fruit preferred. A. BRAY, Floral Hall, Richmond, Surrey.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittance by Postal Order is preferred. Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Address, and also a Reference to the Advertisement which they wish Reprinted.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentlemen with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners Under Gardeners, Balliffs, &c. W. M. CUTBUSH AND SON have at the present time on their List Men whose characters will bear strict investigation, and such as from their personal knowledge can recommend as abilities, &c. Ladies and Gentlemen requiring either of the above can be suited with reliable, first-class men by applying to Wm. Cutbush & Son, Highgate Nurseries, London, N.

Gardeners. THOMAS KENNEDY AND CO. have on their List a number of First-class GARDENERS, FORESTERS, &c., wishing engagement, and will be glad to furnish particulars to any one in want of same.—THOMAS KENNEDY AND CO., 108, High Street, Damians, N.E.

SCOTCH GARDENERS.—JOHN DOWDIE, Seaford, 114, Princes Street, Edinburgh, at present on the staff of the Scotch GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy competent Gardener.

To Noblemen and Gentlemen requiring Land Agents, STEWARD, BALLIFFS, or GARDENERS. JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter.—Enquiries should be made to No. 217, and 219, High Holborn, W.C.

To Gentlemen. MANAGER.—A GENTLEMAN intending to Invest Capital to Grow Choice Fruit, (Cut Flowers, &c., extensively for Market. Advertiser, thoroughly experienced, could secure large returns upon outlay.—INVESTMENT, 156, Lytton Road, Clapham, S.W.

GARDENER (HEAD).—Good Grower of Choice Fruit, Flowers, and Vegetables, also Early and Late forcing. Good character for ability, sobriety, and industry.—5, Colbrook Place, Twickenham.

GARDENER (HEAD).—Age 38, married, no family; thoroughly practiced in all branches. Good Manager of Men, &c., and accustomed to take entire Charge of a Garden Establishment. Highly recommended.—GEORGE MORRIS, Chapel Square, Kimbolton, St. Neots.

GARDENER (HEAD).—Scotch; has had thorough practical experience in all branches. An excellent Grape, Plant, and Vegetable Grower. Excellent testimonials and references.—J. G., The Cottage, Melbourne Nursery, Anerley Road, Anerley, S.E.

GARDENER (HEAD), where two or more are kept.—Age 26, single; thirteen years' practical experience in all branches. Can be highly recommended. Abstainer.—W. GOLDSMITH, The Gardens, Polesden, Dorking.

GARDENER (HEAD); age 34, married, no family.—Advertiser is open to engage with any Lady, Nobleman, or Gentleman requiring a thorough practical man in the management of a Garden.—WALTER SHAWLEY, 5, Griffiths's Terrace, Faulkner Street, Bishopshoftes, Chester.

GARDENER (HEAD); age 30, married.—J. SIMPSON, Gardener and Wood Agent to the Earl of Wharfedale, Wootley Hall, Sheffield, can with confidence recommend a man as above. Thoroughly experienced in all branches. Could undertake the Management of Woods, if necessary.

GARDENER (HEAD).—Thoroughly practical, sound, and experienced. Has an extensive knowledge of Gardening in all its branches, including the Forcing of Fruits and Flowers, the Management of Vines, and Flower and Kitchen Gardening. Twenty years in two last situations.—Q. NEAL, 255, Crookston Road, Sheffield.

GARDENER (HEAD WORKING).—Age 35; single; good practical experience in all branches of Gardening. Seven years' good character from present employer, E. Leach-Pemberton, Esq.—J. BUTT, Totty Hill, Sittingbourne, Kent.

GARDENER (HEAD WORKING).—Twenty-five years' experience in Orchards, Stove and Greenhouse Plants, Early and Late Forcing, Peaches, Vines, Cucumbers, Potatoes, Kitchen Gardens, Long and Short Spans. Good references.—JOSEPH BUCKNALL, Edington, Birmingham.

GARDENER.—Good all-round man in every branch. Has excellent testimonials.—G. E., May's, 129, Piccadilly, London, W.

GARDENER.—Situation wanted by a young man (age 21), total abstainer. Well up in Scientific and Hybridizing Work.—H. B., 85, High Street, St. John's Wood, London, N.W.

GARDENER.—The Advertiser wishes to recommend a good Gardener (married), who has lived with him three years, and who is thoroughly honest and steady.—W. E. GREEN, Belgrave House, Sandown.

GARDENER.—A GENTLEMAN wishes to recommend a young man as Gardener (Second), where several are kept; or Head, in a smaller establishment. Was Second Gardener at last place, and had sole control over Ten Houses, Vinery, &c. Thoroughly understands Wall Fruit, Cucumbers, &c., and Laying-out Gardens. Would go Single-handed if required. Excellent character; strong and healthy, with a head and total abstainer.—Apply by letter to G. W. J., 13, Fernbridge Gardens, Bayswater, London, W.

GARDENER (good plain SINGLE-HANDED).—Age 28, single at present; good character.—M. ROSE, 65, Carlton Street, Kennington, London, N.W.

GARDENER (SECOND).—Age 30, married; first-class all-round man, well used to Nobleman's family. Open to engage for same.—B. G., 43, Stadium Street, Lot's Road, Chelsea, S.W.

GARDENER (UNDER) in a Gentleman's Garden. In or Out of Houses.—Age 29, single; good references. Abstainer.—W. N., 6, Burr Road, Merton Road, Wandsworth, S.W.

GARDENER (UNDER).—A young German, who is free of military service, experienced in all branches of Gardening, especially in Propagation, and with some knowledge of English, seeks situation in a large English Garden, as Under Gardener.—ARTHUR KIRBY, Garsington, Chemnitz, Saxony.

FOREMAN, inside; age 26.—E. SMITH is open to an engagement as above. Eleven years' experience. Can be well recommended.—E. SMITH, Much Deane Church, Herts.

FOREMAN, age 25.—CHAS. RAFFILL, Gardener, Low Hill, Birkby, Wetherhampton, can confidently recommend James H. Boker, now leaving here, for situation as above.

FOREMAN, in a good private establishment, where Early and Late Forcing is carried out with spirit.—Age 25; well recommended for character and ability by last and present employers.—THOMAS HARVEY, 37, Philip Street, Bishopshoftes, Chester.

FOREMAN, in a good establishment, where Early and Late Forcing is carried out with spirit.—Age 25; can be well recommended for character and ability.—THOMAS HARVEY, Newton Nurseries, Eastgate Street, Chester.

FOREMAN, of good SECOND.—Age 24; first-class in every branch. Excellent references.—GARDNER, Rose Cottage, Horseshoe, 2nd Hill, Yorkshire.

FOREMAN, or SECOND.—Age 24; eight years experience in all branches. Excellent references from large establishments.—R. W., 38, Elgin Terrace, Maiden Vale, W.

FOREMAN, or first-class JOURNEYMAN.—Age 24; ten years' experience; in last situation over two years. Can be well recommended.—J. LIDDARD, 109, Lot's Road, King's Road, Chelsea, S.W.

To the Trade. FOREMAN.—PROPAGATOR and GROWER.—Thoroughly experienced in producing large quantities of Cut Flowers, and Pot Plants for London Market and the Trade. Good references.—W. *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

JOURNEYMAN (FIRST), in a good establishment.—Two years' recommendation from last employer; also two years' previous.—A. BUSH, Goldings Hill, Loughton, Essex.

JOURNEYMAN, in Gentleman's Garden.—Willing to learn, not particular to wages.—MR. FRASER, Tetbury Road, Malmsbury, can with confidence recommend Thos. Glead as above.

JOURNEYMAN, in a good establishment.—Age 20; six years' experience. Can be well recommended. Highly preferred.—J. RICHARDSON, Great Stanmore, Middlesex.

JOURNEYMAN, indoors, in a good establishment.—Age 22; highly recommended; also excellent character and testimonials from last and previous situations.—F. CONN, Newton Nurseries, Eastgate Street, Chester.

JOURNEYMAN, or SECOND in a good establishment.—Age 21; six years' experience.—B. T. WOOD, Bladen Castle, Burton-on-Trent.

IMPROVER, in the Houses, or inside and outside.—Respectable. Good references.—State wages, &c., to Mr. MIDDLETON, The Gardens, Exbury, Southampton.

IMPROVER, in the Houses; age 17.—ALFRED SMITH, The Gardens, Wollstone House, Stourbridge, wishes to recommend a strong intelligent youth. Two years' good character.

TOUNERSYRYMEN or MARKET GROWERS.—Wanted, a situation under Glass. Eight years' experience. Good references.—Age 23.—A. M., Mr. Phillips, Jepson Road, Upton, Forest Gate, Essex.

TO NURSERYMEN.—Well up in general Indoor Work, Putting, Tying, &c. Good knowledge of Ferns, Propagating, and Forcing. Good scholar. Three years' character.—Age 20.—F. W., Norton Road, Southborough, Tunbridge Wells, Kent.

TO GARDENERS, &c.—Wanted by a young man (age 18), a place in good Garden; under glass preferred. Good worker; brought up in nursery; good Plant-Growing.—A. B. D. Spring's Nurseries, St. Albans.

TO NURSERYMEN.—Advertiser (age 22) seeks engagement in a good Hardy Tree Nursery, where he could go through the routine of Grafting, &c., during coming spring. Has good knowledge of Herbaceous Plants; Eight years' first-class testimonials.—E. E., 5, Stanley Street, Hull, Yorks.

POTTER or WATERER, and willing to make home of useful in Market Gardens, Nursery, Young; good references.—Apply at Oak Villa, Lorne Road, Forest Gate, E.

TO FLORISTS, &c.—Required, the Management of the above; good Saleable n. Three years as Manager in present situation. First-class references.—W. H., *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, London, W.C.

ESTATE CARPENTER.—Wanted by a gentleman man a situation as Estate Carpenter; used to all kinds of Repairs and Plain Painting.—WILLIAM F. ROWSON, Birkbeck, Market Rosen, Luc Loshie.

HOLLOWAY'S OINTMENT AND PILLS. Health's Defences.—None save the strongest can with impunity pass through the system of a weak man, or a man from cold to muggy weather so prevalent during the autumn and early winter months. Influenza, bronchitis, cough, sore throat, or quinsy will attack those most who have their health; but they can readily arrest any such complaint by rubbing Holloway's Ointment twice a day upon the skin over the affected parts, and by assisting its corrective action with appropriate doses of his Pills. This well-known, safe, and easy mode of treatment efficiently protects the invalid both from present and future danger without weakening or even disturbing the system in the slightest degree.

HARTLAND'S COLLECTIONS OF DAFFODILS AND NARCISSUS.

TAZETTAS

Table listing various daffodil varieties under the 'TAZETTAS' section, including quantities and prices.

HARTLAND'S DAFFODILS.

Table listing various daffodil varieties under the 'HARTLAND'S DAFFODILS' section, including quantities and prices.

SPLENDID MIXED IRISH DAFFODILS, for growing on Grass, by banks of "Running Brooks," &c., 35/- per 1000, 5/- per 100. IRISH DOUBLE DAFFODILS, 17/6 per 1000.

HARTLAND'S ORIGINAL "LITTLE BOOKE OF DAFFODILS."

ONE HUNDRED AND FIFTY VARIETIES TO CHOOSE FROM. The most fashionable of all flowers for general Spring Decoration, and most easily grown. Should be largely grown in PUBLIC PARKS near manufacturing towns. No trouble; only let them alone.

From THE GARDEN, October 10, 1885. "This list of Daffodils and Narcissus generally, from its form and contents, deserves more than a passing notice. 'Original' in two senses of the word, from having been among the first of its kind given to the people, and from being framed on lines distinct and different from all previous catalogues, it shows that much care and thought have been bestowed by an enthusiast on a 'labour of love'...

From THE MANCHESTER CITY NEWS, August 15, 1885. "DAFFODILS.—A Little Book of Daffodils is the title of a pamphlet by Mr. W. B. Hartland, of Cork, a famous cultivator of the famous Narcissus. It is really a catalogue, but the classification, notes, and illustrations raise it above catalogues of this kind, and will make it acceptable to all who wish to cultivate these 'spring delicacies'...

From THE GARDENERS' CHRONICLE, October 31, 1885. "Ye Original Little Booke of Daffodils.—A pretty illustrated Catalogue of the Daffodils, by Wm. Taylor Hartland, of Temple Hill, Cork, has reached us. The numerous illustrations seem very carelessly done, one of the best being a plate of the white Ceranus varieties from p. 17, graphs, and exhibited on a black ground. The text is historical and conversational, and authorities are freely quoted, so that it is something more ambitious than a trade list."

UNSOLICITED TESTIMONIALS.

From FRANK MILNE, Esq., Shilohampton, Bristol. "Your 'Little Booke' is delightful, and written by a real lover and observer of these grand flowers."

From C. DUNNAGE, Esq., Coll. Geol. Garden, Guernsey. "I am much pleased with your 'Little Booke of Daffodils.'"

From REV. G. E. ENGINEHART, Appleham, Andover. "Since writing to you I have received your 'Little Book of Daffodils,' for which I am much obliged. It is very nicely got up and most interesting."

From MISS JERVELL, Mundeast, Godingham. "I have to thank you for the copy of your most interesting 'Booke of Daffodils.'"

From F. W. BURRIDGE, Esq., Dublin. "Your 'Little Booke' is well done. Printing and descriptions exquisite. Makes one long for more illustrations."

From W. J. WOLFORD, Esq., Beechbrook, Co. Armagh. "Let me observe that your 'Little Booke' is most tastefully got up, and a credit to all concerned in its production."

From VERONICA'S NOTES, "The Garden". "Mr. Hartland has done good service in hastening up the 'Swan's Neck' and other rare old Daffodils, which have lingered in that 'Eden of the West,' 'Faire Irelande,' as Chaucer has it."

From MRS. MURPHY, Turvey Rectory, Bedford. "I am delighted with your 'Little Booke of Daffodils.'"

A LADY writes:—"Your book about Narcissus is very interesting, but is it not too imaginative and Eastern? Surely you must have been dreaming of the prophet Mahomet, who said that if a starving man had two cakes of bread he should sell one of them and buy some flowers of the Narcissus; for that bread was only food for the body, but Narcissus was the 'food of the soul.'"

From WILLIAM W. MURPHY, Esq., Johnson Street, Chertkham, Manchester. "Though but a beginner, I may say, I have been very pleased with your 'Little Booke of Daffodils.' It certainly merits the title of original, and the information is much more complete than in any other catalogue."

Extract from THE QUEEN, August 22, 1885. "The original 'Little Booke of Daffodils' is very well arranged and illustrated, issued by Mr. W. B. Hartland, of Patrick Street, Cork. Lists of Daffodils would do well to procure this elegantly got up book."

From C. J. GRAHAM, Esq., Combe Road, Croydon. "Your 'Little Booke' is a gem. Send me half a dozen for my friends in Croydon."

From THOMAS ROGERS, Esq., Hon. Sec. Manchester Botanical Association. "Sir,—I have to thank you most cordially on the part of the Manchester Botanical Association for the handsome contribution of Daffodil flowers which you sent for a special occasion on April 12. The President of the Association, Mr. James Percival, said that he had no hesitation in declaring the collection was the finest ever seen in Manchester."

From T. H. BRYANT, Esq., Juniper Hill, near Dorking. "I must write and say how well the selected bulbs of Daffodils turned out. I am sure you will be glad to hear of it, as you personally superintended the order."

"I may mention that 'Daffodils' from roots supplied by you are now very here; 'Princes' has been superb."

From M. TOWNSEND, Esq., Avenue Villa, Millbrook Road, Freemantle, Southampton. "I beg to thank you for the 'Booke of Daffodils,' which is excellently done, and most interesting."

This Book is "One Shilling" Post-free, but Gratis to all Purchasers. ** Please see "Satirical Criticism" on the above Little Booke in THE GARDEN for October 2, 1886, over the initials of "G. H. E." and to which I have been denied the right of reply, unless such reply were to emanate as a re-hash, and a meaning put upon words that I never used. I am in possession of the re-hash, which I intend to publish at a future period, so that the readers of the GARDENERS' CHRONICLE can see the two pictures.

WM. BAYLOR HARTLAND, OLD ESTABLISHED GARDEN SEED WAREHOUSE, CORK.

ROOTS for SPRING FLOWERS.

WALLFLOWERS, MYOSOTIS, SILENE COMPACTA, SWEET WILLIAMS, POLYANTHUS, PRIMROSES, single, very healthy and all shades of colour, strong, planted, 1s. per dozen; 5s. per doz. DAISIES, red, white, pink, 1s. per dozen; 4s. per doz.; 25s. per 1000. VIOLETS and bedding FANSIES. *Alpine AURICULAS, AUBRIETIAS, CRABIS, 1s. 6d. per dozen; 8s. per 100.*

250,000 of the finest Hardy Perennials, all be named varieties. CARNATIONS and PICOTEES, 6s. per dozen. FANSIES, show variety, 3s. per dozen. POTENTILLAS, 5s. per dozen. HEPATICAS, red and blue, 3s. 6d. per dozen. PHEASANTS, year, 3s.; 2 years, 5s. per dozen. PERRYFRUMS, 4s. per dozen; 2s. per doz. PRIMROSES, double white, lilac and sulphur, 3s. 6d. per dozen.

FRILLSIAE BOLDI, 4s. per dozen. Mixed German IRIS, 2s. 6d. per dozen. Mixed English IRIS, 2s. per dozen; 5s. per 100. HOLLWOCK Seedlings, splendid strain, 4s. per dozen; 100 per 1000. DELPHINIUM Seedlings, all shades, 3s. per dozen. HARDY PEAS, all varieties, for continuous sowing, 12 kinds, 3s.; 25 kinds, 6s.; 50 kinds, 12s. 6d.; 100 varieties, 30s.; 100 plants in 50 varieties, 28s.; 200 varieties, 6s. 6d.

Stove and Greenhouse Plants
Very cheap, clean, and healthy; five houses from 100 to 120 feet long, full of the best plants. Very low price to make room for winter and spring stock, 12 varieties, 6s.; 25 varieties, 15s.; 50 varieties, 35s.

Six Acres of Fruit Trees.
Best croppers, well rooted, healthy trees.

APPLES, PEARS, PLUMS, and CHERRIES, Pyramids, 9s. and 12s. per dozen; Standards, 9s., 12s., and 18s. per dozen; dwarf-trained, 18s., 21s., and 24s. per dozen. CURRANTS and GOOSEBERRIES, 2s. 6d. to 4s. per dozen 1s. to 2s. per 100. RASPBERRIES, 1s. to 2s. per dozen; 6s. to 12s. per 100. STRAWBERRIES, 2s. 6d. to 4s. per dozen. VINES, for forcing, 25s. per 100.

Three Acres of Roses.
Well rooted, hardy plants (best sorts); 12 fine H.P. ROSES, 1s. 6d. for 7d.; 10s. for 7s. 6d.; 100 for 45s. MOSSES, CLIMBERS, ROSES, &c., 6s. per dozen. CATALOGUES free.

Forest Trees, Evergreen and Deciduous Shrubs, Conifers, &c.
Many thousands of these in all sizes and varieties, and in the most healthy and well rooted condition. See CATALOGUE. FOREST TREES of sorts, 6s. per dozen; 40s. per 100. EVERGREEN SHRUBS, 6s. to 9s. per dozen; 40s. and 60s. per 100.

DECIDUOUS, all beautiful blooming kinds, 4s. per dozen; 25s. per 100. RHODODENDRONS, fine named scarlet, pink, crimson, &c., shades, 18s. and 24s. per dozen. PRIVET OVALIFOLIUM, for hedges, 2s. per 100; 45s. per 1000. THORN QUICKS, 20s. and 25s. per 1000.

Everything wanted for a Garden in the best quality at low prices. Large buyers liberally treated. See Catalogue.

WM. CLIBRAN & SON,
OLDFIELD NURSERY, ALTRINCHAM;
12, MARKET STREET, MANCHESTER.

THE PLANTING SEASON.

THE BEST ROSES, THE BEST GAMBELLIAS, THE BEST HYACINTHS, TULIPS, &c. THE BEST EVERGREEN and DECIDUOUS SHRUBS, THE BEST PARK and ROADSIDE TREES, THE BEST FRUIT TREES and GRAPE VINES, THE BEST SEEDS, &c.

May be seen and purchased at
WM. PAUL & SONS',
PAUL'S NURSERIES,
WALTHAM CROSS,

(adjoining Waltham Cross Station, Great Eastern Railway, half an hour from London). Prices as low as possible. Inspection invited. Priced Catalogues free.

SEEDLING BRIERS.
Any quantity of 3, 4, and 1-year-old plants.

NEW ROSES of 1885-6.
15s. per dozen varieties (my selection); 30s. per 25 varieties (my selection). My FRENCH CATALOGUE of New Roses sent post-free. My complete ENGLISH CATALOGUE of over 1000 kinds of the very best Roses, with raiser's name and date of sending out of each variety, free for 7d. in stamps.

JAMES L. BOYSSON, Cuen, Calvador, France.

Clapton Nursery, London, E.; and Bush Hill Park Nursery, Enfield.

HUGH LOW & CO.
Invite inspection of the stock in these Nurseries—immense in extent, fine in quality, moderate in price—comprising AZALEAS, GAMBELLIAS, CYCLAMEN, CONIFERÆ, EPACRIS, ERICAS, FERNS, FRUIT TREES, GRAPE VINES, GREENHOUSES, and DECIDUOUS PLANTS. HARDY SHRUBS, ORCHIDS, PALMS, PELARGONIUMS, ROSES, STOVE and SOFT-WOODED PLANTS, TREE CARNATIONS, and CHARLIE NIEL ROSE, many thousands, in pots, grand plants, 15 to 12 feet in length, 18s. to 60s. per dozen.

274,600 Superficial Feet of Glass.

NOVELTIES FOR 1887.

NEW CULINARY PEAS.

The following three New Culinary Peas have been raised by Mr. HENRY ECKFORD, Gardener to Dr. Sankey, and will be found all of extra merit and great excellence:—

MAGNIFICENT (Eckford).

Awarded a First-class Certificate by the Royal Horticultural Society.

A grand main-crop Wrinkled Pea, of robust habit, growing about 5 feet in height, and producing, in the most profuse manner, large square-ended pods, containing six to eight fine Peas, of a light green colour and delicious flavour.

In sealed half-pint packets, 2s. 6d. each.

VICTOR (Eckford).

A dwarf second early Pea, of robust growth, attaining a height of 2½ feet, the pods being most prolifically produced in pairs, each pod containing an average of six to seven large Wrinkled Peas of exquisite flavour.

In sealed half-pint packets, 2s. 6d. each.

DIGNITY (Eckford).

A magnificent main-crop Pea, of robust growth, freely producing very long, square-ended pods, containing about eight large Wrinkled Peas of superior flavour. This is a grand Pea for Exhibition purposes, and cannot be too highly recommended. It attains a height of 4 to 5 feet.

In sealed half-pint packets, 2s. 6d. each.

Respecting the above Peas, Mr. CHARLES PENNY, Gardener to H.R.H. the Prince of Wales, writes:—

"Your new Peas are first-class in every particular, and I can confidently recommend them."

LAST SEASON'S NOVELTIES.

The following new Culinary Peas, by the same raiser, introduced last season, can be strongly recommended:—

DUKE OF CONNAUGHT (Eckford).

FIRST-CLASS CERTIFICATE.

A most excellent, distinct main crop Wrinkled Pea, attaining a height of 4 to 5 feet, producing, in the most abundant manner, long, square-ended, bright green pods, well filled with seven or eight large Peas of very superior flavour. It is a magnificent variety for Exhibition. As a proof of its great superiority, this Pea was, after trial at Chiswick, awarded a First-class Certificate by the Fruit and Vegetable Committee of the Royal Horticultural Society.

In sealed half-pint packets, 2s. 6d. each.

PROGRESS (Eckford).

A splendid late variety, growing to a height of 5 feet, very vigorous and productive, bearing a profusion of dark green pods of medium size, well filled with seven or eight bright green Peas of excellent flavour. This extremely prolific wrinkled variety can be strongly recommended as a marked advance on those already in cultivation, and is very handsome for Exhibition purposes.

In sealed half-pint packets, 1s. 6d. each.

536, KING'S ROAD, CHELSEA, LONDON, S.W.

Registered Address for Telegrams:—"WILLIAM BULL, LONDON."

NOVELTIES for 1887.
NEW SWEET PEAS.
Raised by MR. HENRY ECKFORD,
Gardener to DR. SANKEY.

MR. WILLIAM BULL has much pleasure in offering the following new varieties of this favourite annual. The sorts are all very distinct, and of unusual excellence, the flowers extremely pretty, and of the most charming and varied colours. They cannot fail to please, and can be highly recommended:—

- DUCHESS OF EDINBURGH**.—A very distinct and beautiful variety; the standard light scarlet, flushed with crimson, slightly marbled or splashed at the edge with creamy-white; wings deep rose. In sealed packets, 12. 6d. each.
- IMPERIAL BLUE**.—This effective variety is one of the most distinct and handsome; it has bright blue wings, slightly shaded with mauve, the standard being rich purplish-crimson. In sealed packets, 12. 6d. each.
- ISA ECKFORD**.—A most charming variety. the flowers being a beautiful creamy-white, heavily suffused with rosy-pink. In sealed packets, 12. 6d. each.
- ORANGE PRINCE**.—The most distinct variety ever sent out, and one that has been awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society. The standard is bright orange-pink, flushed with scarlet, wings bright rose varnished with pink; extremely handsome. In sealed packets, 12. 6d. each.
- THE QUEEN**.—A very beautiful and pleasing variety, the light rosy-pink standard being in charming contrast to the wings, which are light mauve. In sealed packets, 12. 6d. each.

The Collection of 5 Varieties, 5s.

NEW SWEET PEAS (Eckford).

- The following varieties were sent out last season, and can now be offered as follows:—
- CARDINAL**.—A splendid robust growing variety, producing a great profusion of bright, shining crimson scarlet flowers, very distinct and handsome. In sealed packets, 12. 6d. each.
- INDIGO KING**.—The standard of this charming variety is of a dark mono-purple, with clear indigo-blue wings. In sealed packets, 2s. each.
- PRINCESS OF WALES**.—A lovely variety, shaded and striped with mauve on a white ground in a most pleasing manner; flowers of great substance and perfect shape. It has been awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society. In sealed packets, 12. 6d. each.
- ECKFORD'S NEW MIXED SWEET PEAS**.—This special strain of mixed Sweet Peas is sown from choice named and unnamed varieties of Mr. Eckford's raising. These are of various colours, and the mixture includes many of great merit. In sealed packets, 12. 6d. each.

THE **Gardeners' Chronicle.**

SATURDAY, OCTOBER 30, 1886.

CORNISH MOORLANDS.

PASSING up through the quaint narrow streets of St. Ives, reminding one by its lichen-stained walls, grey tiles, and ancient seaworn look, of some towns in Brittany, we reach the once famous tin mine of St. Ives' Consols. Before us stretches a wide rough moorland, with a background of rugged hills. On the flanks of some of these, and climbing to their summits, like ghosts of a past prosperity, stand the deserted white engine-houses, silent and smokeless, the huge beams and fly-wheels rusting in the rains and sea-fogs. The moorland hills trend away in gloomy solitudes, partly shrouded in dense mists. Suddenly the clouds break, the sunshine pours through the rifts, and the landscape rejoices in its ample robes of emerald, purple, and gold. There is a mingling of the tones, softened by distance into rich browns, russets, and bronzy-greens. As we look more closely into the detail we see that there has been the usual fight for the survival of the fittest; at present, however, they only seem to jostle each other—the Bracken, Gorse, and Heather—in friendly rivalry; the dense dark cushions of Furze are stuck all over with the purple spikes of the Heather.

Pausing for a moment beside a moorland stream, we notice the Water Veronica and Myosotis palustris crowding the current with the Cresses. But what is the little stranger carpeting the bank, under the shade of the Ferns, with flowers like a small Convulvulus but of a Speedwell blue? It is the elegant Campanula hederacea; over and over again we find it creeping modestly round the skirts of the Heather, or peering up among the short sweet herbage in company with a tiny golden-yellow Potentilla. What a treasure if our garden at home! The streamlet, its Cresses and Forget-me-nots, the Ivy-leaved Bellflower, the arching Lady Fern, the mossy and lichen-stained wall, the tufts of wild Thyme, Heather, Bracken, and Gorse, the Foxglove, the Mullleins, the Brambles! We stroll for a mile or two by the margin of another moorland stream, here deepening into pools, there gliding beneath the Fern fronds, hastening on with sparkle and flash and pleasant soothing murmurs to its bourne in the broad Atlantic, scarcely two miles away. Seated on a fragrant cushion of wild Thyme, under a canopy of Bracken and Bramble, drooping with clusters of blue-black fruit, we watch a butterfly's ball. Bending across the stream is a tall clump of Hemp Agrimony. Its pale lilac corolla are the ball-room floor, the walls the granite hills, the ceiling the great blue sky. Waltzing over it and settling on it at the moment we write are five Purple Emperors, three Peacocks, a Tritillary, and a Brimstone, momentarily shifting the angle of their wings to catch the sun-rays more

and of the same colour. Petals narrower, with a very narrow base, also curved. All these parts have numerous transverse ochre-yellow bars. Lip distinctly unguiculate, trifid, having a notch with a conical acute spur in the middle, the mouth of which is covered by a retrorse callus, which projects in the form of two retuse shanks, while another callus stands at the base. Side-laciniae blunt, dolabriform, acute at the edge of the anterior margin, the apex being antrorse, and sometimes with one, at other times with two small supplementary teeth. Mid-lacinia cordate, oblongo-elliptical, with a rough lobulate border as in *Vanda Cathcarti*, but much narrower, and with seven to nine radiating keels, which are whitish, as is the greater part of the lip.

flower I got, 1864, from M. Linden, had a narrow caudicula and a narrow glandula. In February, 1872, I received fine flowers from Mr. Mendel with a broad caudicula and a broad transverse glandula. Several species of *Sarcanthus* have very broad caudiculas and glandulas, when other ones show those organs narrow.

As to the generic name I stick to that given by myself. I never took any steps to make it popular. Those amateurs who are of the usual conservative view may call it *Vanda Clarkei*—I only protest against making me the author of it. The canon laid down by Alphonse De Candolle would give the decision in many questions of nomenclature, viz. that one should never make an author say what

pression for a village of stoves and conservatories at Upper Clapton. There were very small inflorescences just peeping out. I was, therefore, most agreeably surprised to obtain a fine inflorescence from Mr. Day, who, having received the plant from Messrs. H. Low & Co., had once more the success of flowering first in Europe a very interesting Orchid. *H. G. Rehb. f.*

ONCIDIUM TIGRINUM (*Liave and Lexarza*),
VAR. LUGENS.

This variety has both sepals and petals of a uniform dark reddish-brown inside, the extreme tips being yellow. The dorsal keels on those organs are green. It was sent me by Mr. F. Sander, to whom it had been forwarded by Dr. Duke, The Glen, Lewisham. *H. G. Rehb. f.*

FIG. 109.—CEDAR AT BAYFORDBURY. (SEE P. 552.)

Border and area between the keels of the anterior laciniae light brown. Side-laciniae with brown transverse streaks. Calli white, with some brown. Column plump, ochre-coloured, with brown spots. Anthers ochre-coloured, mitre-shaped, with reddish apicules, caudicula narrow under pollinia, suddenly much dilated. Glandular body hipocrepic and concave.

That the plant is just the sister of *Vanda Cathcarti* no one will doubt. There is a certain language of flowers that you must listen to, and as soon as your definitions go another way you get to confusion. The difference in the shape of the sepals and petals might frighten a beginner. The lip corroborates the character I took for *Esmeralda*. There is one difficulty. This is the transverse caudicula and glandula. The matter is, however, not so very hard as it might appear to be. To begin with, *Vanda Cathcarti* herself has now and then different glandulas. The first fresh

he did not intend to say. What would Linnæus have felt in seeing *Cypripedium calceolus*, L., in lieu of *Cypripedium calceolus*, L.? What disgust I felt the other day when seeing in a new publication "*Uropeidium Lindeni*, Rehb. f.," whereas the plant is *Uropeidium Lindeni*, Lindl., and when I would never admit such rash changes of names.

The plant was discovered on October 17, 1875, by Mr. C. B. Clarke, the learned monographer of Indian Composites and of Commelynaceæ, the co-operator of Sir Joseph Hooker in the *Flora Indica*, of Messrs. De Candolle for Commelynaceæ and *Cyrtandra*, one of the few acknowledged "Indian botanists." Lately the plant arrived at Messrs. H. Low & Co.'s. Dried flowers had been kindly given me by my oldest English correspondent, Mr. Stuart Low. I was much pleased to see the other day a few living plants at that "immense expanse of glass," the English ex-

ORCHIDS AT MESSRS. JAS. VEITCH AND SONS.

In the great Cattleya-house, as indeed in all the other departments, the perfection of culture is to be found; the great masses of *Laelia purpurata* and *L. elegans* bearing flower-sheaths on nearly every leading growth, and the seemingly countless numbers of *Cattleya Trianae*, *C. Mossiae*, *C. Meodeli*, *C. gigas*, *C. Dowiana*, &c., are as thickly set with the promise of flowers to come as they can well be, while the plants themselves are in point of vigour all that the heart of their exacting grower, Mr. Caobam, could desire. Chief among the bright things in bloom in the Cattleya-house must be named Messrs. Veitch's last addition, *Cattleya Bowringiana*, which with its bright rose and dark crimson flowers seems to fill a void at this season, and onward throughout the winter; it is a distinct and eminently

desirable plant, and so floriferous that it frequently bears ten or a dozen flowers on a spike. Several plants of the true autumn-flowering *C. labiata* are also in bloom, and one of that still rarer and equally beautiful true old *C. labiata* Pescatorei, which is also a winter bloomer. The Mexican *Lælia*s are showing well for bloom, among them being fully expanded some fine plants of *L. autumnalis* atroburens, which is a very showy form, more floriferous and better in every respect than the ordinary variety. Also in bloom in the Cattleya-house are a fine lot of *Lælia Perrii* and some good examples of *L. elegans*, including the showy and fragrant *L. e. prasiata*, and even the small plants of *L. superbiens* are furnished with spikes. Some *Vandas*, different forms of *Cattleya intermedia*, *C. bicolor*, *C. maxima*, and *C. Dormanniana*, also take their part in the show of flowers.

CYPRIPEDIUMS.

The hybrid *Cypripediums* raised at Chelsea have always a goodly number of them in bloom. Of them the grand *C. Morganæ* (illustrated lately by us at vol. xvi., p. 243) may be said to be the queen, as it runs the famed *C. Stonei* plant 'genium very hard in point of beauty, even if it does not heat it. *C. Schroderæ* with its gigantic rose-pink flowers and extraordinary elongated petals, may be said to be the king of the *Sedeniform* section, which seems to be perpetual flowering. At present in this section *C. Sedeni* and the chaste *C. S. candidulum*, *C. calcareum* and *C. cardinale*, are in flower. Also in bloom, as head of another section, is the beautiful *C. cernanthum superbum*, whose dorsal sepal exhibits a rich combination of colour, white, black, and crimson being charmingly blended on its polished surface. Among the other rare hybrids, most of them the result of *Mr. Sedeni's* skill, in bloom are *C. stenophyllum*, of the *Sedeni* strain; *C. conchiferum*, a hybrid with *C. Pearcei*; *C. Arthurianum*, a lovely cross out of *C. Fairreanum*, with yellowish flowers spotted and veined with blackish crimson; *C. vexillarium*, another cross with the same rare species; *C. Ashburntonæ*, *C. Grossianum*, *C. marmorophyllum*, *C. seligerum majus*, *C. Lee-anum superbum*, a charming variety raised from *C. Spicerianum* and *C. insigne violaceo-punctatum*; and *C. macropterum*, between *C. Lowii* and *C. Veitchii*. Of the species of *Cypripedium* there is a fine show of *C. Spicerianum*, *C. Godefroyæ*, *C. concolor*, *C. Stonei*, *C. Haynaldianum*, *C. insigne sylhetense*, and the largest flowers of *C. Veitchii* we have yet seen.

DENDROBIUMS, PHALÆNOPSIS AND ODONTOGLOSSUMS.

In the warm and intermediate houses in bloom are several of the rare and floriferous *Dendrobium ciliatum*, *D. palpebre* with Primrose scented flowers, *D. rhodostoma*, Messrs. Veitch's perpetual flowering hybrid; *D. formosum giganteum*, *D. bigibbum*, *Sigmatostalix radicans*, the rare scarlet *Renanthera matutina*, some showy *Pliones*, a grand form of the beautiful *Vanda Sanderiana*, another of the blue *Vanda cœrulea*, some profusely flowered *Burlingtonia fragrans* (one with sixteen spikes); *Peristeria elata* and in the *Phalenopsis* house a good show of *Phalenopsis amabilis*, *P. violacea*, *P. rosea*, *P. Lowii*, and *Odontoglossum Roezlii*, while in a corner of it is a nice batch of *Anacochilus*, with their beautifully coloured leaves: these are not under glasses, but thrive well grown as the other plants in the house. In the large *Odontoglossum*-house and lean-to at its end, which are always gay with flowers, there is at present a fine display of *Odontoglossums*, of which the *O. crispum* and its varieties and *O. Pescatorei* are the favourites, and *O. grande* the showiest. *O. Sanderianum*, *O. madrense*, *O. hastilabium*, and the pretty old *O. Uro-Skinneri*, which has again become scarce, are also in bloom, and with them a fine lot of the violet-coloured and violet-scented *O. Edwardii*, sending up strong spikes; so also a fine batch of *Oncidium macranthum*.

ONCIDIUMS.

The genus *Oncidium* has in bloom many examples of *O. tigrinum* and *O. varicosum*, *O. leucociliatum*, *O. Forbesii*, *O. pratense*, *O. ornithorhynchum*, *O. Ionianum*, the pretty *O. Batemannianum*, *O. O'Brienianum*, *O. incurvum* and its rare white variety, *O. l. album*; *O. linguiforme*, with numerous flowers with light bronzy-yellow sepals and petals and rose lip; and several other rare species.

VARIOUS OTHER ORCHIDS.

Also in bloom in these houses are *Calanthe Domi-*

niana, *C. masuca*, *C. Mylami*, *C. Turneri*, *C. veratrifolia*, *C. oculata gigantea*, *Miltonia Moreliana*, *M. Clowesii*, and that finest of its varieties, *M. C. castanea*; several finely flowered *Houlletia Brocklehurstiana*, *Pilumna fragrans*, *Maxillaria venusta*, *M. grandiflora*, the wonderfully curious *Cynochloë Egertoniana viridis*, *Trichosma suavis*, some *Masdevallias*, *Epidendrum falcatum*, *E. Cooperianum*, *E. vitellinum majus*, *Galeandra Baueri*, many *Lælia* *pumila* *Dayana* and *L. prestantis*, and scarlet *Sophronis grandiflora*, as also the neat little orange-coloured *S. cernua*, and odd plants of many other things.

OTHER PLANTS.

The bright and interesting display is not confined to Orchids at the Royal Exotic Nursery, for all the other departments have their houses of flowers, such as those devoted to the winter Carnations, the Bourvardias, the grand collection of Pitchers (always equal in beauty to flowering plants), and the *Rhododendron*-house, which is never without flower. At present there are some good examples of *R. Empress*, *cerise* on orange; *R. militaire*, orange-scarlet; *R. Jones Perfection*, lilac-rose, with white tube; *Indian Yellow* and *Gloria Mundi*, reddish-yellow, with light tube; and one or two of the new double-flowered varieties.

In one of the plant-houses is a charming group, made up of a number of the lovely *Amasonia punicea*, with its tall spikes of sulphur-yellow flowers and brilliant scarlet bracts, mingled with a number of the feathery-fronded *Nephtolepis rufescens bipinnatifida*, and producing an indelibly charming effect. Also of extra interest is a good batch of the crim-on-flowered winter *Begonia* John Heal, each flower of which lasts a fortnight, and there is a continual succession of its pretty sprays. Visitors also should not fail to note the roof of the entrance cool-house, which is covered for about 85 feet with mingled white and red *Lapageria*, which has been flowering all summer, and is still a sight worth seeing.

TOBACCO CULTURE IN JERSEY.

I HAVE, with many others, tried the cultivation of Tobacco with a view to profit in this much favoured climate, and successfully, as far as the growth of the plants and development of the leaves have been concerned; but, I have entirely failed in the curing and preparation for use. The land being well prepared, the plants, raised and planted out carefully at 3 feet between the rows and 2 feet between the plants, grew vigorously to the height of 3 feet—when I stopped them for the development of the leaves many of which exceeded 2 feet in length and from 8 to 16 inches in width—presenting every desirable feature of fine growth. Success seemed within my grasp! A tobaccoist in the town of St. Heliers was quite elated, and undertook the task of drying and preparing for use, but "there is many a slip 'twixt the cup and the lip." After trying them up, in neat bundles of ten leaves, and hanging them up, in a cool shed, to dry gradually, and then placing them layer upon layer in a large case for fermentation, we had Tobacco of a fine colour, but no flavour. One cigar of South American produce was worth one hundred of those manufactured from the leaves. I have not repeated the experiment. It was quite evident that sun-heat was the element wanted. The process of drying was too long, and the nature of the Tobacco, and with it the flavour, evaporates in the manufacture. It was as flavourless as most of the Tobaccos grown in Normandy and Brittany. To the numerous propositions which might be advanced as to why this was not done, or that was not done, an easy reply can be made. All was done that could be done, but we had not command of the elements, and could not command the sun to shine when it was required. The late John Diamond, of Exeter, was of opinion that to grow exotic plants in Western Europe it would be necessary to import the tropical climate with the plants, and he was pretty correct in his judgment. I am quite convinced it is useless to grow Tobacco in England or its immediate dependencies, except as an ornamental border plant. The variety I grew was *Nicotiana sanguinea*, and a beautiful plant it is, with its bold stem, fine outstretched leaves, and pretty pale rose-coloured flowers. It seeds very freely, and I have, most seasons, some

specimens of it growing in my nurseries, as accidental plants, the seeds being carried about with the manure. I will gladly send a small packet of the seed to any horticulturist who is desirous of proving for himself the correctness of what I now advance on the subject. A fine season, other circumstances being congenial, will produce large plants, which are so ornamental that they amply repay the little trouble attending their culture; but growing the plants, curing, and manufacturing the produce in an acceptable and profitable manner are very different processes. [See pamphlet by Messrs. Carter & Co. on this subject. Ed.] *C. B. Saunders, Jersey.*

THE WHEAT CROP OF 1886.

WE are indebted to the kindness of Sir J. B. Lawes, Rothamsted, for the following important paper on our Wheat crop:—

Before harvest there was a very general opinion expressed by contributors to the agricultural journals that the Wheat crop of the country would be considerably below the average in yield per acre. At Rothamsted the results of threshing, both of the farm and the experimental crops, show a produce considerably above what I anticipated. Two fields of Wheat after red Clover each give about 50 bushels per acre, and the figures in the following table, which records the results of the experimental crop of 1886, the forty-third in succession on the same land, confirm the yield of the ordinary farm crops.

Harvest.	Unmanured Plot 7.	Manured Plot 8.	Artificial Manures.			Mean of Plots 7, 8, & 9.	Manured Plot 9.
			Plot 7.	Plot 8.	Plot 9.		

Bushels of Dressed Grain per acre.

Average 34 years, 1850-85	11½	31½	33½	40½	40	27½

I may observe that although the average yield of the selected plots of the present year differs but little from that of 1885, yet there was a very marked difference in the yield of the individual plots which contribute to the average in the two seasons. Thus, the unmanured plot gave only 9 bushels per acre this year, against about 15 bushels last year; and the dunged plot gave 36½ bushels this year, against over 40 bushels last year. On the other hand, each of the three artificially manured plots has yielded considerably more this year than it did last year.

An explanation of the great difference in the yield by the same manures in the two seasons is to be found in the difference in the characters of the seasons themselves. During the five months, September to January inclusive, the rainfall at Rothamsted amounted in 1884-85 to 12 inches, but in 1885-86 to 17½ inches; and during the same five months the drainage passing through our 5-foot soil drain-gauge amounted in 1884-85 to only 7½ inches, but in 1885-86 to 12½ inches. We should expect, therefore, that the soluble matters, and especially the nitrogen as nitrates, in the soil of the unmanured plot, and in that of the

* Equal to 59½ bushels, at 61 lb. per bushel.
 † Equal to 24½ bushels, at 61 lb. per bushel.
 ‡ Equal to 27½ bushels, at 61 lb. per bushel.
 § Equal to 26½ bushels, at 61 lb. per bushel.

plot where dung is applied in the autumn, would be much more washed out in the winter of 1885-86 than in the previous year. The loss by washing out would, however, be proportionally much less in the case of the artificially manured plots, which receive only a small proportion of their nitrogenous manure in the autumn, and the remainder not until the spring. It is evident, however, both from the produce per acre, and from the higher weight per bushel of the grain, that the summer of 1886 was more favourable for the Wheat crop than that of 1885.

Taking the foregoing facts into consideration in forming a judgment of the Wheat crop of 1886 over the country at large, it may be concluded that, on fallow land and on land in poor condition, where the crop would depend largely on the natural resources of the soil, the yield would be much below that of 1885, and much below an average; it would also generally be so on light lands subject to much drainage. On the other hand, on heavy soils, especially when highly farmed, we should expect that the yield will be above that of last year, and above the average; indeed, that in some localities very heavy crops have been grown. Speaking generally, too, spring-sown artificial nitrogenous manures ought to have given remunerative returns to the farmer in the season just past.

With a season affecting the crop so differently according to the character and condition of the land, it is somewhat difficult to strike the balance, and to decide how far the crop of the country at large is above or below the average. I propose, however, to adopt the figures given in the table without modification, and accordingly to estimate the average crop of the United Kingdom at 29½ bushels per acre. The result is seen in the following calculations. The area under Wheat in the United Kingdom was, during the past season, about 200,000 acres less than in 1885, and amounted to only 2,358,372 acres. This area, at 29½ bushels per acre, gives an aggregate produce of 8,622,798 quarters; which, deducting 2½ bushels per acre for seed leaves only 7,959,506, or scarcely 8,000,000 quarters for consumption. The estimated average population for the harvest year September 1, 1886, to August 31, 1887, is 37,048,347; and allowing a consumption of 5·65 bushels per head, the total quantity of Wheat required to feed the population will be 26,415,395 quarters, or say in round numbers 26,500,000 quarters. Of this, according to our estimate, only about 8,000,000 quarters will be available from home produce, leaving a probable requirement, from stocks and imports, of about 18,500,000 quarters. *J. B. Lawes, Rothamsted, October 22*

COLONIAL AND INDIAN EXHIBITION.

COLONIAL PAINTINGS, PHOTOGRAPHS, AND DRAWINGS.—A most interesting and bulky volume might be produced on the photographs and paintings of Indian and Colonial scenery exhibited in the different courts of the Exhibition.

New Zealand.—The collections of New Zealand paintings will not readily be forgotten, especially those of the celebrated Pink and White Terraces, which have become famous, if not historical, on account of the recent eruption.

New South Wales.—The photographs also are of unusual excellence. The New South Wales collection of paintings will also be well remembered, many of them giving vivid impressions of characteristic vegetation, especially of forest scenes in which the various species of Eucalyptus ply a prominent part. The splendid set of water-colour paintings of Australian plants by Mrs. Ellis Rowan will be especially valued for their general beauty and accuracy of drawing.

Trinidad shows some instructive photographs of the growth and preparation of Cocoa (Theobroma cacao), the staple product of the island; while on a screen between the Trinidad and the British Guiana, courts is a series of excellent photographs, several of which illustrate the cultivation and preparation of Sugar, including a general view of a Sugar plantation, a field of young canes, banking and planting, weeding, passing canes through the mill, view of manager's quarters—a really fine house, behind which are the works, and in front and around some tall Palms and various tropical plants—apparently very comfortable quarters, which is fully confirmed by another photograph of the interior of the manager's parlour, the appointments of which are even luxurious. This series is both interesting and instructive. One pho-

tograph which cannot fail to attract attention represents a portion of a trench 3 miles in length filled with the Victoria regia Water Lily, the circular leaves of which are so thickly grown together as to form a covering from bank to bank. Three miles of this magnificent aquatic must be a splendid sight when in flower.

Straits Settlements.—In the Straits Settlements a collection of photographs of buildings and some of the principal economic plants are shown, amongst others a group of Sago Palms at Singapore, an avenue of Cocoa-nut Palms, also at Singapore; a Tea plantation, in which the plants strike us as being very wide apart, not only in the rows but from each other. That illustrating the preparation of Gambir (Uncaria Gambir) is of considerable interest. Outside the thatched huts, which are shown on either side, is spread the Gambir to dry on light Bamboo frames. Another photograph shows a very fine group of young Betel-nut Palms, the trunks of which are remarkably straight and slender. A Pepper plantation, with the crop in process of harvesting, is shown, as well as Liberian Coffee trees in full bearing.

Ceylon.—In the Ceylon court, besides others of special trees and characteristic vegetation, the series illustrating the preparation of Tea is extremely good, and will be found very useful.

Natal.—In Natal there are a large number of photographs of very varied subjects. Those bearing on subjects with which we are most interested are amongst a series exhibited by Mr. G. T. Ferncyhough, of Pietermaritzburg; one represents the smoking of Dukka, or Hemp (Cannabis sativa), or, as the Kafir calls it, "Isangu," Dukka is described as being a "corruption of the Dutch work for the weed." The following description is given of the photograph:—"The plant grows wild all over Natal in waste places, and produces large crops of seed, but is useless for fibre—at least, so far as experiments have gone, and the natives alone make use of it. At a certain stage of its growth, i.e., when the flowers are fully out, branches are cut off, and allowed to dry in the sun, and are then tightly packed in bundles, wrapped round with grass matting, when it is ready for use. The pipe of the Kafir is a species of hookah, and is called 'Igadu.' It consists of a bullock's horn, in which about half-way up is tightly inserted a hollow stick in a slanting direction, which reaches nearly to the bottom of the horn. This stick is surmounted with a bowl or pipe-head, made of a softly cutting green-stone—"soap-stone," which is very heavy. The pipe being filled with 'Isangu,' or Hemp, the horn is filled with water, and the smoke is drawn up into the mouth; several puffs are taken, until a volume is secured, which is retained for a time and partly swallowed. This soon produces spasms, and results in a most violent fit of coughing, that would kill any ordinary white man. This is the luxury sought for, together with the stupefying and soothing influence of the narcotic contained in the plant. The fit of coughing having subsided, the saliva generated is then passed through a long hollow reed, and a series of bubbles results which are formed into circles, representing kraals, or into strings and other shapes, and according to number, size, and other indications are taken as signs of future wealth, number of wives, and other items interesting to the childlike mind of the Kafir. This continues until they have had enough, and sleep or go away. The smoking of this wild Hemp is the most noxious and injurious habit that the native indulges in."

While writing of Natal it may be well to mention that the exhibits of Tea grown and prepared in the colony have attracted a considerable amount of attention, and that the Tea is now on sale in the Natal court. We have had an opportunity of tasting this Tea, and find that the quality is very good. The only fault is that it is a little too much roasted. This, of course, will be readily improved upon, and there seems no reason whatever against Natal becoming a regular Tea-growing country. Numerous samples of Tea from different estates are exhibited, and it is worthy of note that the China Tea from one estate—namely, that of Mr. Brickhill—was obtained from plants introduced from the Royal Gardens, Kew, twenty years ago.

FRUITS, &c.

Amongst a fine collection of preserves from native fruits those exhibited by Messrs. Jameson & Co., of Durban, attract most attention, though from the fact of their being in sealed tins the public are unable to

see what they are like, still less to judge of their value. Mention may, however, be made of three of these from characteristic tropical fruits, namely, the "Amatuogulu" (Carissa [Arduina] grandiflora), which is of a dark reddish colour, not unlike Plum jam in appearance, but with a less decided flavour. The Papaw (Carica papaya), about the medicinal properties of which so much has been written of late; this produces a fine soft preserve of a yellowish-green colour, and a slightly acid taste. The Grandadilla (Passiflora maliformis) has, perhaps, the most distinct and agreeable flavour of either, having a slight trace of Pine-apple; one objection, however, is the presence of the very numerous black seeds, which cannot readily be crunched between the teeth, nor can they readily be ejected, inasmuch as the pulp clings to them with great tenacity. It is interesting to see what can be done in the matter of preserve-making from tropical fruits; and though few, if any, can ever approach the best known English fruits, the foreign produce might be made to supplement that of our own country. Though it may not be practicable to import fresh fruits in any quantities into England from distant countries, there seems to be a field for tropical candied fruits, which might be brought in tins or jars, as well as for whole fruits preserved in syrup, and hermetically sealed in a similar way.

The Natal exhibits of vegetable food substances generally are very interesting, and great credit is due to Mr. Morton Green for his readiness in making the exhibits known, and assisting by the help of samples to develop the resources of the colony. *John K. Jackson, Curator, Museums, Royal Gardens, Kew.*

SCOTCH NOTES.

ERICAS, &c., AT MILLBANK, EDINBURGH.

MILLBANK, the seat of W. Syme, Esq., situated on the outskirts of the south-western suburbs of Edinburgh, is a place of much interest to gardeners and others with a partiality for Heaths and other shrubby greenhouse plants. Mr. John Patterson, the gardener, is a lover of the classes of plants alluded to, now rarely seen, and has earned for himself a high reputation as a cultivator of them. His Ericas are especially good, and the collection is rich in varieties that are seldom met with in good condition. On the occasion of a recent visit we noted fine specimens of E. Marneckiana, E. retorta major, and E. Aitoni turgida in bloom. The plants averaged about 3 feet in height and diameter, and were perfect in every way, and being covered with bloom, were a grand show in themselves. Other remarkable specimens in the collection, but not in flower, were E. Bothwelliana alba, a very fine plant about 3 feet by 3 feet 6 inches; E. Paxtoniana, about the same dimensions. E. Victoria, E. Lindleyana, E. profusa, and E. Lowii are rather smaller plants, but remarkably well grown, and promise to rival in size at no distant date the larger specimens above-named. Of newer and more rare kinds we noted the following:—E. obata, E. Turnbullii, and E. Fairreana, in very healthy half-specimens, and a small plant of the very rare E. Lady Mary, raised by the late Mr. Turnbull, of Bothwell Castle, and which has, we think, never passed into commerce, though he regarded it as the best among the many he had raised during his long career.

Azaleas are a great speciality with Mr. Patterson. Many specimens of great size but of only good sorts are grown in an easy and natural style, yet compact and thoroughly balanced all round. All are splendidly set with bloom-buds, giving promise of a rich display of flowers over many months, as the stock is grown in batches so as to prolong the season to the utmost. [If our correspondent or Mr. Patterson would kindly furnish a paper on the cultivation of the Heaths and other hard-wood plants, as practised at Millbank, it would doubtless be appreciated by our younger gardeners. Ed.]

Orchids are grown to a limited extent—a few only of the best genera and species being attempted. Some splendidly flowered pans of Pleione lagenaria, and a few Odontoglossum Alexandræ were the only sorts in bloom. Amongst the latter was a very distinct form, with pure white flowers, having a few large rose-coloured spots on the sepals and petals.

Griffinia hacinthina was well bloomed in one of the stoves. This charming Amaryllid should be more

widely known than it is; flowering as it does at this season when flowering plants in the stove are by no means plentiful, it is most useful, and the bright blue-white shaded flowers are most attractive.

MESSES. LAIRD & SONS' WEST COATES NURSERY,
EDINBURGH.

We were very pleased to observe plants of some of the newer Ferns in the above nursery the other day. Amongst these *Davallia tenuifolia* Veitchiana is undoubtedly a gem; the gracefully arching fronds and delicate lace-like pinnules mark it as one of the most elegant and pleasing of Ferns. *Nephrolepis Bausei* is perhaps the most distinct and pleasing form of this popular genus of Ferns. It is of dwarf habit, and the pinnæ are deeply cut or pinnatifid, the points of the segments being finely tapered and more or less reflexed, giving a peculiar and charming distinctiveness to the plant. *Davallia retusa* appears to be a very free-growing species, and is certainly one of the most characteristic and elegant of its class. The very openly tripartite fronds exhibit the pretty red colouring of the stipules well in contrast with the light green of the comparatively large pinnules. The latter are of peculiar form, being very distinctly triangular, or more frequently rhomboidal. *Gymnogramma schizophylla gloriosa* is one of the most elegant of Ferns, and is very distinct from any of the varieties of the type. It is dwarf, compact, and even dense, yet extremely graceful in habit, a matchless basket Fern. *Adiantum cuneatum elegans*, if there are no spurious forms of this highly-rated variety in circulation, we must say we are disappointed with it. The specimens at West Coates Nursery differ from the ordinary forms of the type only in being more loose or leggy, imparting rather a tangled than an elegant aspect to the plants. *A. monochlamys*, a very pretty dwarf growing Maidenhair, with subglaucescent pinnules very closely set on the fronds. It is a greenhouse species.

Vallota purpurea magnifica is a brighter and better thing than the old well known type. The flowers are larger, the perianth segments more full and rounded, giving the individual flowers a more symmetrical outline. The colour is soft vermilion and lacks the purplish tinge that suffuses the flowers of the ordinary form, and the throat or tube of the perianth is striped with pure white. *V.*

DENDROBIUM PHALÆNOPSIS.

THIS (fig. 110) is one of the showiest of the East Asian species of *Dendrobiums*, and is allied to the *D. bigibbum* section. The stems are slender and erect, about 1½ foot in height, and bear near the top eight or ten lanceolate leaves. The racemes, which are terminal, on erect peduncles, 10 inches long, carry about fifteen flowers from 2 to 2½ inches across. The sepals are oblong ovate, magenta with a whitish centre, the spur deep purple; the petals are rhomboid obovate, of a warm magenta-purple, the lower half paler in the centre; the lip is of an intensely rich rosy-purple, an inch long, acute, with the broad lateral lobes meeting over the column, its base forming at the hinge a second spur and the front lobe deflexed, magenta with maroon-crimson veins; the throat of the same colour; the veins of the throat are thickened and covered with dark papillæ. It flowers in April.

The Rosery.

HOW TO PLANT ROSES.

NOVEMBER is the month in which this operation is best performed, but the best way to perform the operation is not well known by some Rose amateurs. Everybody desires to plant Roses in his garden; they are planted in the full expectation of a splendid blooming season; but those expectations are not so fully realised as they might be, if careful preparations had first been made. It is not sufficient merely to dig a hole large enough to contain the roots, and to fill in the soil again, however carefully it may be done. Good manure is necessary, and it must be applied in the right way. Pig manure is good, but I have always used for Roses stable and cow manure in about equal proportions, and find they do remarkably well with it. Recently we have tried peat manure

from the stables. If care be taken not to use it too freely it seems to be a powerful manure, giving the dark Roses a good colour. Trench the ground 2 feet deep if possible, and place two layers of manure in during the operation, one at the bottom of the trench, and the other 9 inches below the surface. Those who have to deal with light sandy soils may plant in wet weather almost as soon as it has ceased to rain. In medium clay, or clay soils, the case is quite different. It is necessary to wait until the ground is comparatively dry, because disturbing it in wet weather may bring it into a state of hardness most unfavourable to the healthy growth of the Rose plant. Carelessness in planting, or in not choosing a favourable opportunity, may be a cause of failure more annoying to the cultivator, because it might have been avoided by a little patient waiting. The ground is not in a good state for planting if it sticks to the boots or spade. Before planting examine the roots, and cut out the suckers quite close to the stem. If not cut quite back, fresh eyes will start, and the last state of that plant will be worse than the first. Cut back any very long roots, also any bruised portions. We dig out the hole large enough to hold all the roots spread out straight, and we never plant a Rose without placing some good moderately dry compost, prepared in the potting shed, amongst the roots. Turfy loam, with a third part of decayed manure, answers well. All standard

budded Roses sometimes become an intolerable nuisance, owing to their tendency to produce suckers. In the hands of the inexperienced a choice hybrid perpetual Rose will become in time a vigorous bush of the Manetti, from which all trace of the Rose itself has departed. Hybrid perpetuals and Tea Roses should be grown on their own roots—at least, all the vigorous kinds.

ROSE CUTTINGS.

They are easily enough propagated from cuttings taken off in August or September, and the cuttings planted in a shady place under a close hand-glass—they form roots before the winter. Tea Roses may be successfully treated in this way. If cuttings were put in during the month of August, they would now be ready to be potted singly in 3½ or 4 inch pots. They could be grown on during the winter in cold frames, and be planted in the open ground in April. A quantity of such plants put out in rich soil would produce a plentiful supply of Roses and Rose-buds all through the summer and autumn.

DRAINAGE.

One thing more must also be mentioned in reference to planting, and that is drainage. Dig a hole 2 feet deep during the winter in wet weather; if drainage is insufficient, water will stand in the hole.

FIG. 110.—DENDROBIUM PHALÆNOPSIS.

Roses should have a stick placed to them at the time of planting. In November it is had management to have to tread on the ground oftener than is absolutely necessary. One successful cultivator would never tread in the soil round the roots in November; he preferred to let it settle gradually. I think he was right. Place over the surface of the ground round the base of the plants some decayed manure, and the operation of planting is completed.

STOCKS OR OWN ROOTS?

The question as to what is the best stock, or whether the best is not their own rootstock, is one on which opinions are still very much divided. It would have been settled long ago if each system of culture did not possess sufficient merits of its own to sufficiently recommend it for general adoption. Standard Roses, of course, are budded on the Dog Rose. The stocks are planted in November or December; strong shoots will be produced in the spring near the top of the stem, and close to the base of these the buds are inserted in July. The seedling Brier answers remarkably well either for hybrid perpetuals or Tea Roses. Hybrid perpetuals are also budded in July or spring grafted on the Manetti. In Mr. W. Paul's nursery at Waltham Cross I saw during the summer quantities of Tea-scented Roses which had been worked on the Rose de la Grifferie. Mr. Paul also showed me a large quarter of Roses on their own roots; and he says the demand for these is increasing. One cannot wonder at this, for

I had to do with a good garden of clay soil, which I was told had been well-drained some twenty years previously, and that it was all right. The ground was prepared for Rose beds in the autumn without taking any further notice of the drainage, but I found on digging out round holes 3 feet wide and 2 feet deep for Coniferous trees, if they were open twelve hours a few inches of water stood in the bottom of some of them, and in order to be secure the whole garden was drained. Tea and other Roses have done splendidly, but success could not have been expected if their roots had been in water for a portion of the year. On the recommendation of Mr. Geo. Paul I planted four years ago in November a raised bed with Tea Roses. The bed was raised about a foot higher than the surrounding lawn, its sides were sloping, and they were neatly turfed over. The Rose beds are, I think, even more effective made in this way, and the chances of their being injured by wet are considerably reduced. Those who have had to do only with light soils over a gravel subsoil have no idea how difficult and unpleasant it is to deal during wet weather in winter with heavy clay soils unless they are well drained. No wonder that rows of standard Roses neatly planted on each side of the walk do not succeed. Examine the roots. They are in a puddle of water. Lime rubbish or other loose material put into such holes drain the water into the roots, not away from them. It is useless trying to grow Roses or anything else in heavy undrained soil. The effect of a few 3-foot deep drains and 2-inch pipes

laid in the bottom with a good outlet for the water, is astonishing.

POT ROSES.

The plants intended to flower in March should be pruned now. Before doing so let the soil in the pots be comparatively dry. This prevents any of the sap from exuding at the cut places. Do not give any water for a month unless the soil should become dusty dry, which is undesirable. I have previously stated that August is a suitable month in which to pot them, and if that was done they will require no further attention until they are placed into any glass-house in December. We have no better place for ours than an early vinery; and a very good place it is.

They require exactly the same treatment as the Vines—a rather moist atmosphere and a temperature of 45° at night; this is kept up for two weeks, when it is raised two or three degrees, to be gradually increased to 55°. Usually the Roses start earlier than the Vines. They have a much better chance, as the pots containing them are either placed on a bed of fermenting material in the house or over the hot-water pipes. We have Tea Roses flowering nicely in pots now. The plants made good growth and formed their flower-buds since they were repotted in August. But that is no great feat, considering that to-day (October 23) we have been cutting good Tea and other Roses on our raised beds out-of-doors. Now that cold and wet weather has set in with little sunshine, the outer petals decay on the buds, and prevent the perfect expansion of the flowers. Were it not for the inclemency of the weather, we should have quite as good a display of Tea Roses on our plants out-of-doors now as we had during the height of the blooming season. Some of the plants have scores of buds on them ready for expansion. The hybrid perpetuals are not to be named beside them for profusion of bloom. *J. Douglas.*

CAPPARIS SPINOSA.

THIS ornamental, as well as interesting plant, is now flowering freely in the Cambridge Botanic Garden, whence specimens were forwarded for the accompanying illustration (fig. 111). Though well known and occasionally seen in flower years ago, it has latterly had but little attention. The flowers, however, as may be imagined, are very beautiful, being about 3 inches across, with large pure white petals and numerous loose stamens, of which the filaments are long and conspicuous, white below and rich purple above. The sweet perfume, too, adds not a little to the attractiveness. This specimen, though quite young, covers an area of about 3 square feet, and the best shoots of this year are 3 feet long, each leaf towards the extremities and for some distance back bearing a bud. It was planted, when quite small, about two years ago, when Mr. Ewbank drew attention to the loveliness of the flowers.

I then gave some hints as to management, and having no flowering specimen, commenced here the same treatment with the result as above mentioned. A considerable number of flowers have been produced this year, and they will continue to open, no doubt, so long as weather permits. The specimen is growing at the foot of the south wall, where it was planted on a low mound of broken bricks and good soil. A woodwork arrangement was made to carry a light for winter protection; it scarcely amounts to a frame, as plenty of air is always required, and for this reason the light is tilted up in front almost at all times when in use. It could however, be closed in if the weather were very severe, but the plant may be considered hardy against a wall, further protection being required rather on account of wet than cold. The side shelter from cold winds is no doubt advantageous. The light remains on through the spring and until summer has fairly set in, as any roasting the plant may get before then is likely to be rather beneficial than otherwise. It will go on again as soon as protection from heavy rain is necessary in order to keep the plant dry to encourage the ripening of the wood. The Caper grows easily from seed, and cuttings taken from pot plants will strike, but it would perhaps be useless to put in cuttings from a plant growing freely in the open ground.

It is rather a curious fact that this plant cultivated in a pot with all due care scarcely grows at all, while planted out under favourable conditions it grows vigorously. *R. Irwin Lynch.*

FIG. 111.—CAPPARIS SPINOSA: THE CAPER PLANT.

Orchid Notes and Gleanings.

PHALÆNOPSIS VIOLACEA.

THIS handsome autumn-flowering Orchid seems to be one of the most varied in the genus as to the range of coloration, three forms having just been placed in my hands, no two of which were nearly alike. First a fine flower of the variety chloracea came from Mr. Burbridge, then the variety Schrederiana, from a plant which flowered at Kew; and lastly, a form which hardly fits the characters of any of the published forms, being somewhat intermediate between the latter and those varieties with light yellow sepals. The fact is that with such a variable species varieties might be multiplied to an almost unlimited extent, with a good series of plants under observation. The differences, however, are often merely those of individuals. The variety chloracea seems to me the most striking and effective of all, the pure white segments, faintly tipped with pale green, and the intense violet blotch on the inner half of the lateral sepals, forming a charming contrast. *R. A. Rolfe.*

ANGRÆCUM CAUDATUM.

While forming a companion plant to *A. Kotschyi*, of more recent introduction, this is abundantly distinct, notwithstanding its first-sight resemblance. Their similarity is all the more striking seeing that they are geographically so widely separated, *A. caudatum* being a native of Sierra Leone, while the other was introduced from Zanzibar, on the other side of the continent. A close comparison of the two, however, shows that they are widely distinct, and most resemble each other in the enormous length of the spur which is more or less distinctly twisted in both cases. *A. Kotschyi* is most marked in this respect, but individuals of *A. caudatum* vary. A plant in the East Indian house at Kew exhibits an open spiral twist of one turn, while the figure in the *Botanical Magazine*, t. 4370, shows an irregular and but ill-defined twisting, as did the plant exhibited at Kensington Oct. 11. The figure in the *Botanical Register*, t. 1844, has a straight spur or almost so. *A. caudatum* is further characterised by a remarkable twist of the pedicel which it has in common with *A. eburneum*, which has the effect of making the flower lie on its back with the labellum uppermost. *A. Kotschyi* does not appear to possess this, but has the labellum anterior, with yellowish-white fragrant flowers and very broad leaves, whereas, on the other hand, the leaves of *A. caudatum* do not exceed an inch in width, and the acuminate sepals and petals, together with the spur, are of a peculiar pale olive-brown. The labellum is pure white, suddenly and remarkably prolonged at the apex into a subulate greenish point. In all these characters it will be seen that the two species are remarkably distinct, and in no way to be confused one with another notwithstanding the similarity in the spurs. *J. F.*

CYRTOPERA REGNIERI.

The *Orchidophile* for October has a coloured plate of this Cochinchinese Orchid, introduced by M. Alexander Regnier. The flowers are produced at the same time as the lanceolate plicate leaves, and are borne on a raceme springing from the base of the stem. The individual flowers are about 2 inches across. The segments are oblong-lanceolate, pale primrose, the lip 3-lobed, the side lobes erect, the front lobe longest, white, with a yellow blotch.

LIPARIS ELEGANS.

A PLANT which has probably never been seen alive before in this country, and which up to the present moment is all confusion in the books, may now be seen flowering at Kew. Elegant it certainly is, but not very striking, a character possessed in common with the bulk of the genus. The flowers are numerous and borne in erect racemes, the colour being pale greenish-white with a deep reddish-orange lip. It was sent from Penang, by Mr. Curtis. The genus has recently been monographed by Mr. Ridley, of the British Museum, in the *Journal of the Linnean Society*. It is there correctly pointed out that *L. elegans*, Lindl., is a mixture, though the material was not sufficient to clear the matter up.

Curtis' plant has now solved the difficulty. Lindley's type sheet consists of one piece of the true plant (the only good flower being admirably drawn on the sheet), a flowering piece of *L. longipes*, Lindl., and several fruits of a third species. The description is compounded of the three, but as that of the flower, on which Lindley relied for its distinctness, is taken from this species, his name may be retained, with the character amended. Lindley's plant was sent from Penang by General Porter. Mingay, who also collected the plant, has written on his ticket, "Found growing on stones near the waterfall, Penang;" and, as recorded above, our present plant is from the same spot. The following description is taken from the living plant:—Pseudobulbs ovate, somewhat compressed, with one to three leaves. Leaves lanceolate-linear, acute, narrowed at the base, 3–8 inches long. Scape erect, 1–1½ foot high, terete; racemes 6–10 inches long. Flowers numerous, about six to the inch when expanded. Bracts subulate, acute, a quarter of an inch long. Sepals and petals pale whitish-green, subobovate, one-eighth of an inch long, the former linear-oblong, the latter narrowly linear. Lip deep reddish-orange, concave-oblong, retuse, and minutely denticulate above, one-sixth inch long. Column slender, with a pair of minute wings above. Fruit erect, pyriform, with six distinct ribs, a quarter of an inch long. The fruits on Lindley's type sheet are pendulous, and more than twice as large, but I do not know what it can belong to. The plant belongs to the section Coriifoliae, and to the group Densiflorae. It may stand next to *L. vestita*, Rehb. f., the one other species of this group with a retuse apex to the lip. *R. A. Rolfe.*

TRESCO.

TRESCO is not so rich in native flora as the two larger islands, St. Mary's and St. Martin's, but it contains naturalised plants, e.g., *Mesembryanthemum edule*, in greater number. Among the common wild flowers are the Horned Poppy, Sea Holly, Tree Mallow, *Euphorbia paralias*; *Lavatera sylvestris* and *Acanthus mollis* have also been found. Curious enough, the Nile Lily might perhaps be put down as a garden escape. *Agave americana* and the New Zealand Veronicas are to be seen in most of the cottagers' gardens. The cultivated fields are divided from each other by hedges of Tamarisk, "vastly pretty" in its flowering stage, and *Escallonia macrantha*; *Myoporum laetum* has been employed as a hedge plant with great success. In a former number I mentioned the somewhat curious fact of the Ling and Gorse being about the same height in a very wind-swept part. The blaze of colour when both are in flower together, as they are throughout August, is equal to that of any mainland ribbon border.

In the Abbey gardens there is always something fresh to interest, no matter how often one may tread its beloved alleys and *cul-de-sacs*. An *Agave americana*, the flower-scape of which was only beginning to burst from durance vilest (at least, mortals would call twenty years captivity so) on Whit Sunday, is now 27 feet high, and will probably grow yet another 3 feet. The horizontal flower-stalks number over forty. As Whit Sunday was the 13th of June, and we measured the scape on September 11, it must have been growing at the rate of 2 feet per week. *Dasylirion acrotichum* has not flowered here as yet, though this desirable result cannot be far off if the size of the plants be any index. *Puya chilensis* and *Fourcroya longeva* can be seen in flower every year.

Flowering plants are scattered about in a charmingly ingenious manner. Mr. Vallance must be a "pawky chiel" to have at his command so many surprises. His taste in bedding-out is technic enough when he chooses, however, e.g., the *Dracæna* flower garden, and his bed of *Portulacæ* with a procumbent *Erythrina crista-galli* in the centre thereof. What is called the Hop-circle could be copied in other gardens to their gain. It consists of concentric circles of Bay, Hops, and Fuchsias, one of each in the order named. The Hops are trained in festoons along iron and wire-work. The *Fuchsia* hedge is about 3 feet high, very dense, and covered with bloom. A path divides the circle into semicircles. On the one side the vacant spaces are filled with Dahlias, which in Scilly are left out through the year; on the other are divers flowering plants and a fine *Aralia papyrifera*, which a tall *Dahlia imperialis* hides close up to, much to the satisfaction of both, apparently. Only those who know the Hop as a

trailing plant, and the beauty of the old-time species of *Fuchsia* could cordially realise any word painting that would adequately limn this fair garden within a garden. The rockwork, on which the *Agave* stands, is brightest when the *Crassulas* and *Felargoniums* are in their heyday. Still, there is always something in bloom every month. The most attractive plant now, perhaps (September), is *Arctotis grandiflora*; this is the *Arctotis* Mr. Harpur-Crewe was so fond of, and tried to induce others to grow. An unusual form of vegetation is to be seen growing amongst the rocks in the shape of the *Equisetum-like* foliage of a rather tall *Casuarina*. Close by this *Casuarina* is a *Dracæna Draco*, decidedly dwarf for his years. The *Eucalypti* grow well enough in Scilly, but when they get above protection immediately become wind-scorched. A large tree has been, unfortunately, almost killed by exposing it to the winds. In Portugal *Eucalypti* are planted as screens against the winds from seaward, but the young plants and saplings there are reared in exposed places, and hardly ever staked, as any friction is highly detrimental to them. The same fate that fell upon the great *Eucalypt*, which Buddley's *Thorough Guide* mendaciously states to be the second tallest in Europe, also awaited an ambitious *Araucaria Bidwilli*; the headless tree is now enclosed in a rough casing of tubular form, over which *Mitlenbeckia complexa* has spread in a rampant fashion. This climber is the most luxuriant of all the alien weeds that have obtained a footing in these gardens. Our illustration, fig. 112, shows how well the Tree Ferns, *Dicksonia*, thrive in the garden when protected from the fierce wind, *Vagabonda*.

TREES AND SHRUBS.

SPERIA THUNBERGII.

THE usual flowering time of this graceful shrub is spring when the plant is leafless. Where planted in the background on the rockery at Kew it flowers annually and profusely, but the same plant flowering in the second week of October, while the leaves are still fresh and green, seems a rather unusual phenomenon. The fascicles of flowers are by no means numerous, but their presence is sufficiently significant to be noted. The beauty of the plant would be greatly enhanced if the foliage accompanied the flowers in spring, but the naked or leafless character of the plant at that season seems to be constant in its native habitats, judging from the *Flora Japonica*, i. 69, where an uncoloured figure is given, consisting of a leafy flowerless branch, and a flowering leafless one. It is widely distributed throughout Japan, in the valleys, and on the slopes of mountains and rocks. The native name, *Juki Janagi*, signifies white Willow—a comparison by no means inappropriate, owing to the slender, twiggy, and Willow-like habit of the plant. No record seems to have been made of its introduction to Britain in gardening books. I have known it for ten or twelve years. *J. F.*

CEDARS OF LEBANON RIPENING SEED.

We have several large Cedar trees here, which have this season ripened seed in quantity. The cones burst early in April, and the seeds are scattered about in all directions. A great many of them, after laying on the turf a few days, I found to have pushed forth a shoot, or an inch long, in search of earth. I picked up several, and had them potted in 3-inch pots, and have now twenty nice little plants, some of them 5 inches high. *H. Markham, Mereworth Castle, Maidstone.*

FORESTRY.

NOTES FROM THE COLONIAL EXHIBITION.

TO THE British forester the Canadian court is of particular interest, not only from the number of woods exhibited that have been found valuable as timber producers, and perfectly well suited for culture in this country, but as demonstrating in a practical manner many of the uses to which they are applied. Amongst these we took particular note of *Thuja gigantea*—indeed, we were delighted to see the timber of a tree that we have so often recommended for extensive planting in this country so clean, firm, and easily worked. A large specimen of some 21 feet in girth was exhibited, this being taken from a tree 250 feet

high, as well as numerous boards and polished sections of the same wood. Professor Macoun, of Ottawa, tells me that this specimen may be considered as about the largest, but that the average dimensions reached by this stately fast-growing tree are but little less. The larger trees, he likewise stated, were apt to be hollow, and that not unfrequently several stems issued from the same root, and that along the outskirts of the forests it was no uncommon thing to find the tips of such branches as came in contact with the ground taking root and throwing up stout stems much in the same way as the common Spruce does in this country. Rather damp, alluvial deposit suits this tree best; indeed, the Professor told me that it was almost unknown in the dry central plateau, but plentiful along the coast and lower parts of the rivers. As a substitute for the Larch in this country *Thuja gigantea* is fast coming to the front, it being of the easiest culture, extremely hardy, not at all liable to lose its leader even during the most severe storms, and a rapid timber producer. Here we have planted it very extensively, and with the best possible results.

Pinus Strobus, of which a large plank is exhibited, is considered the most valuable in a commercial sense of any of the Canadian Pines. The wood as shown here is remarkably clean and free from knots, light in proportion to its bulk, easily worked, and takes a fine polish. It is likewise remarkably durable, not at all apt to become twisted or bent, and is said to be more readily stained and to take paint better than almost any other wood in the section to which it belongs.

Here then we have in one of the most valuable lumber producing trees of North America, a Pine that is well adapted for culture in this country, a statement that is readily enough substantiated by the great size to which the tree has attained in various parts of our country. At Gwydyr Castle I not long ago measured one of several specimens that were growing in a rocky woodland and in by no means the best of soil, and found the girth at breast-height to be 9 feet 5 inches. None of the trees were less than 80 feet in height, with clean, perfectly straight stems, which were destitute of branches for nearly half their length. Various other examples of fast growth in this Pine might be adduced, which shows clearly that it is perfectly well adapted for culture in our soil and climate, and which, coupled with the fact of its being such a valuable timber producer, should be a warning to intending planters not to pass over so promising a tree in making their selections. Of *Abies Menziesii*—another tree that is quite at home in our island—there is a plank of huge size, it being fully 20 feet long, 3½ feet broad, and 6 inches thick. The wood seemed white and clear, and from its large size it must be valuable in the making of furniture, boxes, &c. *Pinus monticola*, of which a plank 18 feet long, by 3 feet 10 inches wide, and 3 inches thick, is exhibited, pleased us eminently, for its clean, well packed wood betokens strength and lasting qualities in a very marked degree. Being unpolished we were not able to form a good opinion as to how it would work under the tools of the carpenter, but a little experiment that we took the liberty of making, satisfied us that in this particular respect it was far from deficient. The wood we were told is highly valued, but as the tree is scarce and grows in almost inaccessible situations, it is but seldom that the chance of converting the timber is offered. In this country *P. monticola* does very well, but as yet no trial of its wood has been taken in hand.

Sorry indeed were we to know that our favourite *Abies*, *A. grandis*, is not highly spoken of, the wood being rather brittle and easily destroyed—quite the reverse of what we anticipated from specimens that have been cut up and manufactured on this estate. *Larix americana*, or rather the wood of that tree, pleased us well, indeed in colour, texture, and appearance when dressed up, it much reminded us of our commonly grown tree. In its native country the wood is highly valued, being in request for boat building, house-building, and shingles. Specimens of 60 to 80 feet, and a couple of feet in diameter, are commonly met with. It is not much grown in this country—a pity we think, for such an ornamental and valuable timber-producing tree would certainly be an acquisition.

Pseudo-Tsuga Douglasii is, however, perhaps, the monarch of all trees, and amusing was it to see how attractive to even the ordinary onlooker was a big slab of the wood, some 16 feet high, and 8 inches thick, that had been taken from a 300 feet high specimen that girthed no less than 25 feet. The bark was not nearly so rough as we expected, the thickness

nowhere exceeding 3 or 4 inches. A section from the same tree lying hard by was 18 inches thick, and 18 feet in girth, and showed well the graining of the wood, and large annual growths. How well this tree is adapted for extensive cultivation in this country, we have only to refer those who may feel interested to back numbers of the *Gardener's Chronicle*.

Adjoining this mammoth specimen is a very clean and large plank of the yellow Cypress, *Chamaecyparis naktuensis*, a tree that, although but little known in commerce, is, we were told, of great value, the wood being fine-grained and remarkably durable. From the plank exhibited we were forcibly struck with the very clean yellowish-tinted wood—a wood that we should be inclined to employ largely in the making of furniture. Immediately in front of this plank is a number of samples of thinly cut planks of Birch's-eye Maple and white Birch, these being almost as thin as sheets of broken paper. The former wood is much used in its native country for furniture-making, and as it does not warp, at least to any great extent, is employed in the making of out-buildings, portions of the offices in connection with the Canadian department being made of this wood. *A. D. Webster*.

(To be continued.)

The Flower Garden.

HARDY SUBJECTS.

CARNATIONS and Pinks yet unlifted should be potted up at once. Sandy loam is the best compost to use for them. Examine it carefully to see it is free from wireworm, which is very injurious to these plants. Although these subjects are perfectly hardy they are all the better for receiving the protection of a pit or frame. Let the pots be plunged to their rims in coal-ashes, guard against damp and give abundance of air, supplying water when absolutely necessary, to prevent flagging. The potting of all *Calceolarias*, summer flowering *Chrysanthemums*, *Violas*, *Pentstemons*, *Phloxes*, &c., should now be completed as the season is now over for successful rooting, although if the winter should prove an open one all these subjects will succeed perfectly.

SHRUBS.

The trimming of shrubs may now be taken in hand, but it is not good practice to thin them out much until the winter is past. If they be too freely thinned out at this early period and a hard winter follow they will most likely suffer severely. Where new shrub beds are in contemplation the sooner the plants are obtained from the nursery the better. Let the soil be trenched to the depth of 18 inches; if it be good a foot more will be all the better. Let the bottom be loosened up with a pick for another foot, but do not bring this subsoil to the top. This will secure ample drainage, but where subsoil is hard and retentive the beds had better be elevated a foot above the general level of the surface. No plants will thrive in water-logged beds. This is easily observed by the smallness of the leaves and their sickly colour. The sooner *Roses* are ordered from the growers the better, as those who come first have the first pick. Where fresh beds are to be made the soil will require to be trenched to the depth of 2 or 3 feet, a liberal quantity of fresh loam, charred rubbish, and well decayed cow or pig manure, to the depth of 1 foot, should be well mixed along with the top spit in order to secure fine bloom. Existing beds which it is deemed unnecessary to disturb may receive a mulching with good manure and a sprinkling of soil over all will secure a neat orderly appearance. *William M. Baillie, Luton Ho.*

PLANTS AND THEIR CULTURE.

FERNERY.

REMOVE such shadings as remain, for from this time forward all Ferns will be benefited by having as much light as possible; and the glass should be washed inside and out. The plants themselves should be carefully looked over for thrips, and be either dipped or sponge them at once if affected. The amount of water at the roots may be gradually reduced so as to bring them to a state of comparative rest; this applies to the general stock and specimens, but not to those that are required to supply cut fronds or for furnishing. Batches of *Adiantum cuneatum*, *A. gracillimum*, and *A. formosum*, which have been affording fronds for the above purposes should be laid on their sides to rest for a time. Start those plants which have just begun to move, they will come in useful later in the year. All *Gymnogrammas* and *Cheilanthes* ought to

be removed at once into the warmest, lightest, and driest part of the house; be careful not to over-water or syringe them, and remember that drip is very injurious. Any fronds which show decay should be cut off.

FILMY FERNS.

Any of the tender varieties, such as *Hymenophyllum vitatum*, *H. elasticum*, *Trichomanes alatum*, *T. auriculatum*, *T. maximum*, *T. spicatum*, or *T. olivaceum*, should be removed to a warmer place than the Filmy house proper for a few months. A lot of the varieties will make nice growths now; damp the floor of the house, dew or water them overhead but once a day, to induce a season of rest, so that by midwinter they can be left several weeks without water if standing in a cool house, proper to grow them in.

ROSE HOUSE.

The first plants which were placed in this house will now in some cases be coming nicely into bloom, and affording pretty materials for button-holes or sprays, and indoor decoration. If the pots have got well filled with roots, once a week liquid manure may be given freely, that is, at alternate waterings; plants that get starved at the roots being generally those most subject to mildew. Keep the plants well syringed, and if greenfly should make its appearance syringe them with tobacco-water which has been made the day before so as to allow the impurities to settle. This should be applied as soon as the open or half-open blooms are cut in the morning, then there is no sacrifice of bloom or bud by discoloration. A few *Maréchal Niels* can now be introduced, but all shy bloomers or delicate growers should be kept in the cool pit for a time longer. Hybrid perpetual *Roses* which have been forced previously and kept in pots should now be plunged up to the rims in ashes or cocoa fibre; the others that are required for the spring supply must now be potted up. At one time I used to grow my *Roses* in pots one season and force them the next, but now I pick out those plants with the ripest wood, and plunge them in ashes up to the rim on a large hot-bed of manure and leaves at about 80° bottom-heat. This causes active root-action, and the pots get well filled with roots by Christmas. As to the best diet that the seedling plants go to rest thus saving a season of labour with results that are equal. The following kinds force the best, viz. *Alfred Colomb*, *Anna Alexieff*, *Baroness Rothschild*, *Baronne Hiausmann*, *Boule de Nègre*, *Charles Lefebvre*, *Countess of Oxford*, *Dr. Andry*, *Duke of Connaught*, *Duke of Edinburgh*, *Ferdinand de Lesseps*, *Fisher Holmes*, *John Hopper*, *La Duchesse de Morny*, *La France*, *Madame Charles Wood*, *Marie Baumann*, *Senateur Valdes*, *Général Jacqueminot*, *Olga Marie*, *Victor Verdicq*, *Sir Garnet Wolseley*, and *Louis Van Houtte*. *A. Evans, Lythe Hill.*

FRUITS UNDER GLASS.

PEACH AND NECTARINE TREES.

No time should be lost in preparing the trees in the early and second house for forcing. The first step to be taken in this direction is to wash the glass and wooden work with warm water, and the other parts with hot lime, into which a few handfuls of flowers of sulphur should be stirred before being used. This done, cut out as much of the old wood as can be dispensed with, as well as superfluous and extra strong shoots of the current year's growth, and some of those that are left should be shortened back to a wood-bud where necessary to secure balance of growth. This object should never be lost sight of in pruning trees of any description. Then the trees—unless they have been perfectly free from blight during the past season—should be washed with a soft brush and a solution consisting of 4 oz. of soft-soap dissolved in a gallon of warm water with two handfuls of sulphur well mixed. This should be applied to every part of the tree, care being taken not to damage the fruit-buds. The shoots should be thinned out to about 5 inches apart, and these should be trained at an equal angle on either side of the tree, and should not be tied too tightly to the wires, otherwise they will not have room to grow. This done, prick over the surface of the border with a steel fork, remove the loose soil, and replace it with a mixture consisting of three parts of sound loam and one of lime-rubble and wood-ashes, following this with 2 inches thick of horse-droppings or short manure, and a good soaking of tepid water. If Peaches are required in May next, the house should be kept close towards the end of the ensuing month, and the trees be syringed two or three times a day with water a few degrees warmer than the temperature of the house according to the temperature of the weather, and only use the heating apparatus to prevent the temperature from falling below 40°. Trees in late and cold houses should in due time be attended to in the manner indicated. *H. W. Ward, Longford Castle.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Nov. 1	Sale of Dutch Bulbs, and 10,000 Liliun auratum, at Frotheroe & Morris' Rooms. Sale of Fruit Trees, at the Osborn Nursery, Hampton, by Frotheroe & Morris. Sale of Dutch and Belgian Bulbs, at Stevens' Rooms. Chrysanthemum Show of the Ealing, Acton, and Hanwell Horticultural Society. Chrysanthemum Show of the London Corn Exchange.
TUESDAY, Nov. 2	Sale of Nursery Stock, at Hollandby's Nursery, Groombridge, by Frotheroe & Morris (two days). Annual Sale of Nursery Stock and Herbaceous Plants, at Ware's Nursery, Tottenham, by Frotheroe & Morris. Sale of Roses, &c., at the City Auction Rooms, by Frotheroe & Morris. Show of Chrysanthemums, &c., at Havant (two days). Sale of Dutch and Belgian Bulbs, at Stevens' Rooms. Sale of Plants and Lilies, at Frotheroe & Morris' Rooms. Clearance Sale of Greenhouse Plants, at the Melbourne Nursery, Annetley, by Frotheroe & Morris. Chrysanthemum Show at Twickenham (two days).
WEDNESDAY, Nov. 3	Sale of 6000 Liliun auratum, from Japan, at Stevens' Rooms. Sale of Imported Orchids, at Stevens' Rooms.
THURSDAY, Nov. 4	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Sale of Nursery Stock, at Maidstone, by Frotheroe & Morris. Sale of Nursery Stock, at Sutton, Surrey, by Frotheroe & Morris. Chrysanthemum Show at the Crystal Palace (two days).
FRIDAY, Nov. 5	Sale of Established Orchids, at Frotheroe & Morris' Rooms. Sale of Nursery Stock, at Lee's Nursery, Hounslow, by Frotheroe & Morris. Sale of Dutch and Belgian Bulbs, at Stevens' Rooms.
SATURDAY, Nov. 6	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.

WE have often had occasion to allude to the GHENT SCHOOL OF HORTICULTURE, presided over by Professor KICKX, the Professor of Botany in, and Rector of the University of that city. In the absence of any such institution in this country many of our young countrymen have availed themselves of the opportunity of procuring in the old Flemish city a practical training in their art, together with instructions in the principles of science, on the successful application of which, directly or indirectly, substantial progress alike of the individual and of horticulture in general depends.

That institution is, as we have said, presided over by the Professor of Botany, and among his colleagues are names known wherever horticulture is known—RODIGAS, VAN HULLE, BURVENICH, and PYNÆRT. Those who think that an ounce of practice is better worth than a pound of theory will be reassured by reading the names of these four gentlemen, happily compared by the late Dr. LUCAS, the pomologist, to a four-leaved Shamrock. We have not on this occasion to concern ourselves with the working of this school, nor with the details of the public work for the promotion of horticulture effected by these gentlemen with the potent assistance of the learned and genial Count OSWALD DE KERCHOYE. Our task to-day is different. We have to call attention to the way in which horticulture has been honoured in Belgium in the person of one of its most indefatigable promoters; and when we have told our story, we shall leave it to our readers to wonder why it is that horticulture in this country does not receive the same public recognition that it does in other countries. Fancy the Vice-Chancellor presiding in Oxford on a similar occasion! That EDWARD PYNÆRT should be the recipient of honours and flattering testimonials is no subject of wonder to those who have the privilege of his acquaintance. His indefatigable labours, his zeal, his transparent honesty of purpose, his ready wit and inexhaustible good nature, associated with his other excellent qualities of head and heart, are certain to win the suffrages of all to whom they are known. That this is so was shown by the "Manifestation" in his honour in Ghent on Sunday last. In the concert-room of the Casino—a building well known to the frequenters of those "Quinquennials" which are attended by the horticulturists of all nations—a large company assembled to do honour to M. PYNÆRT. The occasion was the twenty-sixth anniversary

of his entry into his professional work connected with the State School of Horticulture. Professor KICKX, the Rector of the University, presided—COUNT DE KERCHOYE, the President of the Society of Agriculture, under whose auspices the Quinquennials are held, the Director of the Ministry of Agriculture, and of course a large number of representatives of societies and of colleagues and friends, were present; while Madame PYNÆRT and the ladies of her family were concealed amid the Ferns and Palms behind the bust of "our" king. It is not for us to criticise the arrangement, but we may at least express an opinion that the *fiête* would have been rendered even more complete had Madame PYNÆRT not been hidden away behind the shrubs. Surely she had the right to share her husband's triumph, and receive the congratulations of their friends. We cannot enter into details as to this celebration. They fill six columns of the *Ghent Journal*. They were moulded on the same lines as those which were followed in the similar celebration in honour of Professor RODIGAS, and noted by us at the time.

We were not able to take time by the forelock, and announce the successful occurrence of this celebration some weeks beforehand, as one of our American contemporaries, gifted, as it seems, with foresight, did. But, in truth, it is easy to imagine the course of events, and the enthusiasm of the guests. What we in this country cannot realise is the State recognition of M. PYNÆRT'S services. The Rector of the University, in proposing the "usual loyal and patriotic toasts," took occasion to say that the King was desirous of associating himself with the "Manifestation," and of giving it official sanction. Professor KICKX was, therefore, charged in the King's name to present to M. PYNÆRT the Civil Medal of the First Class, not only as a recompense for his great services, but also as a precious encouragement for the future.

Following the Presidential introduction, M. BURVENICH gave at great length a detailed account of the career of the hero of the day, from his school-days, his training under VAN HOUTTE, his work as a journeyman in Munich, in Paris, at Belœil, as Head Gardener to the Prince DE LIGNE, and subsequently as Professor in the Ghent School of Horticulture. M. BURVENICH alluded to his colleague's literary work, his books, his valuable editorial work in connection with the Horticultural Press. Then came a deputation of pupils from the School of Horticulture to offer their tribute, and more, and yet more colleagues rose to "demander la parole," till M. PYNÆRT himself, anxious not to omit the names of any individual or society which had done him homage on this occasion, was compelled to have recourse to a written document, and to make his tongue render, at second-hand, what his pen had written. For so accomplished a speaker this would seem to have been a mistake, but when a man is overwhelmed with testimonials such as were showered upon M. PYNÆRT, the readiest speaker might find himself at fault. All four of the leaflets of the "four-leaved Shamrock," that flourishes so well at Ghent, have now been honoured in this way, each after twenty-five years of service. They have worked together so well that veritably one must multiply by four to estimate the result of their services to Belgian horticulture, and, through it, to that of the world.

— THE JARDIN DES PLANTES.—We have received from the Director, Professor MAXIME CORNU, a list of stove and greenhouse plants which may be had by way of exchange on application to the Director, 27, Rue Cuvier, Paris.

— OLYMPIA, KENSINGTON.—Mr. HERBERT GLADSTONE has contributed an article on the all-

important subject of "National Physical Education," to the book which is to be published in December next, in connection with the opening of "Olympia," the new National Agricultural Hall at Kensington.

— FOOD REFORM.—Our fruit growing friends may like to know that the Vegetarian Society has arranged for a special *table d'hôte* dinner and fruit conference to be held on November 5, at 303, Strand, the Queen Victoria Restaurant. Select exhibits of dessert Apples and Pears will be shown, suited to provide a supply for the winter season.

— HIGHGATE, FINCHLEY, AND HORNSLEY CHRYSANTHEMUM SOCIETY.—We are informed by Mr. H. BARNABY, 49, Southwood Lane, Highgate, N., the Hon Sec. of the Society, that the autumn flower show and second exhibition of Chrysanthemums, fruit and vegetables, &c., will be held in Northfield Hall, Highgate, on November 3 and 4. A large number of classes are provided, and the money offered in prizes is about £100.

— POTTERY AT LIVERPOOL INTERNATIONAL EXHIBITION.—We notice that the Executive Council of the Liverpool International Exhibition have awarded to Mr. JOHN MATTHEWS, Weston-super-Mare, a Silver Medal for terra cotta vases, &c. The exhibit attracted much attention at Liverpool, and was universally admired.

— THE LIVERPOOL SHIPPERIES EXHIBITION.—Mr. JOSEPH WITHERSPOON, Red Rose Vineries, Chester-le-Street, received a Silver Medal for his horizontal tubular hot-water boiler, "Red Rose," and was also awarded the Bronze Medal of the Royal Horticultural Society's Provincial Show at Liverpool in July last.

— "DER PRAKTISCHE GARTENFREUND."—This is the title of a new horticultural journal to be published weekly in Berlin at 4s. a year. Its contents are varied and practical, and print and paper are good—better than in our penny gardening journals.

— "LINDENIA."—The last number contains coloured figures of—

Catasetum Burgerothi, t. 57.—An extraordinary white-flowered species, described from a sketch only. The flowers are in racemes, each flower being about $\frac{3}{4}$ –4 inches across. We shall await with eagerness the flowering of this remarkable plant.

Odontoglossum luteo-purpureum, t. 58.—A grand species, discovered by LINDEN in the woods of Quidind, New Granada, and characterised by racemes of large five-rayed flowers, the segments ovate-anceolate, heavily blotched with chocolate-brown, and with an oblong rounded white lip with a central brown blotch. It is one of the finest cool Orchids.

Pilumnus nobilis, t. 59.—A lovely species with smooth elongate oval pseudobulbs, oblong retuse leaves, and racemes of large white flowers, proceeding from the base of the pseudobulbs. Each flower measures $\frac{1}{2}$ inches in longest diameter, the segments linear lanceolate, the lip stalked, broadly obovate, pure white, with a yellow blotch in the throat. The plant was originally discovered in Venezuela by LINDEN.

Vanda swavis Lindeni, t. 60.—A fine variety of a lovely Orchid with white flowers spotted with reddish-violet and deep violet coloured lip. The raceme of flowers is pendulous, and the petals bent backward, while in *V. tricolor* the raceme is erect and the petals in the same plane as the sepals.

— THE "ORCHID ALBUM."—In the last number the plants figured are—

Cattleya Trianae Dodsoni, t. 249.—A very beautiful variety, sold by auction for 15s guineas at the same time that C. T. Osmani was bought for 215 guineas by Mr. B. S. WILLIAMS. C. T. var. *Dodsoni* has flowers 8–9 inches across, with pure white sepals and petals, the lip deep violet-crimson, slightly margined with pale pink, the throat orange-yellow. It blossoms in winter.

Sobralia vantholewa, t. 249.—A magnificent flower, 6 inches across in widest diameter, with broadly ovate-lanceolate segments, and a lip with a convolute base and flat crumpled disc, all the parts being of a primrose colour, with the exception of a blotch of orange and a few similarly coloured streaks in the throat of the lip. For a fine photograph of this

species we are indebted to Mr. POWELL, in whose collection at Drinkstone Park, Bury, it flowered lately.

Odontoglossum Cervantesi decorum, t. 251.—The flowers of this species are borne in long clusters; each measures about 3 inches across, with broadly ovate acute segments, white, with concentric rows of small linear reddish-violet streaks, and with an ovate lip crisped at the edge, white, marked with red stripes. A cool Orchid. Native of Mexico.

Dendrobium Williamstanum, t. 252.—A New Guinea species, with terminal many-flowered racemes, each flower about 2½ inches across, sepals oblong-acute, petals broadly ovate, both white; lip ovate acute, concave, deep rich violet coloured.

— LONCHOCARPUS BARTERI.—Travellers tell us in glowing terms of the magnificence of the tropical

comprises a variety of beautiful and interesting plants hardly to be obtained, if at all, in the ordinary way of trade. At the same time, we sympathise with the Director in his feeling that it is not the proper work of a botanic garden, to enter into the arena of trade and compete with legitimate traders.

— A POTATO CONFERENCE.—We observe from an unsigned circular which is being distributed that it is proposed to hold a Conference on the Potato, together with an exhibition of varieties of the tuber. The exhibition will consist of four sections:—1. A historic and scientific collection, to include early works on botany in which the Potato is figured; maps showing the European knowledge of the New World 300 years ago, and the proximity of Potato-growing districts to the ports most frequented; early

up with a headache and a jumble; but go out into the fields and hedges and collect examples of leaves, flowers, fruit, &c., and learn the names of all their forms and varieties with the aid of your book, and you will find the process healthful and delightful. So far from terms being a weary burden on your mind, if you learn them in this way and learn them thoroughly, they will be as household words. In studying the elementary structure of plants do the same with your microscope. Get examples, as far as possible, of every form of cell and tissue, make sections of various stems and roots, and familiarise yourselves by actual experiment with all the details of this branch of the subject."

— WHORTLEBERRY WINE.—The British Consul General at Frankfort-on-Maine, reporting on the trade

FIG. 112.—TREE FERNS AT TRESCO ABBEY, SCILLY. (SEE P. 558.)

climbing plants, but as often as not they have to cut the tree down to get at the rich flower-clusters. At Kew they manage things differently; the creepers find their way to the top of the Palm-stove, and the visitors find their way after them by means of a spiral stair, and so manage to realise a little of the splendour described by travellers. The sight of the foliage of the huge Palms thus looked down upon is one of the most impressive sights that can be imagined for those who appreciate plants; but just now there is another attraction in the shape of this climber, which is producing its loose clusters of pale violet Pear-shaped flowers with freedom.

— CAPE BULBS.—We have received from the Cape Town Botanic Garden a list of bulbs cultivated for export. These bulbs should be ordered now, and will be delivered from January till March. Messrs. SILBERRAD & SONS, 25, Savage Gardens, Crutched Friars, London, act as forwarding agents. The list

books on travel and voyages in which references to the Potato occur; works and papers in which attempts to define the different species are made; illustrations of the species and varieties; contemporary references to the voyages of HAWKINS, DRAKE, GRENVILLE, and RALPH. 2. Illustrations of Potato disease, and works on the subject. 3. Methods for storing and preserving Potatoes, and for using diseased Potatoes, &c. 4. A display of tubers of the various varieties grown.

— BOTANY.—In an address to students of pharmacy Mr. MARTIN gave the following excellent advice, which is as applicable in its way to young gardeners as to pharmaceutical students:—"In this subject make your reading as much as possible subservient to practical work; that is to say, the study of actual specimens, whether in the field or by the aid of the microscope. Sit down and read and try to remember all the definitions and terms, and you rise

of that town, says:—"Among the different unfermented wines, Whortleberry wine has been produced largely of late for export. A house in Frankfort has made efforts in this direction for years, and by the co-operation of some medical authorities, has at last succeeded in preparing a wine from the berry."

— AMOUNT OF QUININE IN CINCHONA TREES.—The late Mr. HOWARD found that the amount of quinine varied largely in trees of the same species growing in the same locality. High-class barks should alone be cultivated.

— "RUMPUFUS" HAT.—In a report on the trade of Niagpo for 1885 it is stated that the Rush hats which were so popular in this country a few years since are again coming into prominence, after having abruptly dropped in 1882 to a very low figure. The demand for these hats in foreign markets had been brisk, and there was a prospect of the trade

increasing still more. As the raw material can be grown in poor soil, and does not require much attention on the part of the grower, the only limit to the expansion of the trade being the needs of the market.

— **HOPS IN INDIA.**—An attempt has been made to grow the Hop on the Nilgherries, and a beginning has been made by raising a stock of plants from cuttings supplied by the manager of the Nilgherries Brewery to Mr. LAWSON, who, however, fears that the climate of these hills is not likely to suit the plant. The Government is very much interested in this experiment, which, if successful, will prove of great advantage to the ryots of the Nilgherrie hills, for breweries have now been opened there, which import their Hops from England at a heavy cost. If, therefore, the plant can be successfully grown, it will open up a new source of income to the people, who are sure to take to its extensive cultivation when they learn that the produce of their fields will be bought up by the owners of the breweries.

— **INTERNATIONAL EXHIBITION, LIVERPOOL.**—Messrs. F. A. DICKSON & SONS, the Queen's Seedsmen, Chester, have been awarded by the jurors the committee's Gold Medal for their excellent exhibit of trees and shrubs. The collection is of such a character as well to merit the distinction thus conferred. The specimens of the choicer Conifers, and of some of the more effective evergreens and deciduous plants which were used with such good effect in the general arrangement and in the special decorative designs were perfect of their kind, shapely plants, of fine colour and well grown; the Conifers were such as could rarely be surpassed.

— **AUTUMN LEAVES FOR BOUQUETS.**—That these admit of considerable use in bouquets, garlands, sprays, &c., an inspection of Mr. Maurice Young's flower-stall, near "Old London," at the Colonial Exhibition, will amply prove. Various varieties of the Maple (conspicuous being *Acer saccharinum*), Virginian Creepers of sorts, *Rhus Cotinus*, and other Sumachs, the foliage of the Tulip tree, Champion and other deciduous Oaks, are amongst the most familiar examples.

— **THE MIDDLE TEMPLE.**—The Chrysanthemums in the garden of this part of the Temple are no longer one of the pleasant autumn sights of the town, and we miss the little narrow house that held them, nestling somewhat inconspicuously under the walls of the Temple dining room. For some inscrutable reason their cultivation remains in abeyance, whilst those of the Inner Temple, under the management of Mr. NEWTON, remain to refresh the eyes of the Londoners with their gorgeous colours and quaint forms. Every one would hail with satisfaction Mr. WRIGHT's reappearance in the friendly rivalry.

— **SPOCEL SEEDS.**—A correspondent sends us a sample of a small seed the size of and something of the shape of Linseed, but with a greyish colour and a well marked longitudinal scar or hilum, by which the seed was attached to the placenta: this suggested either Primulaceæ or Plantaginaceæ as the source of the seed, and then came to the remembrance that *Ispaghul* seeds are used in India to make a mucilaginous drink. These seeds it appears are now imported largely from Bombay to Liverpool, but for what purpose is not known. *Ispaghul* seeds are the produce of *Plantago* *Ispaghul*.

— **BRADFORD SCHOOL OF SCIENCE AND ART.**—Bradford is not going to be behind Manchester, the programme of whose exhibition we mentioned last week. The labours and philanthropy of Sir TITUS SALT are widely known. To more effectually commemorate them the "Salt" schools originally given by Sir TITUS SALT to the town, and wherein science and art as applied to manufactures are taught, are to be rebuilt on a larger scale, as a memorial to the late Baronet. The schools are very complete, with libraries, laboratories, studios, workshops, and all necessary appliances. The opening of the new school is to be celebrated by an exhibition of manufactures and works of art. Class 10 includes vegetable substances used in manufactures, while horticultural and agricultural implements find place in class 17 of the programme. Eight acres of garden are to be provided, the furnishing of which will be done by Messrs. FISHER, of Sheffield.

— **NATIONAL CHRYSANTHEMUM SOCIETY.**—A meeting of the above Society took place at the Royal Aquarium on Wednesday last, when a goodly number of subjects were staged, and several new flowers obtained certificates, the names of which and further particulars as to the meeting will be published in our columns next week.

— **THE EMBANKMENT TREES.**—We note with satisfaction that the tree pruner, with his knife and saw, has ceased from troubling; and if he should continue in the same favourable turn of mind these unlucky trees, which by years of maiming and amputation resemble those turned out by the industrious toy makers of Thuringia, may in a few more years assume their naturally handsome form. At present they are growing well, and in a few seasons will give ample shade to pedestrians on the hot dusty Embankment. But prudent thinning must not be much longer delayed.

— **FLORAL DEVICES.**—Our American cousins are usually considered a go-ahead people, but in the matter of floral devices they seem to be where we were fifty years ago or more. One of the latest novelties is a bell made of flowers, with handle and clapper complete. This is the sort of thing our May Day sweeps are now abandoning. Beauty of appropriateness is, after all, about the highest form of beauty.

— **HAIRY OR GLABROUS.**—In some plants and under some circumstances the presence of or the absence of hairs on the leaves furnishes a ready means of discrimination between one plant and another. That this is not always the case is shown in the instance of the little known but beautiful *Grycia Sutherlandii*, which has some of its leaves covered with hairs, others destitute of such investment. We owe to the kindness of the authorities at Kew the communication of leaves, showing both states, and of one shoot on which some of the leaves are hairy, others quite glabrous. In an old plant in the Chelsea Botanic Garden this condition was observed many years ago, but we are quite unable to supply a satisfactory reason for it.

— **BRITISH WINES.**—Our forefathers made wine in this country—why should not we? The answer, we suppose, is that it is hardly worth while, now that we can get better wine from abroad at equal cost. It was different in the old times of the French wars, when trade was anything but free, and ecclesiastics brought with them Vine-dressers, and added the sugar our relatively useless climate denies. Then vineyards flourished in Kent and elsewhere, as they might do now. The British wine makers now have to contend in competition with their fellows in the colonies of Australia, the Cape of Good Hope, Cyprus, &c. Undeterred by this, the veteran Mr. FENN, who has devoted a long lifetime to the amelioration of the Potato, and a shorter one to the fabrication of British wine, exhibited a number of samples on Tuesday last at the Royal Horticultural Society. It was a bold thing to do, and some who were on the tasting committee evidently were not inclined to award a First-class Certificate. For our own part, after having tasted during the summer various productions from our colonies, we feel bound to admit that Mr. FENN's productions were considerably better than the worst of the Australian or Cape wines, and we are disposed to think that if more care had been exercised in bringing the wines under the notice of the committee, less prejudice would have been felt.

— **PUBLICATION RECEIVED.**—*Report of the Agricultural Resources of Mauritius.* By JOHN HORNE, F.L.S., Director of Forests and Gardens. (Government Office.)

— **GARDENING APPOINTMENTS.**—Mr. H. REYNOLDS, late Plant Foreman at Upper Grove House Gardens, Southampton, has been appointed Head Gardener to R. KERHAWK, Esq., Crownest Park, Halifax, Yorkshire.—Mr. W. WILLIAMS has been appointed to succeed Mr. WRIGHT (under whom he has been Foreman four years) as Gardener to W. H. GREENFELL, Esq., Taplow Court, Maidenhead, Berks.—Mr. J. SANDERS, late Foreman of Broadlands, Romsey, Hants, has been appointed Head Gardener to H. S. STANLEY, Esq., Paultons, Romsey, Hants.

Notices of Books.

Lectures on the Physiology of Plants. By S. H. VINES, M.A., D.Sc., &c. (Cambridge: University Press.)

This is a book which has been awaited with eager expectation. In spite of the fact that in this country we can boast of Grew, of Hales, of Priestley, of Knight, of Robert Brown, all foremost names in the history of the vegetable physiology of the past, all men who have laid, and laid truly, the foundations of the science—in spite of these exemplars the study of vegetable physiology in this country has fallen into comparative neglect. Nowhere has this unfortunate state of things been more frequently pointed out and deplored than in these columns—a fact we may the more readily mention, now that the pendulum is swaying so markedly in the direction of physiology and physiological anatomy to the detriment of morphology and classification. Till lately we have been indebted for our knowledge of modern vegetable physiology almost exclusively to German sources. A prevalent defect in German publications is, however, observable in their method. Accurate in research and labourious in detail, German authors are often deficient in system, and fail to arrange their material in orderly, coherent sequence. Respect for the law of priority, and regard for the nomenclature of their predecessors are too often conspicuous by their absence. The result is seen in an influx of terms whose novelty lies rather in themselves than in the phenomena or in the facts they are supposed to denote, while in other cases they are calculated to mislead by giving the impression of knowledge where little or none exists.

A good English treatise, thoroughly abreast of the advanced science of the day, has long been a desideratum, and hence the impatience with which Dr. VINES' book has been awaited. Nearly ten years have been expended in its preparation. Ill health and official duties have, however, much interfered with the progress of the book. The title aptly describes its nature. It cannot be looked on as a complete treatise on the physiology of plants. It is simply an expansion of the author's lectures on the subject, and its merits and demerits must be judged by this standard.

Starting with the structure and properties of the cell-wall and those of its contents the author treats in succession of the absorption of water and gases, of the movements of water in plants, of transpiration, nutrition, including the changes which food substances undergo in the plant by "metabolism." Then follow chapters on growth, sensation or irritability, and, lastly, reproduction.

The chapters which in consulting this volume have left the most favourable impression upon us are those on metabolism. The general facts and phenomena relating to the nature of plant food and of the means whereby it enters into the plant are fairly well known and fairly well explained in the text-books, but the changes which those substances undergo in the plant itself under the influence of light and other conditions are far less well known. The chemist tells us what is the nature of the food, the physicist tells us how it enters the plant; again, the chemist tells us the result of the final cremation in his laboratory, but the intermediate processes which are all-important to the life of the plant, and which in consequence are the very thing the cultivator wants specially to know, are not nearly so well known nor so well treated of. It is in this department we expected most from Dr. VINES—let us hasten to say that our expectation has been fulfilled, and we may point to pp. 158—160, 325—330 as containing in small compass an admirable summary of existing knowledge discussed in fuller detail in preceding pages. In other sections the book is more a record of what so-and-so (the said so-and-so being usually a German) has done, or what he thinks, than a regular connected history of the life-processes. This, under the circumstances, is more or less unavoidable, but we should have preferred Dr. VINES to have subjected his stores to some process of metabolism, and to have relegated the record of the sources whence he derived his information to the ends of the chapters. In these situations, indeed, there is generally given a list of books and memoirs, which of itself would be sufficient as a record of authorities, or as an indication to the student of the books where he might find fuller

information. With reference to these bibliographical references, we may mention a matter, small in itself, but one the omission of which is calculated to occasion the student some unnecessary loss of time—we allude to the omission of any citation of pages. Thus we find a reference, "Payer; *Comptes Rendus*, xviii., 1844," and throughout it seems to be the exception to quote a page. In the chapters on Irritability we find a flood of neologisms, for which, however, the author is not personally responsible. Nothing can be said about these when necessity or convenience demand their usage; the objections creep in when such terms are taken as explanatory, as they are very likely to be by careless students; thus the now familiar "geotropism," "heliotropism," we know from experience, are often used by students as explanations rather than mere descriptions of observed phenomena. "Negative geotropism" is worse still, and suggestive of the adage, *ex nihilo nihil fit*. The real explanation is the disproportionate growth of one portion of the plant as compared with another—a disproportion brought about by various agencies, light, heat, moisture, &c. Some of these new terms remind us forcibly of M. Jourdain's discovery that he had been unconsciously making use of those all his life; for instance, every one, we imagine, who has seen weeds growing in a flowing stream must be familiar with their appearance; but now we are told that organs grown under the condition of "heliotropism" place themselves so that their long axes lie in the direction of the current—a sufficiently obvious fact, explained as follows—"The force of a current of water exercises a directive influence, in fact it induces 'heterauxesis'" (disproportionate growth), and so gives rise to curvatures of plant organs." We very greatly fear that some of these terms will convey to students in other departments of science the impression that botanists know much more about these phenomena than they really do, and when they are undeceived, their opinion of the botanists will not be enhanced.

The chapter on reproduction, containing a summary of the comparative morphology of the reproductive organs of plants, and of their action, is one of the best features of the book, but even here clearness is rather diminished than promoted by the terms introduced to indicate variations in the time or stage of growth at which the formation of spores, true buds, or eggs respectively takes place, or does not take place as the case may be.

Grafting, hybridisation, and bud-variation—matters of great importance to cultivators—are here passed over very briefly, but of this we have no right to complain, as the book does not profess to be a complete treatise. For a similar reason, that the book does not profess to be a history, we need not demur to the omission of reference to the work of Griffith, Thwaites, Berkeley, Daubeny, Henslow, Bennett, Dickson, Dyer, MacNab, and other English workers in vegetable physiology, though the omission might lead to the inference that less has been done in this country than is actually the case. The work is fitly concluded with a copious and well arranged index, and we may, in conclusion, thank Dr. Vines for having supplied a pressing want, and for having done so in such a manner, as, in a large measure, to remove the stigma under which English vegetable physiology has for the last twenty or thirty years been labouring—that of having no high-class text-book specially treating of vegetable physiology.

THE BULB GARDEN.

THE WHITE TRUMPET DAFFODILS.

MR. HARTLAND'S letter at p. 535 tempts me to make a suggestion in the *Gardeners' Chronicle* on this group. I made the suggestion in a contemporary, that the vexed question of the nomenclature should be settled in the gardens of the Royal Horticultural Society at Chiswick. After writing the note referred to, I happened to call upon Mr. Peter Barr, at 12, King Street, Covent Garden; he then and there told me that this was the best way to settle all disputed questions, and he was even now ready to send a collection of the "White Trumpets" to Chiswick, if others who have written and talked a good deal about them would do the same. It also appears to have been decided at one of the meetings of the Narcissus Committee, that all growers of this type should be invited to send bulbs to Chiswick for comparison. Further the Hon. Secretary to the committee had, it

is stated, made an effort to get growers to send bulbs there. It is perhaps too late to ask amateurs to take up their bulbs now from the open ground, but arrangements could be made to do so next year, as has also been suggested by others. Mr. D. E. Wemyss, of Torrie House, Dunfermline, grows a large collection of this type, and offers to send to Chiswick next year. Mr. Barr will also send a very complete collection. Will Mr. Hartland and others also do so? *J. Douglas*.

NARCISSUS ELEGANS VAR.

A pretty little *Daffodil* of unusual interest is now flowering in the Royal Gardens at Kew. Its affinity is undoubtedly that of *N. elegans*, but it answers to none of the varieties of that species described by Herbert in his *Amaryllidaceae*, and it is not mentioned by Mr. Burbidge in the *Narcissus, its History and Culture*. So far as the cup or corona goes—which is a very rudimentary one—it comes nearest to *N. obsoletus*, but in Herbert's figure the segments are represented as being nearly obovate, with a short abrupt point. In the variety in question, however, the segments are linear pointed, longer than *N. obsoletus*, and having the merest apology for a cup at their base, hardly discernible at all until the segments have relaxed, which they usually do when the flowers are beginning to fade. In all other respects it answers to *N. elegans*. It was introduced from Algiers. *B.*

THE ORANGE COCCUS PARASITE.

THE article published in the number of the *Gardeners' Chronicle* on July 17 last gives an account (p. 77) of the great extent to which the Orange is cultivated in San Francisco for commercial purposes, whilst the treatise on Orange insects, by Mr. W. H. Ashmead, of Jacksonville, Florida, U.S.A., shows that in the Southern States the cultivation of this fruit has very greatly increased of late years, as we also know is the case in various parts of Australia. In our article above referred to it is stated that "the Orange trees in San Francisco are suffering 'immense damage' from the 'white scale';" some of the oldest Orange orchards in the country are being topped and pruned to such an extent that they will not bear any fruit for several years. In some cases the trees are being cut down. No cheap effectual remedy has as yet been discovered to destroy the insect: it is stated, however, that another insect has appeared which preys on the white scale, and is not injurious to the Orange tree." This statement is not sufficiently precise to allow us to determine the latter insect, or the species of scale or Coccus which is so injurious to the Orange, as it is unfortunately happens that there are quite a number of species which are attached to that fruit tree.

In the report published by Messrs. Comstock, Riley, and Hubbard "on destroying Coccidæ on Oranges," published in 1881; in Mr. Fraser S. Crawford's Paper on the "Round Orange Scale in Australia," read before the South Australian Gardeners' Improvement Society, on May 6, 1882, published at the Surveyor-General's Office, Adelaide; and especially in Mr. Comstock's Report on Orange and Lemon "Scales" for 1883, about twenty species of Coccidæ are enumerated, which attack these fruit trees, and which are referred to the genera *Aspidiotus*, *Chionaspis*, *Parlatoria*, *Mytilaspis*, *Ceroplastes*, *Dactylopius*, *Icerya*, *Lecanium*, and *Chrysomphalus*. These numerous genera and species of Coccidæ are infested and destroyed by various minute hymenopterous insects belonging to the immense family Chalcididæ, and sub-families Aphelinæ (including the interesting little genus which, years ago, the writer hereof published under the name of *Cocophagus*), Encyrtinæ, as well as the still more minute insects of the genera *Anaphis* and *Myrmar* in the family Mymaridæ. These little creatures, notwithstanding their exceedingly small size, are fearful enemies of the Coccidæ, within whose bodies they find their abundant subsistence, leaving only the empty shell or scale.

We have been indebted to James W. Gooch, Esq., of Windsor, for specimens illustrating the history of a species of *Mytilaspis*, which is parasitic on the St. Michael's Oranges, often occurring on the outside of the fruit itself (as is the habit of some of the other species which infest both Lemons and Oranges).

The upper figure of our woodcut (fig. 113, p. 565) represents the female *Mytilaspis* (the species of which we are unable to determine for want of specimens not

embedded in Canada Balsam for microscopical examination), highly magnified, showing the very minute pair of antennæ (more strongly magnified in fig. 2) being slender and filiform, with a long terminal joint; the hind part of the body is dilated and oval, with the sides of the segments produced on each side into a small point, the extremity of the body rounded and finely serrated. The skin of the female Coccid is very thin, and allows the enclosed parasite to be distinctly visible, the head of the parasite being turned towards the posterior extremity of its prey. In the specimen sent by our correspondent, the parasite had assumed the pupa state, the wings being small and rudimentary, the pointed extremity of each being formed of the very elongated hairs with which the margins of the wings are furnished. Fig. 3a represents one of the rudimentary fore-wings, and *b* one of the smaller hind wings, and *c* one of the middle feet laid at rest on the underside of the body. Fig. 4 represents one of the parasites of the Coccus fully developed, the body is oval and flattened (injured? by insertion in the Canada Balsam slide) with the wings veless, except the basal portion of the front margin of the anterior pair: each of these fore-wings is fringed with about fifty very long and slender hairs. The antennæ (fig. 5) are inserted below the front upper margin of the head, and are composed of eight joints, of which the basal one is the longest, the second shorter and oval, the third, fourth, and fifth small and more slender, and the sixth, seventh, and eighth longer and thicker than the rest. This structure indicates the specimen sent to be a female. The legs are slender, with five-jointed tarsi (fig. 6), the middle legs not exhibiting the formation for leaping displayed in the middle legs of the Encyrtidæ. The natural size of this little creature is represented in the small crossed lines in the middle of fig. 7. The general colour of the insect is pale buff or fulvous, but its immersion in Canada Balsam has probably altered its natural colour. Until more complete materials occur for systematic identification we can only suggest the name of M. Micheli for this parasite of the Orange Coccus. *I. O. Westwood*.

HOME CORRESPONDENCE.

Spiranthes Romanzoviana.—In the *Gardeners' Chronicle* of Sept. 11 Mr. A. D. Webster quotes from a letter from Mr. Gumbleton, facts as to the ploughing up of a field in which grew *Spiranthes Romanzoviana*, and pathetically alludes to the probability of its proximate extinction. In succeeding issues M. Naudin comes to its rescue with advice for protection and preservation, apparently overlooking the fact that Mr. Gumbleton's correspondent had not been able to find it to preserve. Mr. Webster is again more hopeful, and cheerfully alludes to its probable re-appearance. Finally, Mr. Burbidge indorses these hopes, and announces his intention of equipping an expedition next season to stay the eviction, and, if necessary, to reinstate the evicted one, thereby showing that even an Englishman after a short residence in Ireland adopts the popular programme. It may interest him to hear that news comes from a reliable source that an expedition for a similar purpose is being planned not far from Hamburg, the great obstacle to which is the railway tariff, and an objection strongly characteristic of Irish "jarvias" to carry "fares" long distances at low rates during the tourist season. My object in troubling you is to send you the enclosed copy of a most interesting letter, in which the same doubts and fears are shown to have agitated the minds of lovers of British plants nearly half a century ago, and yet we find that *Spiranthes Romanzoviana* has been found during recent years in or about the same locality, thereby proving how "racy of the soil" its disposition must be, as, though paying no rent, and frequently evicted, each succeeding year it manages somehow to reinstate itself. Now that so much attention has been drawn to it we may reasonably hope that it will henceforward be left in undisturbed occupation. May it always be as successful in eluding collectors as in the case of Mr. Gumbleton's agent, *W. Moore*.

"Dear Sir,—I am extremely sorry I was not aware of your desire to get the 'rarity of rarities,' as Professor Lindley of the Horticultural Society, London, calls the *Neottia gemmipara*, earlier in the season, as I would have sent you a couple of specimens alive and growing in their soil. I happen to have a few badly preserved dried specimens, and I lose no time in sending it to you. There is yet one of these lovely plants in full bloom which I really do not wish to disturb, as they are now become extremely scarce in consequence of the field where I found them in plentifully, and which was their

principal habitat, has been dug up and actually buried, so as to make it fit to put Potatoes in. This has given me great disappointment, as I would have gladly paid more rent than the field was worth in order to afford me the gratification of giving these plants to those interested in the science. Professor Lindley, in his letter, calls it *Spiranthes gemiparva*. Will you kindly let me know if he is right? Mr. Babington, of Cambridge University, who visited me at your place last year. Next year (*D. P.*) I hope to be able to send you some excellent living specimens. Parson Gardon hurry.—Yours respectfully, *F. A. A. Castleton, August 30, 1844.*"

—Some time ago doubts were expressed as to whether or not the North American *Spiranthes Romanzoffiana* and the Irish plant of the same name were identical. For my own part, I am now fully convinced that they are one and the same, as a number of herbarium specimens shown to me by Professor Macoun, and collected by him on the Rocky Mountains, as well as drawings of the plant in flower, clear away much of the overhanging mist. To settle the question, however, in the most satisfactory manner, living specimens of the Orchid are to be sent from their native habitat, and will be planted alongside the Cook plants in my garden, so as to be detected, if any exist, will then be readily enough detected. The Professor informed me that this pretty Orchid is fairly abundant in many of the upland bogs and valleys, and that he has frequently met with it along the banks of mountain streams, not actually in the dampest soil, but always where an abundance of moisture is present. To any person interested in the plants of North America, Canada in particular, a look over the herbarium specimens just now exhibited in the Canada section of the Colonial Exhibition will repay the time expended; while an examination of the beautiful coloured drawings of Orchids hung close to the entrance to the Albert Hall is quite a treat to the lover of these quaintly curious flowers. The long-lost *Cypripedium* has again been discovered by Professor Macoun, and the illustration and colouring, which I was told was faithfully rendered by the artist, makes one wish that it was more plentiful. *A. D. Webster.*

Chrysanthemums at Harlesden Park.—If the splendid head of bloom now to be seen in Mr. E. Sanderson's house at Harlesden Park, Willesden, can be taken as a criterion of the state of things generally among those who grow for exhibition, then we may anticipate a very fine exhibition of blooms when the November contests come on. For a great number of years Mr. Sanderson, who is the President of the National Chrysanthemum Society, has held his own in the contests inaugurated by his own society, growing flowers famous for their superb quality though not quite so large in size as those of some other growers. This season, as he intends to compete in the class for 45 blooms in 24 varieties at the Royal Aquarium show next month, he has grown larger flowers, but they are remarkably fine, full, with broad petals and rich colours. But they are early enough, and whether the earlier blooms will keep until November 10 is a matter that will depend to a large extent upon the character of the weather. Damp is the enemy most to be guarded against, and Mr. Sanderson puts on a little fire-heat, at the same time giving free ventilation. Altogether there are about 175 plants in a house 20 by 12 feet, many of them in 16-ozed pots, a few in 24-size. They consist only of incurved varieties, about 48 being grown; no Japanese, pompon, or reflexed type finds a place here. The plants are mainly from cuttings struck by Mr. Sanderson; he takes these off as soon as the plants have done blooming, and roots them in a little heat. They are ready for a good start in early spring. Here may be seen a wonderful growth, all the plants of single stems looking like young saplings, and in such foliage—large, rich olive-colouring, always extending to high-class culture. What strikes the visitor in the plants generally is the massiveness and breadth of petal, and in this respect Mr. Sanderson is in the front rank of cultivators. Just now the plants are being treated to a mild stimulant, made of sheep's dung and soot diluted with water. Nothing seems to give greater pleasure to the President of the National Chrysanthemum Society than to show his flowers to any one interested in them; he readily imparts information, and in the course of conversation lets fall many hints—learned by observation and a ripe experience—that if treasured up cannot fail to be of service to any learner willing to sit at the feet of this horticultural Gamaliel. *R. D.*

Anemones from Seed sown 1st April last.—The flowers sent show how a garden can be lighted up by them in October. In sunshine or lamplight the blossoms will open out wide indoors, and although small now they will increase in size with the approach of spring, when they measure between 4 and 5 inches across. *St. Bridget.* [The blooms, where bright and free from blemish, would be an ornament to any garden at this time of year. By sowing the seed in shallow drills, partly filled with light, very sandy soil, the

seed being rubbed and mixed together with silver-sand before sowing, plants are readily raised with but little care. A warm site should be chosen. *Ed.*]

Grafted Grapes.—Herewith I send a bunch of Gros Maroc, the produce of a Vine under my care which I grafted upon Foster's Seedling as a stock. I think you will find there no lack of colour in the sample sent; and what is more (if my taste does not deceive me), the flavour, too, is beyond the average for the kind. The bunch sent has been ripe these two months, and has kept, I consider, in good condition. Another case of grafted Grapes came under my notice this summer whilst judging at a country show. In this instance it was Black Alicante grafted upon Black Hamburg; the flavour of the Alicante was in the opinion of my brother judge and myself, much improved thereby. *Vitis.*

After what you experienced a man as "T. L.," Oakley Court, Windsor, has said (p. 502), I hardly care to follow, but I think were to be to see my grafted black Grapes on white Grape stocks he would be satisfied. Having three years since a Muscat of Alexandria Vine which did not finish its fruit to my satisfaction, I decided to graft a Gros Colmar on it, and only last week Mr. Gilbert of Burghley had a doubt as to this graft being Gros Colmar or black. The stock was so good, and the crop heavy. So much for this first experiment in grafting. Now I have at least a dozen good grafted cases of Gros Colmar on Muscat, and shall put one on Golden Queen and on Foster's Seedling next year. Another success that I can register is by putting Gros Maroc on Buckland Sweetwater, and this has good results—very good indeed; the fruit now hanging is very fine, and the flavour is very much improved thereby, at the same time the growth is very robust. Alicante grafted on Buckland Sweetwater is good in colour, but the berries are small; it is not an overcrop, as one can carry only four small bunches. My experience now tells me that the Muscat of Alexandria stock for Gros Colmar is very suitable, and I have proved that such a good crop cannot be got from Gros Colmar, and I have thirty Vines on own roots, therefore I ought to know. The flavour also is better, although as these are grown in higher heat than are those on their own roots, this may, or rather will favour the flavour. I expect something superior to the grafted Golden Queen, as it grows so strong here. My best Gros Colmar are now on Muscat, and these are so fine that they are those I would put up for exhibition were I showing. Size of bunch is very much larger on Vines so grafted. Last year (1885) grafts are very strong. I only had an odd bunch on this time, and they are so very black that it would please me to see a house full of them as good. Can any of your readers tell me where a good crop of black Gros Colmar is to be seen? *Stephen Castle, West Lynn.*

Another New Grape.—A well-known firm of nurserymen has announced another new Grape; this time it is a white Gros Colmar, which is said to be a late variety. I am sure it would interest more gardeners than the present scribe to know something of its history. Has it ever been exhibited at any of our horticultural exhibitions? Has it ever been before any of our Horticultural Associations or Fruit or Floral Committees? If so, with what results? *J. C. G.*

Gynerium jubatum.—In reply to your correspondent, Mr. Noble's, question on p. 536 of your last issue, I beg to inform him that there is undoubtedly a most distinct and beautiful form of the Farnes-grass bearing the name of *Gynerium jubatum*, which I believe to be indigenous to Chimborazo, whence it was sent to Europe by the late botanical collector, E. Rezel, some dozen years ago. I received my plant of this variety about the year 1876 or 1877, from M. Ledmoine, of Nancy, and during the comparatively mild winters of '78 and '79 it escaped almost any injury from frost, and grew rapidly into a fine strong tuft, flowering in the course of the last summer, not less than three times—in June, August, and October. The form of the inflorescence is quite distinct from that of any of the other varieties of the family that are known to me, the florets falling evenly on all sides of the stem, and they are of a silky texture and light purple shade of colour. The severe winter of 1880-1881 almost killed my plant, reducing it to a single stem; it has, however, since recovered itself, and is now again a strong tuft. Its stems are unfortunately very tall and of weak texture, so that they are easily broken by high wind. Your correspondent's plant cannot be true to name. *W. E. Gumbleton.*

Scarlet and Crimson Lilies.—Why is it the extremely showy and beautiful species of Liliun, possessing scarlet and crimson flowers, are not more generally grown? In collections we meet with the dingy matagons and the brighter tigrinum, Thunder-giants, &c., but very rarely with the finely effective

showy scarlets. Probably one reason is to be found in the fact that the best and brightest scarlet-flowered species are early bloomers, and as they thus bloom before the Lily grounds in nurseries are worth showing, are generally unseed, and therefore do not command so ready a sale as do others, because they are not more generally known. The best of the scarlet and crimson Lilies have beside the merit of being perfectly hardy border plants, with one particular merit attached, that the several varieties commence blooming early and may be had in bloom, several varieties in succession, during the month of May, June, and July, to say the least. They comprise Liliun Philadelphia, pomponium verum, which flowers in the month of May; Liliun tenuifolium, the fine-leaved Siberian species; and a dwarf glittering scarlet, which flowers in the month of June; Liliun chalcidonicum, a tall variety, growing up to 4 feet, or double the height of the last, having smaller, beautifully reflexed flowers, which expand during the month of July. Planted four or five bulbs together, so as to form dense clumps when in bloom, it is difficult to imagine showier objects for addition to mixed herbaceous borders. Owing to the dwarf stature of L. tenuifolium, and its narrow leaves, it is important to plant it nearer to the front of any such border than either of the two others. I would add a word here in favour of the Tiger Lilies, or the two varieties named L. tigrinum flore-pleno and L. splendens, both of which succeed admirably in any ordinary outdoor border, and where a moderate amount of sunshine exists. *William Earley.*

Market Prices.—The subject started by Mr. Collins is one which has important horticultural associations, and its ramifications are so wide that in attempting to discuss it we may soon find ourselves miles away from the origin of the theme, whose range is practically boundless. But Mr. Collins discusses the matter from the unfortunate No. 1 standpoint. His idea of prosperity is found in the producers' interests, and he has no regard for those of the consumer. Still farther his range of vision on the matter of trade is bounded by his own particular vocation and the probable effects of restricted trade through the imposition of taxes on imported commodities. He thinks nothing of our vast manufacturing trade so largely dependent upon foreign orders; of our carrying trade, and especially of the mercantile marine, so largely dependent upon that; of our vast seaports whose interests depend upon foreign trade; or of millions of people who exist upon our foreign trade. All that—and its range is illimitable—is put aside altogether in the narrow and restricted thought which makes up a restrictionist's notions of national prosperity. Why when he talks about our expending vast sums abroad on the purchase of goods others can create or produce far cheaper than when we purchase them here, but is not in accordance with the first law of Nature, self-preservation, which demands that we shall purchase for the satisfying of our wants in the cheapest and best markets. If we can raise these things better, or even as good or as cheaply at home, then we should do so, and the spirit of enterprise found in the nation will cause it to be done. If it is not done we may take it for granted that it does not pay, and that it is better for us to purchase elsewhere. But then those from whom we purchase find themselves in exactly the same position, and if they do not require our garden produce at least they want our ores and manufactures. One pitiable picture of foreign workmen as fat and flourishing whilst our own are here at home in poverty and wretchedness, is exemplified all the world over, where people of other nations make the same complaint of the incursions of the English and Scotch especially. We employ foreign workmen, as our shipowners do Lascares, simply because we are too ignorant, through lack of proper education, are too ignorant, and these imported foreign workmen are not, or else, as too often to our humiliation is the case, our workmen are too drunken and lazy. If our workmen were as technically well educated and trained, and as steady and reliable as the foreigners, we could dispense with the services of the latter. The metaphor employed, that we as a nation are a great trading firm, is a very good one so far as it goes, but, as regarding our firm, we are to trade with only not with ourselves, that is absurd, as no firm can exist by trading with itself. We must have customers, and we must reciprocally purchase of our customers of their commodities, if we are to create a prosperous and increasing trade. The more we can raise at home on our own national estate the more we shall have to exchange for the productions of other nations or firms. We sell at a profit, they sell to us at a profit, and, odd as it may seem, yet both nations or firms are mutually enriched. Plainly, then, in the shape of import duties in the way of this trading, and that trade, so profitable and so prosperous, mutually, will soon become ruined, with the production of misery to myriads. Theories of taxation and trade as existing in the limited imagination of the fair traders are pretty, but impracticable. Still farther,

every one would find, if attempted to be put into practice, that they would break down in every direction. A. D.

Fruit Trees upon Cultivated Ground, &c.—During the season now drawing to a close I have seen in several instances how very much better Apple and Pear trees have cropped upon cultivated ground than have others grown on grasslands, or in what are more properly known as orchards. Beyond this I have particularly noted trees, even when grown in orchards, especially Apples, have produced crops in keeping with their particular healthfulness even where many trees of the same sort grew together. Whatever, therefore, may have been the actual cause of Apple blossom falling so generally as it did this year tends to avert or to neutralise the cause in great degree. Certain distinct sorts certainly showed these peculiarities more than others. As an illustration, five finely headed thirty young trees, about fifteen years old, of Dumelow's Seedling grow in the orchard here. One of these trees, situated, it is surmised, in somewhat deeper soil than the others, is by comparison very green and vigorous of leaf. This tree gave a couple of bushels of fine Apples, whereas neither of the other four produced half a peck of fruit. Again, a sixth tree of the same sort, the smallest of

applied. There are other means to fertility, easily applied, but seldom thought of—artificial manures, and, failing other materials, I would advise all to give their trees some such assistance about the month of April, if but in the form of sprinklings over the turf during showery weather. Depend upon it, all aids are amply repaid by more and finer fruits. *William Earley, Ilford.*

Reports of Societies.

ROYAL HORTICULTURAL.

CANADIAN FRUIT.

A special meeting of the Fruit Committee of the Royal Horticultural Society was held at South Kensington on Wednesday, October 20, to examine the fresh consignment of Canadian fruits arranged in the conservatory. Mr. T. Rivers presided, and there were present Messrs. J. Lee, S. Iliber, J. Woodbridge, R. D. Blackmore, P. Crowley, J. Willard, Norman, Warren, A. Dean, and A. F. Barron, Secretary; some of the members of the Fear Congress Committee being included.

inferior to ours in flavour some of a more russetty nature were excellent. King of the Pippins, from Nova Scotia, was good in form and quality—about like our best samples. Gravenstein, from two localities, very fine richly marked samples, were rather diverse in flavour, but both soft and excellent. St. Lawrence, richly striped; and Fameuse, deeply coloured, like the Quarrenden, were fairly good.

The committee then inspected the whole of the fruits staged, of which there were over 2000 dishes, covering two broad tables the entire length of the conservatory, and finally passed a hearty Vote of Thanks to the Commissioners of the Dominion of Canada and the various exhibitors for the splendid show of fruits made, and whilst expressing warm admiration for the fine form and rich colouring found in the fruits reserved judgment upon the special merits of kinds, especially as many had been gathered before they were mature so as to enable them to be exhibited here prior to the close of the Colonial Exhibition.

The following collections of fruits constituted this remarkable and interesting display:—The Montreal Horticultural Society had a large collection, mostly of Apples. The West Riding Agricultural Society of Ontario, Apples, Pears, and numerous lots of Grapes of outdoor growth. The finest collection of these latter fruits came from Quebec, comprising some 150 dishes of white and black kinds, many foxy—a general characteristic of Canadian coloured kinds, some black as Sloes, while the white Grapes were richly green. It would be impossible to give a *résumé* of the kinds shown, but tasting showed that none materially excelled in flavour or sweetness our own best outdoor Grapes. This collection also included Apricots, many Pears, and about 300 dishes of Apples.

From British Columbia, on the Pacific side of the Dominion, came some 200 dishes, showing great size, in fact the largest average size in the show.

A very large and exceedingly interesting collection of well grown Pears and Apples came from the Bay of Quinte Agricultural Society. Mr. Dempsey was a large exhibitor here, and afforded the committee much useful information respecting the growth of fruits in the Dominion. All trees are of standard form, planted thinly; in some cases the soil beneath is cultivated, in others it is pasture. Clay soils give size, but the richest colour is found on uplands well open to the sun and where naturally well drained.

A fine lot of some 500 dishes of Apples came from Nova Scotia, and some 150 dishes from New Brunswick. These two latter districts seemed to give the warmest colour. Of kinds in fine colour were Empire Alexander, intensely rich, and very fine; Wealthy, medium-sized, exceedingly handsome, and red as Beetroot; Duchess of Edinburgh, superbly striped, and beautiful; Watercore, like Hoary Morning; Black Detroit, intensely coloured; Adams' Pearmain, very richly marked; Kenish Filbasket, very fine; King of Tomkins County, Cayuga Red Streak, Wellington, Maiden's Blush, and others too numerous to mention, but all very beautiful. Good samples of Vex of Winkfield, Beau d'Clairgeau, White Doyenne, Duchesse d'Angoulême, and other Pears, were shown, but these, as a rule, were put in the shade by the rich colour of the Apples. From the Dominion came also a very interesting collection of farm roots, with huge Pumpkins, corn cobs ripe and green, and in considerable variety; Potatoes of the true American type, large, long, and coarse in appearance; Yellow Danvers, and Red Wethersfield Onions, fair samples; Capsicums among which were huge red ones, as big as Nantes Carrots; gigantic black Aubergines, really good handsome red Tomatos, Livingston's Favourite, grown literally anyhow on the ground without stopping or training, and selling in Canada at 1s. 6d. per bushel, sample equal to our handsomest; Carrots, Parsnips, and other kinds.

THE POTATO, VEGETABLE, AND CHRYSANTHEMUM SHOW.

October 26 and 27.—At the closing important exhibition of the season the Society must be congratulated on having brought together, to delight the eyes of the many visitors to the Colindries, one of the best shows of the kind seen at Kensington. If we may generalise from the fine examples of kitchen garden produce put up on this occasion, we should say that vegetable growing is now much better understood by the rank and file of the craft than it has hitherto been. The lessons taught all classes by the public exhibitions in London and the counties is bearing fruit, and gardeners and amateurs alike set about their work with some more certain knowledge, based on scientific research, than was formerly considered to be necessary. We cannot credit farmyard manure, as being the only agent that has aided the soil in perfecting such fine Leeks, Celery, Carrots, Onions, Potatos, &c., for we know that the various forms of artificially made manures have become the constant aid, easily applicable and

FIG. 113.—ORANGE COCCUS. (FOR REFERENCES SEE TEXT, P. 563.)

all, which I found when I took the orchard had been terribly injured by American blight, grows within a vegetable ground enclosure. This tree had to be propped up owing to the quantity of fruit it contained. In like manner Hawthornedens of various sizes and ages produced crops good, bad, or indifferent, in perfect accordance with the health of the current year's foliage and vigour of the trees; and the same may be said concerning Blenheim Orange, Emperor Alexander, &c. Bearing this in mind, and judging by the experience of the past, I cannot but believe that the capacity for bearing invariably is with the trees on the best cultivated land. Is it to be wondered at, therefore, that dwarf cordon bushes, standards, &c., generally produce more regular and better crops than do those of orchard trees? If we push this consideration to its legitimate limits, and ask how Currants, Gooseberries, Raspberries, &c., would succeed grown in grass sward with only the natural unimproved subsoil for the roots to roam in, we arrive at the conclusion that fruit trees already existing in grass orchards are not favourably placed for fruiting well. To improve trees in such places manurings and mulchings should be liberal, however, and extend rather beyond the limits of the roots, judging these by the spread of the crown. These dressings will be of benefit at whatever season applied, though preference should be given to the month of February. Ashes of any kind, particularly wood ashes, are beneficial to all fruit trees, and, considering how abundant they are, it is a matter of wonder they are not often

Some seedling Apples, Pears, and Grapes were submitted to the committee, but no Certificates were awarded, the exhibits being dealt with simply by marks. The full number was given to a very handsome Apple of fair medium size, resembling very fine Nanny Apples, from Mr. Dempsey, of Ontario; its colour was rich, and flesh so excellent as to merit the highest award. It is named Treuton Seedling. A similar award was made to Mr. Fitzgerald, of London, Ontario, for a very handsome seedling kind, of beautiful rich colour, and having soft brisk flavoured flesh. Mr. Hendrew, Ontario, showed a variety much like Wellington, somewhat speckled, but it received only two marks; and the same award was made to Mr. W. Scott, Lambeth, Ontario, for a striped Apple, much like Duchess of Oldenburg, but lacking in quality; it is an exceedingly showy kind. A complete award was made to Mr. Dempsey for his Dempsey Seedling, from Williams' Bon Chrétien x Duchesse d'Angoulême—a fine Duchesse-like fruit, but rather larger, and having a briskest flavour. Canadian fruits of the Duchesse were tasted for comparison, to the credit of Mr. Dempsey's excellent seedling. A couple of white seedling Grapes were shown to the committee, the best, like Royal Muscadine, was named Emerald, and was considered superior in flavour to any other of the Canadian Grapes shown. This was raised by Professor Saunders, London, Ontario. No award was, however, made to this case. Samples of Ribston Pippin were tasted, and whilst the richest coloured fruits were

ing Russet, coloured rounds; and Edgemoor Purple, coloured kidney. 2d, Mr. J. Hughes, with Saow Queen General Gordon, and London Hero, white rounds; Snowdrop, Chancellor, and Reading Giant, white kidneys; Vicar of Laleham, Reading Russet, and Mr. Breeze, 3d. Mr. G. Allen, gr. to Sir Francis Burdett, Bart., Ramsbury Manor, Hungerford; 4th, Mr. W. Kerr. There were six competitors in this class.

Also for six dishes, to include General Gordon, Perfection, and Bountiful, were twelve. It was distributed by Mr. J. Hughes. The 1st was 1st with London Hero, Sutton's Perfection, Snowdrop, Reading Giant, Reading Russet, and Crimson Beauty. 2d, Mr. E. S. Wills, with Fidler's Perfection, Abundance, Reading Giant, Reading Russet, Vicar of Laleham, and Mottled Beauty (White). 3d, a handsome looking kidney, mottled with dark purple—handsome and promising. 3d, Mr. C. Ross, gr. to G. B. Eyre, Esq., Welford Park, Newbury; 4th, Mr. G. Allen. There were five competitors in this class.

Also for three dishes, to include General Gordon, Perfection, and Bountiful, were three. Mr. Wills was 1st, Mr. Hughes 2d, and Mr. G. Allen 3d. These were the only competitors.

Messrs. Sutton & Sons, seedsmen, Reading, offered prizes for the best dish of Sutton's Seedling and one of Sutton's Abundance, and here Mr. Wills was 1st, with several examples; indeed, Mr. Hughes being a good 2d, and Mr. E. Chipping, Perwinckle Mill, Milton, Sittingbourne, 3d. There were nine competitors.

They also offered prizes for nine varieties, selected from twenty-one varieties this firm is putting into commerce. Seven prizes were offered, and there were eleven competitors. Mr. Hughes was 1st with Favourite, Abundance, Lady Tresselt, Early Regent, Sutton's Seedling, Woodstock Kidney, Reading Russet, Prizetaker, and Reading Ruby—a very fine lot, indeed; 2d, Mr. E. S. Wills, with Favourite, Sutton's Seedling, First and Best, Early Regent, Abundance, Woodstock Kidney, Reading Russet, Prizetaker, and Reading Ruby; 3d, Mr. E. Chipping; 4th, Mr. G. Allen.

NON-COMPETING EXHIBITS.

Messrs. Sutton & Sons showed, not for competition, an extensive and thoroughly representative collection of Potatoes, arranged in groups, in all some 140 dishes; the groups including varieties sent out by Messrs. Sutton & Sons; the best English varieties for exhibition, the best for flavour, also seedlings not yet in commerce and shown under number. This was a highly meritorious exhibit. A Silver-gilt Medal was awarded.

From the gardens of the Royal Horticultural Society came a collection of fifty dishes of choice varieties tried during the past season.

Messrs. Charles Lee & Son, nurserymen, Hammersmith, had a small collection of seedling and named varieties.

Mr. Robert Fenn, The Cottages Farm, Salthamstead, had a collection of twenty-seven dishes: for garden culture, including his earliest and latest varieties—a very interesting lot indeed.

Mr. C. Fidler, Potato grower, Reading, had a very fine representative collection also, composed of some hundred dishes, shown in the best form.

Messrs. James Carter & Co. had a capital collection of about sixty dishes, and a box of their Lithuanian varieties—toy Potatoes, that will, no doubt, be of great value in some undiscovered Lithuanian, but we fear they will be of but small services in the present day. Awards were made to most of the foregoing collections.

CELERY.

The finest six heads came from Mr. W. Pope, gr. to Earl Carnarvon, Highcliff Castle Gardens, Newbury, in a competition of twenty-five lots, all of which were good. The variety securing the 1st prize was Wingrove's Aylesbury Prize Red, and the samples shown fully sustained its reputation. Major Clark's Red, shown by Mr. R. Timbs, Tyler's Gate, Amersham, was awarded the 2d prize; and Mr. G. H. Richards, gr. to Lord Normanton, Sonerley, Ringwood, gained the 3d place with Standard Bear.

PARSNIPS.

The competition in this class was even greater than that in the preceding one, there being twenty-seven exhibitors, and it is almost unnecessary to say some magnificent roots were shown. Mr. W. Meads, gr. to Viscount Harrington, Park, Sharnham, was awarded the premier prize for fine samples of Sutton's Student, which were clean and very solid. Mr. Palmer, gr. to W. F. Dick, Esq., Thames Ditton House, Thames Ditton, obtained the 2d, with good roots of Elcombe's Improved; and Mr. G. Bloxham, gr. to Sir P. Duncan, who had cured the 3d, with very creditable samples of Maltese.

CARROTS.

Mr. J. Neighbour, Bickley Park Gardens, Chislehurst, staged Sutton's New Intermediate, and secured the highest award. They have good clean roots, worthy of the award. Mr. W. Robins, gr. to E. D. Lee, Esq., Heartwell House, West Wickham, was awarded the 2d prize, with samples of the same variety, but very little inferior to those of the 1st prize lot. Mr. J. Baker, Baunton, Oxfordshire, was 3d. There were thirty-six competitors in this class, being the highest of any. A very grand show of Carrots was made by all the competing lots taken together, indeed we did not notice any that were not worthy samples.

TURNIPS.

A display of these such as we do not often see was made by thirty-five exhibitors. Mr. J. May, gr. to Captain Le Blanc, Northway House, Barnet, received the award for a splendid lot of Snowball, the roots were sound and thoroughly solid, although large. Mr. E. S.

Wills, gr. to R. A. Cartwright, Esq., Edgemoor, Banbury, followed closely upon Mr. May, with a dish of Early Six weeks. Mr. G. Bloxham, with Early Snowball, was placed 3d; this was a very good lot also.

ONIONS.

The 1st prize was awarded to Mr. W. Finlay, gr. to Lord Sondes, Lees Court, Faversham, for a dish of bulbs for outstanding his twenty-five fellow-competitors; one bulb was of great size. The variety, a cross between the white Spanish and Portugal, was called Shedwick Onion. It is quite new, and Mr. Deverill has purchased the stock. The 2d was taken by Mr. G. Neal, Bampton, Oxon, for very fair examples of Deverill's Anglo White Spanish. Mr. S. Haines, gr. to Earl Radnor, Colshott House, Highworth, was 3d, with Wroxton, also one of Deverill's Onions.

BRUSSELS SPROUTS.

Mr. Finlay also received the 1st prize here for a good dish of Wroxton. The justice of this award was self-evident. Mr. R. Lye, Symondton Court Gardens, Newbury, was 2d, with good examples of Aigburth; these were very solid and large. Mr. W. Pope was 3d. There were twenty-seven exhibitors in this class.

BEETS.

Out of thirty-two lots shown, that of Mr. J. Neighbour received, and justly, the 1st prize. The roots were very clean, solid, and large, greatly resembling Frampton's Exhibition Beet. Mr. C. J. Waite, gr. to Colonel Talbot, Gilmurst, Esher, was 2d, with very good samples of Pragel's Exhibition Beet. The 3d prize was awarded to Mr. S. Haines, for good roots of Pine-apple, which, unfortunately, had no top to speak of.

CAULIFLOWERS.

Mr. A. Miller, gr. to W. H. Long, Esq., M.P., Rood Ash, Park, Trowbridge, staged the finest lot here. The variety was Autumn Giant; these heads were very solid, compact, and very white. There were other heads larger but not so good. Mr. G. H. T. Miles, gr. to Lord Carrington, Wycombe Abbey, High Wycombe, was 2d, with heads hardly inferior to the 1st prize lot. Mr. W. Meads was awarded the 3d prize for good heads, which, however, were rather odd. There were twenty-eight exhibitors in this class.

LEEKS.

Mr. G. T. Miles was the leading exhibitor here, showing a very fine lot, very thick, and conveniently long. The variety was The Lyon; also good, but rather smaller, were those staged by Mr. C. Ross, gr. to G. B. Eyre, Esq., Welford Park, Newbury, Ayton Castle Giant being the name of the variety. The 3d prize was taken by Mr. J. Waite, with good bulbs of Sutton's Prizetaker, a variety of a longer growth than the other two mentioned. There were eighteen exhibitors.

TOMATOES.

Mr. R. Farrance, Chadwell Heath, Essex, staged the finest dish of Trophy Selected, a very good lot, the fruits being very clean, sound, and large. The 2d prize was awarded to Mr. F. Hughes, gr. to J. Smith, Esq., Warrington, for a good dish of Reading Perfection; and Mr. W. Meads made a close 3d with very well grown fruits. In all, there were also eighteen lots staged for competition.

COLLECTIONS.

One of the finest displays of collections of vegetables was that brought forward by the prizes offered for competition. There were nineteen separate collections, all of good quality, and the exhibitors who won the awards staged vegetables fully worthy of such recognitions. The most successful exhibitor was Mr. G. T. Miles, whose collection of eight kinds attracted general attention. The following vegetables comprised this lot—Celery; Leicester Red; Brussels Sprouts; Imported; Tomato; Sturmfurder; Cauliflower; Veitch's Autumn Giant; Onion; Caves Pinesfield; Carrot; Sutton's New Intermediate; Leek; The Lyon; Potato; Chancellor. Mr. J. Neighbour was 2d, with also a very fine lot, consisting of—Peas; The Plus Ultra; Sprouts; Pragel's Exhibition; Broccoli; Sutton's Michaelmas White; Carrot; Sutton's New Red Intermediate; Mushrooms; Potato; Vicar of Laleham; Onion; White Globe; and Tomato; Reading Perfection. The 3d prize was awarded to Mr. S. Haines, whose finest items were—Cauliflower; Autumn Giant; Parsnip; Student; Leek; The Lyon.

SPECIAL PRIZES.—MR. DEVERILL'S.

For a collection of Onions of six of each of the following varieties—Deverill's Rousham Park Hero, Deverill's Anglo White Spanish, Devonshire Main, and Finlay's The Wroxton. There were seven exhibitors, and, in a keen competition, Mr. H. Wingrove, gr. to R. W. Byass, Esq., Rousham, Steeple Aston, Oxon, was awarded the 1st prize, for a most creditable lot, of handsome appearance and great worth. A good 2d was made by a collection of Mr. J. J. Burrow, Denny Hassocks, Sussex; Mr. T. Doherty, gr. to Lord North, Wroxton Abbey, Banbury, and Mr. E. S. Wills were respectively 3d and 4th, both exhibitor's collections being very good in all respects.

SUTTON & SONS' CELERY.

For the best three sticks of Sutton's White Gem there were fifteen competitors, Mr. G. H. Richards showing the best, and receiving the highest award; his sticks were of first-rate quality, but he was closely followed by Messrs. Sutton & Sons, of the Southam District, Sutton, and by Mr. C. J. Waite, who were respectively 2d and 3d.

BEET.

For Sutton's Dark Red there were two more exhibitors than for Celery, viz., seventeen. Mr. J. C. Waite was to the fore here with highly creditable roots; Mr. J. Hughes was 2d, also with very good roots; and Mr. G. T. Miles was 3d.

CARROTS.

This class brought a great number of competitors, as many as twenty-nine lots entering the competition, which seems to have been expected, as four prizes were offered in the schedule. The prizes were offered for New Red Intermediate, which, judging from the samples staged, is a very good variety for exhibition purposes. Mr. J. Neighbour was 1st, Mr. W. Robins a close 2d, and Mr. G. H. Richards was 3d, while 4th was awarded to Mr. J. Baker, all being very close on each other.

LEEKS.

Prizetaker was the variety, and a dozen lots were staged, making a good show; Mr. C. J. Waite, Mr. G. T. Miles, and Mr. J. Spottiswoode, Queen's Park, Brighton, gaining the prizes in the order of their names.

PARSNIPS.

Mr. R. Lye had the best dish of Student Parsnip among twenty-one lots staged, and was followed by Mr. H. Richards and Mr. S. Haines, who were 2d and 3d respectively. The 1st prize lot was specially fine, and fully merited the award.

MISCELLANEOUS.

From Mr. Deverill, Banbury, came an extensive and interesting collection of various veg-tables, comprising several of his specialties. Among other things were Onions, Anglo White Spanish, Rousham Park Hero, Improved Wroxton, Main Crop, &c.; the Wroxton Sprouts; Middleton Favourite; The Plus Ultra; Earl's Own Scarlet Horn Carrot, and Wingrove's Prize Red Celery. We have spoken minutely of all these before, consequently we merely mention them now.

Mr. A. Miller staged a collection of Onions comprised of the above-mentioned varieties.

EXETER APPLE AND PEAR SHOW.

This exhibition took place on October 21 and 22, and was held in the Fore Street Market as usual. The building had been so transformed by drapery, evergreens, &c., that no one could imagine they were parading a busy provision market, so elegantly and tastefully had the decorations been carried out. Plans for the decoration of the fruit-stands were kindly lent by Messrs. Veitch & Son and Messrs. Lucombe, Pince & Co., both of Exeter. The number of entries was more numerous than on any previous occasion, as many as fifty late entries being refused. The different counties of Devon, Kent, Cornwall, Hereford, Somerset, and Dorset, were represented by some ninety exhibitors, their produce being a better average as regards size and quality of the fruit than last year, but deficient in colour. The Kent fruit took the lead in most of the open classes; Hereford, taking up a better position than last year, carried off many second honours, while the home county, which excelled last year, was obliged to be content with third place. Devonshire has suffered much from excessive drought during the past year, which accounts for the lack of size of fruit, but the absence of colour seems general with all. The English crown fruit was very represented by a collection of Canadian fruit sent by Mr. Starr, some of remarkable size and colour, the flavour of some varieties excelling English fruit, at the present time being quite one month ahead by its degree of ripeness, but there is no doubt our English grown fruit is the best, having a longer period for ripening.

Pears were fair on the whole, and the various classes strongly contested, many kinds being much smaller than usually shown; no doubt, to the immense crops everywhere this past season.

Since the commencement of the annual exhibitions, now in their third year, the exhibits have steadily improved in selection and cleanliness. Apples were of a more uniform size than last year, showing a better average, though many varieties were exhibited last year much finer, and the colour was grand. The newer varieties of merit have, by the aid of this and kindred societies, found their way into almost every collection staged, which indicates that some good and useful work is being done; and no doubt much will be done by this Society, conducted as it is by a very energetic secretary and treasurer, ably assisted by a good practical committee.

APPLES.

Twenty-four dishes, distinct,—Messrs. Bunyard, of Maidstone, Kent, were awarded 1st, for an excellent collection, of large size and clean fruit, of the following varieties—Gloria Mundi Beauty of Kent, Lord Seaford, Reineette du Canada, Pott's Seedling, Lord Seaford, Tower of Glamis, Stirling Castle, New Hawthornden, Ecklinville, Alexander, very fine, and highly coloured; Peasgood's Nonsuch, Warner's King, Stone's, Tibbett's Pearmain, Lady Henniker, Cox's Pomona, Gospatric, Salmarsh's Queen, Golden Noble, Lord Derby, Meloa Apple, Cellini, and Lane's Prince

Albert. 2d, Mr. Watkins, Pomona Farm, Withington, Hereford, also with a very clean lot, his best being Striped Redding, green and red Costard's, Mère de Mécange, Blenheim Orange, Yorkshire Beauty, Duchess of Oldenburg, Winter Nonsuch, &c. 3d, Mr. C. Sclater, Heavitree, Exeter, who followed closely.

Twelve dishes, distinct.—Again Messrs. Bunyard came to the front with a splendid lot—Lord Derby, Warner's King, Stone's, Salmarsh's Green, and Alexander being especially fine. Mr. Watkins followed closely with good fruit. 3d, Mr. H. Berwick, Sidmouth Nurseries.

Twelve dishes, dessert.—1st, Messrs. Bunyard, whose collection comprised the following:—Cox's Orange Pippin, Melon Apple, Lady Henniker, Herefordshire Crispin Queening, Ribston Pippin, Worcester Pearmain, King of the Pippins, Wealthy, Blenheim Orange, Colonel Vaughan, Washington, and Cellini; this latter is generally considered a culinary Apple. 2d, Mr. C. Sclater, whose collection was excellent also; 3d, Mr. J. Scott, Merriott.

Twelve culinary, distinct.—1st, Messrs. Bunyard, with several fine dishes, the best being Striding Castle, Stone's Gloria Mundi, Lord Derby, Beauty of Kent, Salmarsh's Queen, Warner's King, New Hawthornden, Cox's Pomona, Ecklinville, Alexander, and Lane's Pince Albert; 2d, Mr. J. Watkins; 3d, Mr. D. C. Powell, Powderham, Kenton, Exeter.

Nine dishes, dessert, distinct (prizes offered by Messrs. Bunyard).—1st, Mr. C. Sclater, in whose collection were staged some capital fruit—Red-ribbed Greening, a handsome and good flavoured variety; Devonshire variety, Royal Somerset, Blenheim Orange, Orange Pippin, Cornish Aromatic, and Gilliflower, Ribston, King of the Pippins, and Count Fendu-plat. 2d, Mr. H. Berwick.

Twelve varieties cider fruit, distinct.—1st, Mr. E. P. Uglow; 2d, Mr. Garland, gr. to Sir T. D. Acland; 3d, Mr. B. Salter.

Eighteen dishes, distinct (for private growers).—1st, Mr. G. Brooks, gr. to A. Vaughan Lee, Esq., Dillington Park, Ilminster, whose best dishes were Alexander, Beauty of Kent, Peasgood's Nonsuch, Royal Somerset, Royal Russet, Cellini, Alfriston, Cox's Orange Pippin, Mère de Mécange, Lady Henniker, and Warner's King; 2d, Mr. Garland, whose Blenheim Orange, Cox's Pomona, and Mère de Mécange were good; 3d, Mr. W. Sleat, gr. to E. V. Hawkins, Esq., Edgerton Park.

Nine dishes, dessert, distinct.—1st, Mr. G. Brooks, whose collections included several unknown varieties very similar to each other; 2d, Mr. Garland, who staged well, his best being Alexander Russet, Blenheim Orange, fine colour; King of the Pippins.

Nine, culinary.—1st, Mr. A. Truman, Countess Weir, Topsham, with some excellent fruit of Dumelow's Seedling, very fine; Gloria Mundi, Alfriston, Warner's King, Blenheim Orange, Ecklinville, Golden Noble, Flower of Kent, Hollow Core, and Beauty of Wilts; 2d, Mr. A. C. Williams, gr. to W. C. Sim, Esq., Clyst St. George.

Nine dishes, distinct.—1st, Mr. J. Baker, gr. to Mrs. Rowe, Lafronda, Exeter; 2d, Mr. J. Blythe, Ide; 3d, Mr. P. Slade, gr. to W. H. Cocks, Esq., Broadclyst.

SINGLE DISHES.

One dish of Apples, by Devonshire cottagers.—Twenty-five competitors. 1st, Mr. J. Hincho, Sownton, with Blenheim Orange; 2d, Mr. W. Gibbings, Topsham, with Warner's King, very fine; 3d, Mr. S. Steer.

Single dish, best flavour.—1st, Miss Matthews, Crediton, with Cox's Orange Pippin; 2d, Messrs. Bunyard, same variety.

Heaviest dish.—1st, Mr. W. Blackmore, with Warner's King, the heaviest fruit weighing 1 lb. 6 oz. and 5 drms.; Messrs. Bunyard being 2d, with the same variety; and Mr. J. Fowlesland, gr. to C. J. Luscombe, Esq., Hill's Court, 3d.

Alfriston.—1st, Mr. G. May, Topsham, Blenheim Orange.—Twenty-eight competitors. 1st, Mr. J. Beer, Cullumpton.

Golden Noble.—Seven competitors. 1st, Mr. D. C. Powell.

Lord Suffolk.—Twelve competitors. 1st, Messrs. Bunyard.

Old Hawthornden.—Six competitors. 1st, Mr. J. Fryer, who staged Dumelow's Seedling, and overlooked by the judges.

Warner's King.—Twelve competitors. 1st, Mr. W. Blackmore.

Dumelow's Seedling.—Twenty-one competitors. 1st, Mr. A. Truman.

Any other culinary.—Thirty-one competitors. 1st, Mr. G. Brooks, with a fine dish of Peasgood's Nonsuch; 2d, Mr. R. Salway, gr. to C. R. Collins, Hele, with Alexander.

Cornish Gilliflower.—Twenty competitors. 1st, Mr. W. R. Baker, gr. to Rev. P. L. D. Acland.

Count Fendu-plat.—Nine competitors. 1st, Mr. C. Sclater.

Cox's Orange Pippin.—Twenty-four competitors. 1st, Messrs. Bunyard.

Gravenstein.—Seven competitors. 1st, Mr. J. Stenker.

King of the Pippins.—Seventeen competitors. 1st, Messrs. Bunyard.

Margil.—Nine competitors. 1st, Mr. J. Mogridge, gr. to Mrs. Ord, Topsham.

Mère de Mécange.—Four competitors. 1st, Mr. J. Searle, Crediton.

Ribston Pippin.—Thirty competitors. 1st, Messrs. Bunyard.

Any other dessert.—Forty-three competitors. 1st, B. C. Gidley, Esq., Town Clerk, Exeter, with Gidley's Pearmain, one of his own raising; 2d, Mr. J. Hall, Bridge Mills, Cullumpton, with Adam's Pearmain.

FEARS.

Twelve dishes, distinct.—Eight competitors. Here again Messrs. Bunyard took the lead, showing remarkably well. The varieties consisted of Beurri Claigne, Beurri Diel, Durondeau, Catillac, Beurri Bachelier, Titmaston Duchesse, Doyenné du Comice, Marie Louise d'Uccle, Louise Bonne de Jersey, Beurri Superfin, Beurri d'Ecully, and Grosse Calabasse. Mr. Garland was a good 2d, having Titmaston Duchesse, Beurri Bosc, Bon Curé, and Winter Nelis, extra good. 3d, Mr. C. Sclater.

Six dishes, distinct.—Seventeen competitors. 1st, Mr. R. Salter, gr. to J. Carver, Esq., Chilton Polden, with Maréchal de la Cour, Beurri Rance, Louise Bonne de Jersey, Doyenné du Comice, Pitmaston Duchesse, and Marie Louise, all of them excellent; 2d, Mr. Garland; 3d, Mr. H. Berwick.

Three dishes, dessert.—Nineteen competitors. 1st, Mr. D. C. Powell, with Beurri Claigne, highly coloured; Marie Louise, and Muirfow's Egg; 2d, Mr. G. Morrinder, gr. to F. Bradshaw, Esq., Lifton Park.

Three dishes, culinary.—Seven competitors. The fruit in these classes were small compared with former years. The 1st prize fell to Mr. A. C. Williams, with Uvedale's St. Germain, Catillac, and Bellissime d'Hiver; 2d, Mr. W. S. Lee.

SINGLE DISHES.

Catillac.—Eleven competitors. 1st, Mr. J. Ham, Broadstair, with fruit from the wall—clean and highly coloured.

Uvedale's St. Germain.—Twelve competitors. 1st, Mr. G. Brooks.

Any other variety, culinary.—Nine competitors. 1st, Mr. Truman, with Black Worcester—fine.

Beurri Diel.—Seventeen competitors. 1st, Mr. Geeson, gr. to Lord Haldon, with very fine fruit.

Doyenné du Comice.—Six competitors. 1st, Mr. G. Brooks.

Easter Beurri.—Nine competitors. 1st, Mr. J. Searle, with a large sized and clean dish.

Glou Morgau.—Seven competitors. 1st, Mr. R. Smith, gr. to Lady Fletcher, Yalding.

Josephine de Malines.—Eight competitors. 1st, Mr. A. C. Williams.

Knight's Monarch.—Four competitors. 1st, Mr. A. C. Williams.

Louise Bonne de Jersey.—Eighteen competitors. Too late for this variety to show well. 1st, Mr. Garland; large fruit.

Marie Louise.—Twenty-two competitors. A fine lot of fruit in many cases were staged. 1st, Mr. R. Smith.

Pitmaston Duchesse.—Ten competitors. The specimens exhibited in this class were not so fine as usual. 1st, Mr. A. C. Williams.

Winter Nelis.—Twelve competitors. 1st, Mr. R. Smith.

Any other dessert.—Forty-one competitors. 1st, Messrs. Bunyard, with Beurri Claigne.

MISCELLANEOUS.

Quince.—1st, Mr. Sclater.

Twelve Tomatos.—1st, Mr. Truman, with Stamfordian; 1st, Rev. E. W. T. Wrey, with the Dutch variety.

Messrs. Veitch & Sons, of Exeter, staged a fine collection of Apples and Pears, comprising nearly 100 varieties of Apples and forty of Pears. The principal varieties among Apples were: Sandringham (new), Loddington Lane's Prince Albert, Golden Noble, Bauman's Red Reinette, Schoolmaster, Clagyte Pearmain, Fearo's, Hollandbury, &c. The same firm staged a miscellaneous collection of other fruits, such as Filberts, Cob-nuts, Walnuts, Spanish Chestnuts, English grown Almonds, &c.

Messrs. Lucombe, Pince & Co. also put up fine collections with a similar number of dishes of both Apples and Pears in excellent condition. They had among their Pears, Van Mons Lion, le Clerc, Vicar of Winkfield, Uvedale's St. Germain, and Gilgil, very fine. Of Apples, Tibbet's Pearmain, a fine hand-some exhibition Apple; Blenheim Orange, Lord Paulett's Pearmain, Cox's Pomona, Brabant Belle-fleur, and Alexander Russet, very good. The firm also exhibited a collection of Tobaccos grown by them at their Exeter Nurseries.

The Weather.

- Oct. 21.—Thick mist in morning, fine but dull all day.
- 22.—Fine and bright.
- 23.—Wet; dull overcast day throughout.
- 24.—Morning fine, and cold; generally overcast from noon.
- 25.—Slight rain in early morning; overcast all day.
- 26.—Overcast throughout, with strong wind.
- 27.—Wet and overcast all day.

LONDON: Atmospheric Pressure.—During the week ending October 23d, the reading of the barometer at the level of the sea increased from 28.81 inches at the beginning of the week, to 29.71 inches by 1 P.M. on the 20th, decreased to 29.67 inches by the afternoon of the same day, increased to 30 inches by the morning of the 22d, decreased to 29.97 inches by 5 P.M. on the same day, and was 30.10 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.67 inches, being 0.24 inch higher than last week, and 0.21 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 59° on the 19th and 20th; the highest on the 17th was 53° 3'. The mean of the seven high day temperatures was 55° 6'.

The lowest in the week was 38° on the 22d; the lowest on the 17th and 20th, was 47°. The mean of the seven low night temperatures was 43° 4'. The greatest range of temperature in one day was 16° 5' on the 18th and 22d, the smallest was 6° 3' on the 17th. The mean of the seven daily ranges was 12° 2'.

The mean daily temperatures were, 48° 8' on the 17th, 47° 5' on the 18th, 51° 4' on the 19th, 52° 5' on the 20th, 48° 7' on the 21st, 46° 2' on the 22d, and 48° 7' on the 23d. These were below their averages on the 17th, 18th, 21st and 22d, by 1°, 2°, 2°, 0° 3', and 2° 5' respectively, and above on the 19th, 20th, and 23d by 1° 9', 3° 2', and 0° 4' respectively.

The mean temperature of the week was 49° 1', being 2° 2' lower than last week, and 0° 1' below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 90° on the 22nd. The mean of the seven high readings was 68° 5'.

Rain.—Rain fell on three days to the amount of 0.14 inch.

ENGLAND: Temperature.—During the week ending October 16th, the highest temperatures were 61° at Truro, 59° 8' at Bradford, and 59° at Blackheath; the highest at Newcastle was 53°, at Wolverhampton 53° 4', and at Sunderland 54°. The general mean was 56° 9'.

The lowest in the week were at Truro, 52°, at Hull 53°, and at Wolverhampton 35°; the lowest at Newcastle was 44°, at Liverpool 43° 3', and at Preston 41°. The general mean was 37° 9'.

The greatest ranges of temperature were at Truro 29°, at Hull 25°, and at Sheffield 22°; the least ranges were at Newcastle 90°, at Liverpool 13° 4', and at Sunderland 14°. The general mean was 19°.

The mean of the seven high day temperatures was highest at Truro 58.3, at Plymouth 56, and at Blackheath 55.6, and lowest at Wolverhampton 51.8, at Newcastle 52.4, and at Sudderland 52.7. The general mean was 54.4.

The mean of the seven low night temperatures was highest at Newcastle, 46.8, and at Sheffield and Preston 46.1, and lowest at Wolverhampton, 40.4, at Plymouth 41.8, and at Bristol, 42.2. The general mean was 45.4.

The mean daily range was greatest at Truro 12.9, at Plymouth 14.2, and at Bristol 12.4; and least at Newcastle 5.2, at Sudderland 6.9, and at Liverpool 7.6. The general mean was 10.7.

The mean temperature was highest at Truro 49.9, and at Sheffield and Preston 49.3; and was lowest at Wolverhampton 44.9, at Bristol 47.4, and at Plymouth 47.9. The general mean was 47.9.

The largest falls were 1.94 inch at Nottingham, 1.55 inch at Sheffield, and 1.23 inch at Liverpool; the smallest falls were 0.14 inch at Blackheath, 0.15 inch at Brighton, and 0.41 inch at Leeds. The general mean fall was 0.82 inch.

SCOTLAND: Temperature.—During the week ending October 23d, the highest temperature was 67° at Greenock; the highest at Aberdeen was 53.5°. The general mean was 55.3°.

The lowest temperature in the week was 30° at Perth; the lowest at Greenock and Leith was 37°. The general mean was 34.1°.

The mean temperature was highest at Aberdeen 48.8; and lowest at Perth 46°. The general mean was 47.6°.

Rain.—The largest fall was 1.70 inch at Edinburgh, the smallest fall was 0.07 inch at Greenock. The general mean was 0.65 inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

TO THE TRADE.—Members of the Trade will oblige by sending notes of matters of Trade interest. Short notes of daily experience are what are most useful.

CORRECTION.—In "Cattleya Mesauri" ("Orchid Notes," &c., p. 526) we erred last week in giving Mr. Salter as the gardener at the Woodlands instead of Mr. R. W. Fraser.

ERGOT: G. P. Yes; certainly on Rye-grass. FUNGUS: F. W., Sheffield. The fungus is named Agaricus unguis, from its verdigris-green colour. It is not unguis, but is worthless, if not poisonous. Correspondents should not wrap up glutinous fungi in wool.

GRAPE SPLITTING, AND MILDEW IN MUSCATS: F. C. K. You have probably cut away too much of the lateral growths, or thinned the bunches very severely, and made matters worse by giving water at the roots in the evening instead of in the morning. The splitting may be occasioned by any of these, but your letter gives no clue. Cut the bunches at the pedicels, and smear the hot-water pipes, or other heating means, with lime, clay, and sulphur; and keep up a dryish atmosphere instead of a cool and moist one, which favours the development of mildew. Do not give ventilation by the front sashes of the vinery unless the weather should prove warm.

GROS COLMAR GRAPES: F. Witherpoon. The berries were very fine, but owing to the way in which they had been sent, most of them were smashed, and the bloom was entirely destroyed; but the flavour was excellent. We do not see how the "Red Rose" boiler could have influenced the quality of these Grapes, for good fruit can be grown by any other means of heating, or with none.

INSECTS: A. W. Your small bulbs of Cattleya Mossiae are attacked by the small hymenopter insect, Issosoma Orchidearum ("I. O. W." in Gardeners' Chronicle, 1869, p. 1230), the small white larva of which does great harm by the frunt sashes of the little black fly are now (end of October) appearing in the perfect state.—F. S. Your Cattleya bulbs are producing the perfect little black flies (Issosoma Orchidearum), as described in the preceding reply.—H. K., Sydney. The green caterpillar which has destroyed your Tobacco plants is of a different species from those which attack Cabbages, Gooseberries, and Beetroot. It produces a moth found in North America, figured by Abbott and Smith (Insects of Georgia, 2, pl. 100) under the name of Platanea Rhexite (the Tobacco-bud worm moth). Cut G. H.

NAMES OF FRUITS: C. P. Specimen sent quite decayed.—Alfred N. Jones, 1. Beurré d'Amélie; 2. Paradis d'Autonne; 3. Knight's Monarch. Apple: 1. Duke of Devonshire; 2. Boston Russet; 3. Cox's Orange Pippin; 4. not recognised; 5. Warner's King.—F. Briggs, 1. Golden Noble; 2. Tower of Glamis; 3. Hambleton Deux-ans.—Carver, 1. Rose de Co. 1. Mère de Ménage; 2. Red Autumn Calville.—C. F. W., 1. Nonsuch; 2. Fearn's Pippin; 3. Louise Bonne of Jersey; 4. Hacon's Incomparable; 5. Bergamotte d'Espéran; 6. Josephine de Malines.—G. T. B. Names not known.

NAMES OF PLANTS: Oxford. Helianthemum vulgare.—Fitzroy, 1. 2. Bromeliads, of which we will give you the name next week, if possible. The other things arrived in such a condition that we cannot undertake to give them names.—F. W. M. Probably both Syringa Emodi. Why not send better specimens? Do you think it possible to name plants from withered leaves only, and without a particle of information?—K. W. L., 1. Thuja orientalis var. aurea; 2. Rhus typhina; 3. Abies Nordmanniana; 4. A. Pinaapo; 5. Larix; 6. Juniperus? But the specimens are so poor that all these names are given with hesitation, and we cannot vouch for their absolute correctness.—H. Y. R. An Ornithogalum, of which we will endeavour to give you the name next week.—W. A. M. Cotonaster frigida.—Ross. Ornithogalum lacteum, Jacq.—F. H. Pitcairnia bromelioides, or allied species.—Col. Berkeley. Dendrobium Cambridgenum; the flowers are pale from its blooming out of season.

PINES PLANTED IN THE PONTINE MARSHES: H. S. Probably Pinus halepensis; P. Pinea.

PLANTS IN GLAZED POTS.—W. We do not recommend them. The soil gets sodden and sour from want of sufficient evaporation and airing of the roots.

SEED OF GOLDEN MOHR: H. I. The seeds are those of the Flamboyant (Poncanna regia), a leguminous tree of Madagascar. F. J. R. J.

SWEET WILLIAM DISEASED: E. W. H. The leaves are affected with Puccinia dianthi. Cut off all leaves showing spots and burn them. Slight dusting with flowers of sulphur may kill it but not very prevalent.

TROPICAL PRODUCTS: H. C. Susan. In The Tropical Agriculturist, compiled by A. M. and J. Ferguson, Colombo, Ceylon, 1882-1883, many papers are to be found on Cacao, Cloves, Manioc (Cassava), Nutmegs, Peppers, and Aloes.

COMMUNICATIONS RECEIVED:—Wild Rose.—W. H. R.—D. D.—D. W. C. G. H. G. F. P.—W. F.—A. Blumfeld.—A. B. J. D.—H. R. R.—F. P.—W. W.—C. A.—W.—J. G. W.; we cannot enter into these boiler discussions.—J. D. & Sons.—O. T.; the Ficus has not come to hand.—B. H.—Harge & Schmidt.

Markets.

COVENT GARDEN, October 28.

LARGE supplies of Grapes still reaching us from the Channel Islands, keeping down the price of home-grown fruit. American Apples not coming in freely. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit names and prices. Includes Apples, Pears, Pine-apples, Figs, Lemons, Melons, Peaches, Pears, Pine-apples, Plums.

Terms net cash 1 month. For further particulars, apply to

W.M. G. MAC GREGOR, 17, Fenchurch Street, E.C.

Our Chrysanthemums.

AS Large and Complete as our Display and Stock has hitherto been, it is largely eclipsed by that of this season. Our two houses, specially built, 200 feet by 20 feet wide, are found much too small for the 150 varieties, many direct from Japan, and 175 new kinds; all will be found grandly in bloom, for comparison and criticism. This grand display is beyond all question the most complete in Europe—me huge bank, 1200 feet long. Our stock of plants in 4-inch pots, full of cuttings expressly for exportation and immediate propagation, is immense, and we respectfully invite all to "come and see," or send for our Catalogue, containing the most invaluable information—how to grow, and use of the necessary appliances for exhibiting, and which is acknowledged to be the best descriptive and illustrative book of the whole family ever published.

TWEEZERS—STEEL ... 1s. 6d. per pair. **IVORY** ... 4s. 6d.

J. WEEKS & CO.'S PATENT DUPLEX UPRIGHT TUBULAR BOILER,

With Hollow Furnace Bars, Patent Diaphragm, and Fuel Economiser.

WEEKS'S BOILERS are beyond all comparison those which offer the **Greatest Value to Purchasers**, and most combined advantages to Gardeners. Their merits so far exceed those of any other Boiler that almost every new Boiler brought into the market in some degree imitates them, and this notably with respect to the Hollow Furnace Bars, the use of which has been advocated by J. WEEKS AND CO. upwards of 40 years, and who have proved that the Water gains on an average from 20 to 25 degrees of heat in its passage through their Hollow Furnace Bars before entering the Boiler.

Full particulars, and Illustrated Price List of Boilers, also New Book of Designs, 13th edition, post-free on application.

Address—J. WEEKS & CO.,
Horticultural Engineers and Patentees,
KING'S ROAD, CHELSEA, S.W.

Extract from the "Lady's Pictorial" of 23d Oct., 1886.

"Most of our readers are already familiar with the beauty and merit of the **Darlington Dress Fabrics** Manufactured by Messrs. **HENRY PEASE & Co.'s** Successors, at the Mills, **Darlington.**

"The Novel Patterns and Designs especially prepared for the present season are exceptionally successful, both as regards colour and texture, and we can thoroughly recom-

mend these goods to the notice of our readers as being entirely suitable for autumn and winter wear. Large Boxes of Patterns will be sent immediately upon application at the above address, and the novelty and beauty of the fabrics will quickly con-

vince our readers that they deserve the highest praise.

"It is impossible to over-estimate the immense advantages of obtaining goods in this manner direct from the original manufacturers, since there remains literally only one man, and therefore only one profit, between the wool-producing animal and the person who eventually wears the woollen goods. Where there is only one profit to be made, as in this case, it is clearly evident that the purchaser must benefit largely, since there is no middle man to swallow up the intermediate gains. This being so, our readers will do well to make the most of their opportunity, and write at once for Patterns, which are naturally greatly in demand at the present season of the year.

"We must mention as specially appropriate just now the Darlington Cross-warp Serges, the all-wool *foules*, and the Gold Medal Cashmeres, for these materials, together with all the other Darlington Dress Fabrics, are fine and soft in texture, artistic in colouring, and entirely novel in design."

HENRY PEASE & CO.'S SUCCESSORS, DARLINGTON. [Established in 1752.]

All Parcels are Carriage Paid, and any Article can be Changed within Seven Days.

FAWKES' Slow-combustion HEATING APPARATUS.
 —Most efficient and cheapest in existence. Requires no stink-stoke-hole and no brick setting. Will last all night without attention. Will burn house cinders, therefore costs next to nothing for fuel. Any one can fix it. A domestic servant can stoke it.

Boilers Delivered Carriage Paid from £2 10s

Numbers in use all over the country.

Only Slow Combustion Apparatus of the kind.

Beware of inferior incomplete Apparatus, which will not last at all.

Full particulars and Prices of every sized Apparatus, and numerous Testimonials for last three seasons, showing enormous success, postage free on application.

CROMPTON & FAWKES,
 CHELMSFORD.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stoke-hole, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside, so that the whole of the heat from the Boiler itself is utilised. It burns over twelve hours without attention, at a nominal cost.

Price, as engraving, with Boiler, or on feed syphon, 12 feet of 4-inch hot-water pipe, and patent joints complete, £14 4s. Delivered free to any station. Discount for cash. Cost of apparatus complete for Greenhouses as below, delivered free with pipes cut and fitted ready for fixing—

10 x 6 feet ..	£14 0	20 x 10 feet ..	£7 0
12 x 8 feet ..	5 10	25 x 12 feet ..	6 15 8
15 x 9 feet ..	5 10 8	30 x 16 feet ..	12 4

Proportionate prices for other sizes. Estimates free.

Illustrated LIST, with full particulars of these and every description of Fuel, Gas, and Oil Heating Stoves, free.

DEANE & CO.,
 HORTICULTURAL BUILDERS AND HOT-WATER ENGINEERS,
 46A, King William Street, LONDON BRIDGE.

C. FRAZER,
 Horticultural Builder, Norwich.
THE "RAPID" PROPAGATOR

Is the best and cheapest for striking cuttings, sowing seeds, or propagating any thing requiring a bottom-heat. Strongly made. Price includes Lamp and Registered Central Heating Kettle, as engraving. Cost of working reduced to a minimum, as all heat generated in utilised. At this season no garden should be without one.

No. 1, 3 feet 6 inches high by 2 feet 6 inches long, by 2 feet 10 inches wide, £1 17s. 6d.

No. 2, 3 feet 6 inches high by 3 feet long by 2 feet wide, £2 10s. 6d. long 5s.

CASTLE HILL WORKS, NEWCASTLE, STAFFORDSHIRE.

THE NEW PATENT TUBULAR
COMBINATION STAKE AND CLIP,
 For Trees, Roses, Dahlias, &c.
 (CARTWRIGHT'S PATENT)

THIS PATENT STAKE AND CLIP is at once simple, effective, durable, economical, and safe. It does away with the necessity of tying with wire or grass; and when once the tree is fixed in position it is utterly impossible for it to get loose again by the action of the wind or weather; in fact, it must remain fixed in position until the gardener himself loosens it. Does not harbour insects and their eggs as do string and cloth.

The Stake itself is a wrought-iron tube, and is made in various lengths, from 3 feet up to 7 feet 6 inches.

The Spring Clips are supplied in various sizes, of 1, 1½, and 2 inches across the ring when shut, and are coated with soft indiarubber.

Light Brass Caps are also supplied when required. These Caps are fixed on the top of the tube to keep the rain and ear-wigs, &c. from getting in it.

We can also supply these
STAKES ADAPTED FOR RASPBERRY CANES
 WHEN GROWN IN CLUMPS.

These Stakes are supplied with two large Wire Clips, one on each side of the Stake, as shown in sketch.
 MAY BE OBTAINED FROM ALL SEEDSMEN, &c.

Wholesale from **CORY, SOPER, FOWLER & CO. (Limited),** London; **OSMAN & CO.,** London; **BENJAMIN FIELD,** Swan Place, Old Kent Road, London, S.E.; or, from the Manufacturers, **The PLASKYNASTON TUBE COMPANY (Limited),** Raubon.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainer sorts are specially suited for K I T C H E N GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense.

as do "crown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER and CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for KENT'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price LISTS Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 2s. per square yard upwards. Pattern Sheet of Plain or elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Water-pipes, Drain-pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. F. ROSHER and CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pit to any Railway Station. Samples of Sand free by post.

FLINTS and BRICK BURRED for Rockeries or Ferneries. **KENT PEATS or LOAM** supplied at lowest rates in any quantity.

F. ROSHER and CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

THIS VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew, and elsewhere, and is the basis of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
 Sold in Casks of about 20 gallons each, at 1s. 6d. per gallon, at the Mannactory, or 1s. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq., The Ryeley, Atterbury Lodge.
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to—

HILL & SMITH, Brierly Hill Ironworks near Dudley; 113, Queen Victoria Street, London, E.C.; and 126, Stephen's Green, Dublin.

PORTABLE PLANT FRAMES.

The above are without exception the most useful kind of Frame for Plant Growing, and every one with a garden should possess one. The sashes turn right over one on the other, and the boxes are put together with wedges, and can be taken apart in a few minutes. Sizes and prices, carriage paid to any station in England, ready glazed and painted:—

WANTED, an ASSISTANT, in a Retail Seed, Flower, and Fruit Business in the South of England.—R. G., Hurst & Son, 152, Houndsditch, London, E.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 43, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been mife payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the Number of the copy by which to identify the order; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish Repeated.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BALIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

HOLLOWAY'S OINTMENT and PILLS.

—Counsel for the Delicate—Those to whom seasons of changeable temperatures are protracted periods of trial should seek the earliest opportunity of removing all obstacles to good health. This cooling Ointment, perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quiesce, relaxed tonus, sore throat, swollen tonsils, ordinary catarrhs, and bronchitis, usually prevailing at this season, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment. This Ointment, perseveringly rubbed upon the facility with which they successfully conquer influenza; they ally in an incredibly short time the distressing fever and teasing cough,

BRADBURY, AGNEW, & Co., Lombard Street, Precinct of Whitefriars, City of London, in the County of Middlesex, and Published by the said WILLIAM RICHARDS, at the Office, 41, Wellington Street, Parish of St. Paul's, Covent Garden, in the said County.—SATURDAY, October 30, 1886. Agent for Manchester—JOHN HAYWOOD.

Novelty!
CUPRESSUS LAWSONIANA ROBUSTA.
 This variety, raised by me in 1874, and introduced into the Trade in 1881, is distinguished by its strong, erect growth, and beautiful dark green colour. It is one of the hardest varieties ever raised. It did not suffer in the least even in the severe winters of 1879, and 1880, when most varieties of Cupressus were more or less injured. Plants of 8 inches, £6 per 100; 2 feet 8 inches, £3 per 100.
 Wholesale Trade CATALOGUE free on application.

BAUMFORTH'S SEEDLING RASPBERRY.

THIS new and splendid Raspberry has now so thoroughly established itself a popular favourite with the Growers for Market, the Gentleman's table, and especially the Exhibitor, throughout the Kingdom, that it is almost superfluous now to make a repetition of its merits in detail. Suffice it to say, during the time I have had the pleasure of introducing it, I have been favoured with orders for over 450,000 plants, which are distributed over all parts of the World, and the hundreds of voluntary testimonials received in its favour fully confirm my previous description of its sterling properties, and entitle it to be classed the most popular and finest variety of Raspberry in cultivation, alike for produce, size, deep crimson colour, quality, and strong robust constitution.

I am offering Canes this season at the following reduced prices:—
 Planting Canes, 15s. per 100. 3s. per doz.
 Fruiting Canes, 22s. 6d. per 100. 4s. per doz.
 Price to the Trade on application.
 EARLY ORDERS RESPECTFULLY SOLICITED.

**SIMPLY AN
ANNOUNCEMENT
CHRYSANTHEMUMS.**

Reprint from the last issue of the Journal of Horticulture:
"Whatever plants Messrs. Cannell & Sons take in hand are
certain to be grown extensively and well. Not a few scores or
hundreds, but thousands are needed to make a display propo-
riate to the requirements of the establishment. So it is with
the Chrysanthemums; 6000 plants are grown for the annual
show in the Swanley Nursery, and to these are appropriated
four span houses, 100 feet long each and 25 feet wide."

Mr. W. L. TOBIN, H. S. PRINCE EDWARD OF Saxe-Weimar
Dresden, October 29, 1886.
"I have to inform you that H.S.H. the Princess of Saxe
Weimar is much pleased with the Chrysanthemums you sent—in
fact, they cannot have too much praise."

**Dr. SCHOMBURGER, Botanic Gardens, Adelaide, South
Australia, February 12, 1886.**
"Dear Sir,—The plants arrived in splendid condition, and
gave every satisfaction; not one has perished."

Mr. A. BALMER, Waterlooville, New York, U.S.A., June 18.
"Four boxes of Chrysanthemums to hand in grand condition.
For packing plants for mail you take the lead; accept my
heartiest thanks."

W. H. COLLINGFORD, Esq., Seaford, March 24, 1886.
"The Chrysanthemums I requested you to forward to Mr.
Adam Forsyth, of Chatham, New Zealand, all arrived in good
condition. This has given me great pleasure."

F. N. GRIFFITHS, Esq., Ranigiri, Nilgiri, India,
January 12, 1886.

"A line to tell you that the Chrysanthemums you sent me
arrived on the 9th inst., all in excellent condition, and made
growth on the journey. The packing was simply perfect."

H. CANNELL & SONS.

Admission Free to Patrons of the Establishment, or on Presentation of Card.

**NEW PEA.
SHARPE'S QUEEN.**

OUR NEW PEA — QUEEN —
surpasses everything we have ever had the
pleasure of submitting to our Customers, in habit,
cropping qualities, colour and flavour; it is the perfection
of a Pea for every purpose, and, by successive sowings,
so continuous a crop can be obtained, that it will be
almost unnecessary to cultivate any other variety.

The QUEEN is a Blue Wrinkled Marrow Pea, about
2 to 2½ feet in height, of a sturdy branching habit; it
requires to be sown thinly, as the pods are produced
from the very bottom of the plant to the top. The pods
are large, green, slightly curved, and so filled with Peas
that when opened it would appear impossible they
could be contained in the pod. The Peas are large,
oval, deep-green, and of a delicious flavour when cooked.
We feel we cannot say too much in its praise, and are
confident our Customers will agree with us, it is the
very best Pea ever sent out.

Price, 2/- per Half-pint, Sealed Packets.

BARR'S BEAUTIFUL HARDY DAFFODILS.

BARR & SON, 12, King St., Covent Garden, W.C.

Illustrated CATALOGUE of DAFFODILS from an application.

GENERAL RULE CATALOGUE—Bulls for all seasons—free on application.

BARR'S NEW or RARE HARDY DAFFODILS

for Pot Culture, Flower Beds, Borders, &; for Descriptive List of Varieties, see Advertisement. "The GARDENERS' CHRONICLE," October 30; or send for B & S's Illustrated DAFFODIL CATALOGUE, free on application

These beautiful New Daffodils surpass all other spring flowers, whether for in or outdoor decoration, and as cut flowers they vie with the Orchid and the Rose. In the London Spring Flower Shows for twenty years Barr's Daffodils have occupied a leading position, and are now the most favoured flowers of spring

Barr's inexpensive Hardy Daffodils.

These surpass in beauty and effect all other spring flowers for Beds, Masses in Flower Borders, Shrubberies, and to Naturalise in Grass, beside Streams, Lakes, Ponds, or for Pot Culture. As a Cut Flower the Daffodil is prized beyond all others. Its culture is simple, growing in all soils and all situations; no amount of frost will injure bulb or flower. Grow three in a pot, they should be treated like the Hyacinth; or if forced for cut flowers, plant in common boxes about 9 by 15 inches and 4 inches deep; the bulbs planted close together, the boxes or pots placed out-of-doors and covered with ashes or Cocoa-ibre, and there left till the top of the bulb has grown about an inch. The boxes may then be placed under glass as required. A warm moist atmosphere ensures the best results, but an unheated greenhouse might be kept gay with these charming flowers from January to May.

Per 100. Per doz. s. d. s. d.

Table listing various daffodil varieties such as CHOICE MIXED DAFFODILS, FINE MIXED DAFFODILS, GREAT NONSUCH DAFFODILS, LENT LILIES OF ENGLAND, and GARLAND LILIES OF SCOTLAND, with prices per 100 and per dozen.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 6, 1886.

NEWBURY AND NEIGHBOURHOOD.

BERKSHIRE is noted for other things besides its breed of pigs. It contains many famous gardening establishments and places of historic interest. Local records tell us that few of the stately residences built by the merchant princes of Elizabethan days are more characteristic than Shaw House, Newbury. Built by Thomas Dolman, the friend and business associate of the famous "Jack of Newbury," and his son, Sir Thomas Dolman, it is said to have cost the enormous sum (for those days) of £10,000, being more than 1000 in excess of that of Hatfield, one of the handsomest examples of the Elizabethan style. Shaw House exhibits many of the peculiar features of this most picturesque style. It is of red brick, with window casings and enrichments of stone.

The house stands at the end of a pleasantly winding avenue of Limes—a leafy grove—in the midst of gardens and terraces, demurely planted with Hollies, Yews, and other evergreens. The eastern front, which faces the avenue, is, however, by no means the most picturesque. The opposite front, which looks out upon one of the prettiest of lawns—a fine stretch of verdant sward, bounded by a little stream dotted with Water Lilies—is, for pictorial effect, much to be preferred. The house is built, after the fashion of the time, in the shape of the letter E. It is notable for having stood a siege by the Parliamentarians—the marks of the siege being still visible on the walls. The building seems, however, to have sustained slight damage from the besiegers, which is no doubt accounted for by the great strength of the outer walls, which are mainly 6 feet thick. The present lawn-tennis ground was pointed out as being the spot where took place one of the deadliest conflicts during the siege, and it is likely enough that the bones of many a combatant lie beneath the turf where now all the talk is of "service" and "vantage." Such is fame!

Turning to the garden proper, this is kept in good order, there being a nice range of glasshouses. Fuchsias are especially well cared for—much better, in fact, than we are accustomed to see them in metropolitan shows. In the establishment under notice, for instance, we saw good examples of culture—examples some 10 feet in height, from last years' cuttings, pyramidally trained, three especially noteworthy varieties being Pink Perfection, Flocon de Neige, and Crown Prince of Prussia. A fine strain of Cinerarias (Van Houtte's) bearing wonderfully healthy foliage, was noted. Mr. Davis, the gardener, informed us that though not bearing flowers so "shapely" as some of the strains now in cultivation, yet it is an exceedingly useful and showy selection.

A fernery planted quite in the natural style, and therefore very effective, is a feature, forming quite a cool retreat.

Orchids are being taken up, a collection must

received from India looking well, and promise attractions and interest when fully established. The autumn queen of flowers (*Chrysanthemums*), judging by the number of plants one saw in good health, finds a congenial home here. A mixed house, furnished with choice little plants—Crotons, Ferns, Palms, &c.—was very showy, *Adiantum Farleyense* being especially prominent.

Fruit and vegetables, as might be expected in such an establishment, were not neglected, the houses devoted to Peaches and Grapes having borne good crops. Amongst the latter the good old Black Hamburg is deservedly held in esteem.

In an effectively planted outside mixed border we were pleased to see a mass, well flowered, of the now so seldom seen blue-flowered *Verbena venosa*—how effective when *en masse*, as here, and making a capital edging plant. A Fig planted on a wall outside was noteworthy as having borne a very full crop this year—the wall was quite clothed with its noble foliage—unfortunately we were unable to gather the name of the particular variety.

Quitting this interesting and historic spot a pleasant drive brings us to Welford Park, the residence of G. B. Eyre, Esq., and whereto one who is well known in the horticultural world—Mr. C. Ross—is director of affairs horticultural. The park contains many fine examples of tree growth, Silver Firs being especially noticeable; A. Pinsapo, a noble specimen, some 50 feet in height and well furnished. *Abies canadensis* (the Hemlock Spruce) was noted as coming very freely this year. A fine herd of deer gamboling about the park impart an air of picturesqueness and life to the place. The river Lambourne runs through a portion of the grounds. A pretty rustic bridge erected here is a favourite spot for trout fishing, permission being kindly given by Mr. Eyre occasionally to those anxious to engage in this quiet and interesting pastime.

Passing to the gardens, which are kept in admirable order, we notice in the plant-houses some good specimens of stove and greenhouse plants, Ferns being especially well done. *Platycerium alcionae* was represented by a vigorous specimen, with a spread of fronds some 15 or 16 feet in circumference. Here, too, was the curious and somewhat new *Alocasia Sanderiana*, a bold and distinct foliage plant, very striking with its broad, sagittate, dark shining green leaves, over a foot in length. A. metallic and A. Lowii were also in good form.

Touching fruits, Apples have long been a speciality at Welford, and what a grand crop the hardy bush trees are producing this year! Stirling Castle was a picture of fruitfulness, the branches literally breaking down with the fine fruits. The same remarks also apply to Lane's Prince Albert, Ecklinville Seedling, Keswick Codlin, and a host of other fine sorts. The kitchen garden, where most of these Apples are grown, has been over 200 years in cultivation. The subsoil is gravelly; the trees are "top-dressed" about every two years with fresh loam and old manure.

Black Currants thrive admirably in what is known as the "Canal Garden"—planted some fifty-four years, and the bushes producing good crops annually—Mr. Ross attributing their well-doing to the cool bottom on which they are planted.

Pines—as the late exhibition at the Crystal Palace amply testified—are well done here. One or two little cultural points here may not be out of place. The soil in which the Pines are grown is very fibrous loam, with the greater part of the soil knocked out of it, and mixed with bones broken up; the bones are very old, having probably lain in the ground 100 years or more. The largest pots used are 12 inches; most of them are only 11 inches in diameter. The pit in which they are grown holds only forty-eight plants, but by keeping it filled up as

the fruit are cut, about seventy fruit are cut every year. On September 14 last was cut a noble fruit of Smooth Cayenne—probably the heaviest on record, its weight being 10 lb. 12 oz.

What might be called a phenomenon in the vegetable department was seen—this being amongst the Potatoes, where Mr. Ross has done some good work. A single seed out of the berry was sown in heat on March 19 last; the seedling was pricked out April 16; gradually hardened, and planted out May 20; lifted September 8, when it was found to have produced 135 tubers. Weight 3 lb. 11 oz. It may be mentioned that the Potato which produced this wonderful crop from seed this year was got from one of Mr. Ross' seedlings, named The Pet, a seedling of 1884, from Sim's Life guard.

In the same lot of seedlings, of which there are about sixty; three of them did not produce a single tuber, only great bunches of fibrous roots, one had only three small tubers, and the others would average about twenty tubers each, of all colours and shapes.

A few miles from here are some famous Raspberry grounds, in the village of Inkpen, within two miles of the Coombe Hills and the celebrated Inkpen Beacon. Inkpen was in bygone days a place of considerable prosperity. It boasted of pottery works, and it is also said that blanket mills once flourished there, but these are now "things of the past." Its present claim to distinction in the horticultural world is that it is the birthplace of a fine very free fruiting Raspberry, named Earl Beaconsfield, and raised by Mr. Faulknor in 1876, sent out two seasons ago. About 3 acres of sandy soil in the picturesque hollow off the high road are now covered with long rows—"battalions"—of the canes in vigorous health; and such canes—9 to 10 feet in height, and as thick as good sized walking sticks.

The crop this year has been a heavy one; the quantity of fruit may be estimated at many tons, about twenty people being engaged daily during the "picking season," when the fruit was transmitted to various populous centres.

A seedling Cob-nut, which also promises to be a good thing, was noted. It is large and of good flavour, and will, doubtless, be heard more of. B.

New Garden Plants.

MASDEVALLIA ASTUTA, n. sp.*

ONCE more a member of the Saccellibata group. This comes from Costa Rica, where it was collected by Mr. Carder, and grown by Messrs. Shuttleworth & Carder.

As a species it is the nearest neighbour of the nice *Masdevallia Gaskelliana*, but this has distinct acuminate leaves, different colours, and a very distinct lip. Then it recalls *Masdevallia erythrocheta*, a Costa Rican species of this affinity, but that has long, narrow, acuminate leaves, and both lip and column distinct, and the bodies of the sepals rounder.

Our plant has leaves nearly a span long, petiolate, oblong-acute, nearly an inch broad at its widest part. Peduncle of the same length. The sepals are most distinctly triangular, with brown tails, surpassing the length of the rest of the sepal at least twice, simply brown, and yellow at the apex and centre outside, ochre-coloured, with numerous brown blotches inside, hispid there all over. Petals rather blunt. Anterior

* *Masdevallia (Saccellibata) astuta*, n. sp. — Affinis *Masdevallia Gaskelliana*. Folio spatulato petiolato ligulato acuto, dorso carinato; pedunculo subaequalibus unifloris; sepalis triangularibus intus hispidis, setis subduplo longioribus; tepalibus obtusis, laterali epichilio oblongo, carinis longitudinalibus teretibus, trabeculis lateroalibus pluribus divaricatis, limbo denticulato; columna dorso ligulata ligula apice retuso serrata. Flor. magistraliter albis *Masdevallia Gaskelliana*, extus brunneo, apice ac per coram ochraceis, intus brunneo guttatis striatove supra planum ochraceum. Labellum, tepala et columna flavoalba. COSTA RICA. H. G. Rolfe, f.

saccate part of the lip ascending at the top, toothed at the sides, with three longitudinal keels, and numerous small transverse bars outside the column, with a long beak. H. G. Rolfe, f.

ODONTOGLOSSUM ASPERSUM VIOLACEUM, Rolfe, f.

A very fine flower of this has appeared with Messrs. Shuttleworth & Carder. I am informed by Mr. Edward Shuttleworth that the petals and the lip were yellow when the flower first opened. They commenced to assume a mauve-purple colour the second day. I only had the flower after seven weeks, when it was said to have lost some of its brilliancy. I found it brilliant enough. It has the lip deep mauve-purple, with the callus light sulphur-coloured, with a few dark stripes on the inner surface. The petals have their disc or light ochre sulphur-coloured with a broad margin of light mauve-purple around. It is very interesting to see reappear nearly the same variety that flowered in March, 1881, at Sir Trevor Lawrence's wonderful emporium of Orchids. H. G. Rolfe, f.

ERIA FORDII, Rolfe, n. sp.

A remarkable species of *Eria*, belonging to the small section *Xiphosia*, is now flowering at Kew, where it was discovered from Mr. C. Ford, Superintendent of the Hoong Kong Botanic Garden. As it seems to be quite new I propose to name it after Mr. Ford, to whom Kew is indebted for numerous Orchids, both living and in a dried state. Hoong Kong has already furnished two species of the genus, neither of them known from elsewhere, one of which belongs to the same section as our new plant, namely, *E. rosea*, Lindl. When Lindley described *E. rosea* in the *Botanical Register*, t. 978, he spoke of the strongly keeled sepals as distinguishing it from all others. Then Griffith described a new genus which he called *Xiphosia*, relying mainly on this very character, and calling his plant *X. carinatum*. Lindley, however, reduced it to a section of *Eria*, including four species, and remarking that it only differed from the section *Dendrolirium* by the glabrous (not woolly) flowers. Denham amalgamated the two sections, doubtless owing to Lindley's statement, and the question now is whether the section can be retained. I would answer in the affirmative, as two of Lindley's four species differ in habit and in the total absence of keels, and only agree in having glabrous flowers. The section *Xiphosium*, then, excluding *E. scabriliguis* and *E. vittata*, Lindl., is characterised by a strongly trigonous ovary and sharply keeled sepals. It contains three species—*E. carinata*, Gibson, from Khasia; *E. rosea*, Lindl., from Hoong Kong; and the present species, which may be characterised as follows:—Pseudobulbus ovoid, slightly compressed, smooth, 2 inches long; leaf coriaceous, linear-lanceolate, acute, base attenuate, 8–9 by 1½ inches; racemes terminal on the young growths, 2–3 flowered, scarcely equaling the leaves; flowers equaling the bracts in length; bracts lanceolate, acute, sharply keeled above, less so towards the base, 1½ inch long, light green in colour; ovary sharply three-keeled, the two lateral ones narrowly winged and undulate; sepals lanceolate, acute, 1 inch long, concave inside, strongly keeled outside, the lateral pair being narrowly winged above, with about eight minute teeth near the apex; petals ovate-lanceolate, subsacate; lip linear-oblong, obtuse, and apiculate, 10 by 4½ lines, with three blunt keels on the lower half, the central one extending almost to the apex, the lateral lobes small and rounded; column with two short wings above colour of sepals, petals, and column light yellowish-green, the sepals with a varnished appearance; lip deep dull yellow above, dull flesh-coloured below, with dull crimson veins on side lobes, and less distinctly so at base of central lobe. From *E. rosea*, Lindl., it is readily distinguished by the flowers being a third larger than in that species by the coloured and some other details, while *E. carinata*, Gibson, has narrower bracts, longer pseudobulbus, and differences in floral details, besides the different area. R. A. Rolfe, Kew.

Jerusalem Artichokes.—This season, as is so many warm summers, a few specimens of this plant may be seen in bloom. It seed could be obtained it would be desirable to see if something could not be done to improve, or at least to select some improved form of this neglected vegetable. As it is one of the hardiest and most easily grown of plants this might readily be done.

CORDYLINE AUSTRALIS.

THE fine specimen of this plant of which our illustration (fig. 114) gives a good idea, is growing at Erich Bank, Kilm, Greenock, the residence of Wm. F. Burnley, Esq. The specimen stands on the lawn immediately in front of the mansion. It was planted in 1865, and has now attained a height of 18 feet; the circumference at the base is 3 feet, the top is sur-

mild character of the climate, that planted against a south wall a strong healthy plant of *Lapageria rosea* flowers freely every year and makes fine growths.

LILIES.

In a note on our Lilies written in July (p. 19), I proposed adding a few particulars later in the season,

since 1881, one had eight and another seven flowers. This is a truly gorgeous Lily, with its broad spike of crimson, but after some days, while the flower seems still fresh, the crimson turns into a dull stale claret colour, and then most of the beauty is gone. The next finest of the family is *L. auratum platypetalum*, of which there appear to be two varieties, the one variety known as *L. auratum macranthum*, being low growing; the first *L. a. platypetalum* exhibited were

FIG. 114.—CORDYLINE AUSTRALIS AT ERICHT BANK, GREENOCK.

mounted with three strong crowns, and there are four offshoots on the stem, as will be seen from the woodcut. One of the crowns sent up a flower-stem last summer, and another promised to do so this season. It has had no protection whatever during the winter months, and although the west coast is known to have a milder climate than most parts of Scotland, Mr. Hepburn, the head gardener at Erich Bank, informs us that last winter 17° of frost were registered frequently. [See Hook. f. in *Gard. Chron.* 1860, and in *Bot. Mag.* tab. 5636.] It may be mentioned, as showing the usually

Lilies in the open may be considered over for the year, as only a few chance ones remain in flower. I will begin with what is usually considered the Queen of Lilies, *Lilium auratum*, though some good judges consider *L. speciosum rubrum* in its best form, and others *L. candidum simplex* to have at least equal right to the title. *L. auratum* has on the whole succeeded well with us this season, though some beds were more cut than usual by spring frosts. *L. auratum rubrivittatum* was finer than we ever had it before; among our few plants which have been in the open border

almost without spots, like *L. a. virginale*, but the species includes all varieties of colour up to pictum. Two small clumps of *L. a. macranthum*, were most beautiful, and were much admired; a petal from one of these measured 3½ inches in breadth. The bulbs should be planted wide enough apart to prevent their knocking against one another in high winds, ours were not so. Our two finest of the ordinary *L. auratum* both bloomed in the wood at the Weybridge Cottage garden; one seemed to dwarf all the flowers about it. One of the petals measured wac 7½ inches

long, it was therefore 15 inches across the flower. In another bed one grew to 9½ feet in height, and yet was so well proportioned that it looked neither drawn up nor gawky.

L. pardalinum and *L. californicum* were cut by spring frosts in some beds and bloomed well in others a few yards off, where the frost-wind had not reached them.

L. speciosum rubrum and *L. album* were very fine, and so were *L. Leichtlinii* and *L. longiflorum albomarginatum*, or, as I suppose it ought to be called, *L. longiflorum foliis albo marginatis*.

L. Szovizianum in good soil always does well.

L. Hansoni was moderately good.

L. Kramerii was fine and seeded freely.

L. giganteum bloomed well but was not very tall. *L. cordifolium*, the Japanese dwarf form of *gigantum* (?), was cut down by spring frosts in our Wisley Wood, as it was not sheltered from the sun which came after them. In the orchard-house at Weybridge, in a pot, it had eight good flowers on a stem.

L. longiflorum, bloomed well in some places, best in shelter, but failed in others.

L. chalcedonico, did not bloom well, but the bulbs are strong and healthy; they were in full sun. I have removed them into a sheltered place.

All the *L. Martagonis*, to bloom well, and *L. superbum*. The question as to the relative merits of full sun, of shade and shelter, in Lilies, especially *L. auratum*, crops up from time to time, in the different gardening papers; it is not an easy one to solve. *L. auratum* often blooms thoroughly well in complete shade and also in full sun. *Rhododendron* beds, as I have often before said, are the cosiest places to grow it in, and the question of the necessity of sun to ripen the bulbs is settled by my friend Mr. McIntosh's Lilies, which themselves or their children have thriven for more than a dozen years in the full shade of his *Rhododendrons*. I believe two great points to aim at are to prevent the bulbs getting too wet or the roots too dry, and especially to keep clear of many tree roots which dry the soil as well as exhaust it. *Rhododendrons* keep their roots, to themselves, and do not interfere with the Lilies unless indeed they are grown very strong and very close.

In our little field of *L. auratum* in full sun, though with some shelter from wind by hedges, many hundreds bloomed well, some not more than a foot high, with stems not thicker than tobacco-pipes, had two fine flowers, many had one. I have made no mention of Tiger Lilies; they always bloom well. I do not think the species without stem-bulbs, *L. tigrinum jucundum*, is sufficiently known and grown; it is a beautiful form for cutting. *George F. Wilson, Heatherbank, Wisley.*

HIBBERD'S EMERALD IVY.

THE letter of "A. F. B." (p. 535) conveys to me the welcome intelligence that my favourite amongst the green Ivies is appreciated beyond the bounds of my own garden. Your correspondent declares—apparently with joy, certainly with truth—that it is "one of the best Ivies grown." I go beyond him, and say it is *the* best; but the difference raises a nice point that need not be fought out now. Permit me to thank "A. F. B." for the very first good word that has been spoken for my pet save by myself alone, and as I have never sold a plant I may with some propriety praise it. If "A. F. B." should ever quit the fertile grounds of Sarnia, and could call on me at Kew, I would satisfy him, first, that he has made a good guess of the affinity of Hibberd's Emerald Ivy with the Guernsey Ivy; I would next demonstrate that they are not identical, for I have both growing here within a few yards of each other, and my old pet is so much better than the new pet of "A. F. B." that it may turn his head to behold the difference; finally, I will explain to him the secret of the affinity, for Hibberd's Emerald is a seedling of the Guernsey wilding, differing from it in more rapid growth, a better habit of holding to the wall, and a more happy disposition in the trying climate of London. The Guernsey Ivy does not like London, but Hibberd's Emerald has known no other climate save by the way in which we obtain our knowledge—by travelling.

Now as to the proposed *Hedera Helix* var. *sarniensis*. The common form of *H. Helix*, as known to all men, is abundant in Guernsey; but the Emerald Ivy is distinct from it. Yes, this belongs to a group of large-leaved Ivies in which we find the Irish, the Algerian, and certain sub-varieties that haunt mari-

time localities from the Canaries to Ireland. The classification of these will depend on the habit of the botanist. He who goes upon the narrow-gauge will make a species of the group with perhaps the so-called "hibernica" for the centre, or he may make as many species as he can find distinct forms. The broad-gauge man will regard these rich and robust island and coast Ivies as forms of *Helix* that have had the advantages of warmth and humidity through long ages, and have grown fat by good living. Observation of the delicate gradations of characters in Ivies compels me to be a broad-gauge man, and therefore I regard *Helix* and "hibernica" as "stocks," "strains," or "varieties" of the same species. I do hope "A. F. B." will see his *sarniensis* and my Emerald growing together, for they are established, and show all their proper characters as determined by circumstances that are precisely the same for both. The journey from Sarnia to Kew is an expensive affair, but any enthusiast in Ivies may draw upon me when the character of my favourite is at stake. *Shirley Hibberd, Kew.*

BOTANICAL RAMBLES IN SOUTH CHINA.

THESE rambles were confined to the islands and the mainland adjacent to Hong Kong. The configuration of the land here is bold and striking—steep granite hills rise abruptly from the sea and recede in sharp serrated peaks or undulating curves till their outlines melt into the hazy distance, their aspect generally being dreary and uninviting in the extreme. It is only in the deep ravines and around the picturesque villages that vegetation assumes an arborescent form. The natives that eke out a miserable existence in the malarial valleys by cultivating Rice have denuded nearly all the accessible hills of everything that is useful as fuel. On a few of the lower hills *Pinus sinensis* is cultivated for firewood; the trees are seldom allowed to attain dimensions suitable for building purposes. Near the villages we frequently find fine specimens of *Ficus retusa*, with trunks from 12 to 15 feet in circumference. These trees seem to be sacred in the eyes of the Celestials; under their shade we saw rude altars laden with offerings to the gods. These offerings consist of fragrant "joss" sticks, tiny cups of "sam shu," a kind of spirit distilled from Rice, and battered patches of scarlet paper covered with the distracting combination of strokes and dots that represent the written language of China. We also find tall trees of *Bischofia javanica*, *Banaba malaratica*, *Melia Azadirach*, *Cinnamomum Burmanni*, *Celtis chinensis*, and a few fruit trees, such as the *Litchæ* (*Nephelium Litchi*), the *Longan* (*Nephelium Longan*), the Chinese Mulberry (*Morus nigra*), and occasionally the Mango (*Mangifera indica*).

A CHINESE VILLAGE.

Of a Chinese village it may well be said that "distance lends enchantment to the view." At 500 yards' distance the rows of cottages with their roofs, their facings of scarlet paper on the door posts, their rural aspect, with squatting and posturing Celestials in the foreground, suggest comfort and pastoral simplicity, and blend consistently with the calm characteristics of oriental life. But a close view dispels the illusion and shakes the poetry completely out of the scene. Squalid and noisy urchins wrangle rudely round the door-steps, ancient dames and patriarchal sires, wrinkled, careworn, and hideous, exhibiting the ravages of time both on their shrunken faces and their scanty garments, squat and lounge around the unsavoury dwellings; ugly corpulent pigs and moulting poultry wallow in the mire, while many hungry curs—a few degrees removed from their progenitor the wolf—make the day hideous with their yapping, and warn the stranger to guard the tender parts of his calves with a botanical specimen of the Penang Lawyer. Open cesspools impregnate the air with an overpowering stench; still many of the villagers—particularly the young women and children—look so sleek and healthy that one would be disposed to think that the place was a veritable sanitarium. Wide stretches of Rice fields, sometimes terraced and irrigated with wonderful ingenuity, surround these quaint habitations. Here we see the ox toiling knee-deep through the plastic mud dragging a small toy-like plough or a short looted-harrow. The jolly ploughman is usually a woman—to use a *Hibernicism*; this lady struts with bare muddy limbs behind the beast of burden grasping the plough with one hand and constantly jerking and flourishing a short rope, which is connected with the animal's nose-ring, with the other; at the same

time she expostulates loudly at the ox, and, I am sorry to say, malgoss the poor brute and his long line of ancestors in language that is hardly lady-like. Standing lazily in the stagnant pools by the wayside we see the ungainly water buffalo of China—a great barrel-bodied brute with immense horns, with hardly a hair on his dull slate-coloured hide. This animal exhibits great terror at the sight of a foreigner, whom he evidently regards as something uncanny. The Chinese, no doubt, consider this brute instinctively creditable to the buffalo—do we not rejoice in the reputation of being "fan quai," *i.e.*, foreign devils?

One of the industries common in these villages is bean-curd making. This is called "Taw-fu" and is made from the small yellow beans of *Dalichos soja* and its varieties. The beans are dried in a shallow coacave iron pot; there is generally a range of perhaps a dozen of these pots set in brickwork with spaces underneath for the fire. The fuel used is dried grass. When the beans are dried they are smashed or ground; a certain quantity is then stirred up in water till a pale yellow liquid is formed; the pots are then filled with the liquid and heated with a gas fire. The bean curd maker feeds his fire very dexterously: he has a tongue made of Bamboo which he picks up a bunch of grass and projects it rapidly into the space under the pot, withdraws it again, but leaves a small portion which has been burnt off the bunch to keep up the heat; the burning bunch is then projected into the next space, and so on till the bunch of grass is exhausted. He regulates the different fires so that one pot is ready before the other. The "curd," as it is erroneously called by foreigners, is the scum that forms on the top like the cream in a milk basin. When the particles cohere sufficiently he runs a knife around the sides and down the middle to detach the skin which has now formed a membranous layer on the top, he then lifts out the two separate pieces, gives them a twist, which forms them into a flexible strip of skin-like substance, and hangs them over a Bamboo pole to dry. Thousands of these strips may be seen hanging in the sun like yellow ribbons on a clothes line. This is the cheese of the Chinaman, and forms an article of diet amongst the poorer classes chiefly, and is said to be rather nutritious. [Highly so.]

THE VEGETATION.

But to return to the vegetation of the scene. By the sea shore we find the pretty little *Statice chinensis* growing plentifully, where it is frequently submerged by the tide. In forcing our way inland the aggressive *Guilandina bonducella* contests the passage with its hook-shaped prickles. Then the thick hedges of *Pandanus odoratissimus* offer further resistance; when clear of these, the road, as roads go in China, is comparatively easy.

The weeds of the Rice fields are numerous but not very conspicuous; *Loelia affinis* and *Sagittaria cordifolia* are the most striking. In swamps we find dense clumps of an aquatic Fern, *Aerostichum aureum*, and numerous cyperaceous plants. The vegetables are sometimes extensively cultivated on the drier fields, notably the sweet Potato (*Batatas edulis*), *Colocasia odorata*, Onions, probably a variety of *Allium acanthonotum*, *Canavalia gladiata*, *Phaseolus* sp., *Labiab vulgaris*, *Hydrocotyle asiatica*, and a large variety of cucurbitaceous plants, such as *Momordica charantia*, *Citrullus vulgaris*, *Cucumis sativa*, *C. longa*, *C. Melo*, and its varieties. We also saw occasional patches of *Eleocharis tuberosa*, *Basella rubra*?, *Hibiscus esculentus*, *Dalichos soja*, *Convolvulus reptans*, *Arachis hypogæa*, and many forms of the Chili family, some of them very ornamental.

Away from the cultivated ground the dwarf indigenous vegetation becomes very interesting. *Gleichenia dichotoma* is everywhere abundant; this is the "bracken" of the East, spreading luxuriantly over the sheltered and exposed hills and valleys in the most persistent manner. The beautiful pink flowered rosaceous plant—*Rhodomyrtus tomentosa*—is also very plentiful, but is rarely found at a higher elevation than 1000 feet. The fruit of this plant has a very pleasant flavour, and when ripe is eagerly devoured by the Chinese urchins. Another very common plant, *Phyllanthus emblica*, bears round green fruit which has the taste and appearance of a green Gooseberry, and is also much eaten by the natives; some of the medical authorities in the colony are of opinion that this may in some cases be the cause of choleric diarrhoea and other stomach complaints among the Chinese during the hot season.

On rocky banks by the side of streams, and even in the fierce sun, the graceful *Davallia tenuifolia* and the bold *Blechnum orientale* grow in profusion. *Adiantum flabellulatum*, *Pteris semipinnata*, *P. crenata*, *P. serrulata*, and *Cheilanthes tenuifolia* are equally common, but affect a drier situation. In places where the bushes are dense and the situation moist *Lygodium scandens* and *L. japonicum* cover the trees with irregular curtain-like folds of pendent fronds, and form objects of indescribable grace and beauty. Large bushes of *Melastoma macropoda* glowing with large deep lilac blossoms, take a prominent place among the shrubby plants, and the rambling *Rosa sinica* makes the wayside gay with snow-white Roses. *Clematis Meyeniana*, *C. crassifolia*, *Lettsomia speciosa*, and several species of *Convolvulus* climb up or hang over the steep banks.

In one or two favoured spots on the lower levels we occasionally find that the natives have spared a clump of trees at some distance away from the villages. Here I have seen fine specimens of *Liquidambar formosana*. This tree is said to be one of the sources of Rose Maloes, a substance reputed to be identical with the liquid Storax of commerce. My coolies generally carried away leafy branches of this tree for medicinal purposes; they consider it good for poulticing boils and running sores. Here also the well-known Tallow-tree (*Silligium sebiferum*) grows to a considerable height, but I do not think the natives take the trouble to collect the seeds for the sake of the tallow with which they are covered; I have often questioned them on the subject, but none of them seemed to know anything about it.

The seeds yield a large proportion of the so-called tallow; 100 lb. of seeds, it is said, will yield 28 lb. of tallow, irrespective of the oil, which is obtained by pressing the albumen. Growing up these trees we frequently find *Rhaphidophora Peepia*, a very handsome creeping Aroid, which at a distance resembles the *Vaillia*. In one of these little groves I came across two fine old plants of *Mucuna macrobotrys*, a curious Leguminous plant, with gigantic clusters of pale cream-coloured flowers. A single flower is sometimes over 3 inches long, and some of the clusters were 17 inches long and over a foot across the shoulder; they hang like bunches of Grapes. The description of the pods of this, given in *Bentham's Flora Hongkongensis*, is undoubtedly derived from imperfect material. The pods are described as being 5 inches long; but on these plants many of them were over 2 feet long, brown, smoothly pilose, reticulate and undulate, not obliquely winged, as in the case of *M. Championii*, which they are said to resemble. It had twined its strong stems round a number of the surrounding trees, and was spreading far and wide over the lofty branches. I feel sure that if this grand creeper could be induced to grow in the conservatories at home it would be peally admired. *A. B. Westland, Botanic Garden, Hong Kong.*

(To be continued.)

TOBACCO CULTIVATION AND THE EXCISE.

MR. CHARLES SHARPE, of Sleaford, Lincolnshire, writes, in *Land and Water*, October 30:—

"Some in this country, myself among the number, have this season made experimental trials on a large scale, which fully demonstrate the possibility of producing in England, in quantity and quality equal to that produced by the majority of Tobacco-growing districts abroad, a good sound leaf, calculated for the manufacture of medium and high-class smoking Tobacco. The expenses of cultivating on a large scale cannot be accurately estimated at present, but it would appear to offer no difficulty in view of the return to be expected from the crop. From careful calculation of the result of my own crop this season, I estimate a good average yield would be—say, 1800 lb. to 2000 lb. per acre, worth 5*s.* to 7*s.* per pound (about 50 per acre), as experience and skill enabled us to secure better results from our labours. For some years we should have to feel our way, and the experiments to be made in the cultivation of the plant and the curing of the leaf would doubtless be productive of a considerable expenditure of time and money; then proper curing sheds would have to be erected, and other buildings as well—all of which would cost money and not be available for any other purpose. Now, if Tobacco cultivation is to be fostered and not driven out of this country, as has been the case with the cultivation of many other

crops, notably Chicory, Woad, and Flax, some consideration must be shown to the pioneers of this advance by the Government. The duty on Tobacco is very high, compared with the value of the leaf, and I would suggest that for the first four or five years all growers of Tobacco in the United Kingdom should not be interfered with by the Excise in any manner. This could not in that time seriously affect the revenue. If it did, or in any case, after the expiration of a time sufficient to solve the question, the matter might be considered, and a differential duty, as in the case of spirits, be imposed. An assurance of this kind from the Government as early as possible before the preparation of the land for next season's crop would cause a considerable impetus to this movement, as the cultivators would be free from the serious risk of growing a crop and erecting buildings for its preparation."

What the action of the Inland Revenue is likely to be remains uncertain. We should have thought the simplest plan would be to adopt some such plan as that under which the Malt Tax was levied, by licensing the curing places, and taxing the Tobacco when fit for consumption. This, however, will involve the removal of the present restriction upon the cultivation, under which the prohibitive duty of £300 an acre is levied. A report reaches us that an experimental crop, grown upon the Lincoln Corporation Sewage Farm, has been destroyed "by order of the Excise authorities," in consequence of the necessary permission not having been obtained.

The Rosery.

AUTUMN ROSE SHOWS.

IN the very remarkable papers which "D. T. F." has lately contributed to the *Gardeners' Chronicle* he has, amongst other strange notions, advocated some kind of treatment of Roses by which they are to be brought into flower, not forced, but retarded in some inscrutable way, so that they may be had at any time. Well, it will be a new era in gardening, and I suppose we may look for green Gooseberries in July and Strawberries in August. I confess his remarks on this part of the subject are beyond my comprehension, and he also seems to have mystified my friend "T. W. G.," but there is one thing of which he seems to be quite ignorant; he says, that the National Rose Society would do well to expend its energies and money in encouraging such shows. Now, in the first place, the Society has not at present any money to "fly kites" with; and then, secondly, it has already tried it and found it to be a miserable failure. Some four or five years ago, when the great International Show at Manchester was held in the latter part of August (the 28th, I think), Mr. Findlay, burning with his usual desire to make all his shows attractive, was enabled to get his committee to assent to our going there, and giving us substantial help for carrying out the plan. Well, we did so; an excellent schedule was arranged, and exhibits were courted. What was the result? A few Northern exhibitors were enabled to show, and one of the reports now before me says, "the attempt to hold a Rose show so late in the year met with fully as much success as might have been anticipated." When a qualifying sentence like that is used we know (as "A. II. K. E." says in one of his essays) pretty well what it means. I believe but one amateur exhibitor south of the Trent put in an appearance; and I do not think that any of the Southern growers for sale who exhibited were very much elated by the encomiums passed upon their Roses. But we do also see Roses in August at other places. I generally go into the West of England for one of the best provincial shows in the kingdom (Taunton). I did so this year, in the middle of August, which has been an exceptionally good season for autumn blooming. I saw

these stands exhibited by a few of our best growers, both amateur and professional, and I can only say that they were stands which in July would have been simply passed over, but which under the circumstances gained 1st and 2d prizes; many of them were utterly out of character, and it would have been impossible for any one to have recognised them. Still, you may get now and then in your Rose garden blooms that would not have disgraced a stand in July, but that is a very different thing to getting a box of twenty-four good ones, and until "D. T. F.'s" new patent is out I am afraid we must wait.

With regard to Tea Roses, I think the same writer has misunderstood my meaning with regard to the seedling Brier, and its effect on them. Formerly all dwarf Teas were grown on the Manetti, and for many of them it was too rampant, and started too early into growth; it thus forced the scion on with itself, the result being that they either succumbed to the early frosts or were overpowered by the stock. The introduction of the seedling Brier altered all that; it gave them a stock which was not so rampant as the Manetti, nor so early, and the result has been that many of the older varieties which were difficult to grow before are now comparatively easy to cultivate, but it is also to be noted that we have had introduced varieties of late years which seem to have a more vigorous constitution to start with, such Roses as *Etoile de Lyon*, *Madame Lambard*, *Innocente Pirola*, *Marie Van Houtte*, all have a constitution as vigorous as one could desire. In somewhat questioning my statement on this subject, "D. T. F." adduces *Lady Mary Fitzwilliam* as not bearing out my theory; but *Lady Mary Fitzwilliam* is not a Tea! I have several catalogues now before me; in some it is included amongst the hybrid perpetuals, in others amongst the hybrid Teas, but in not one of them is it included amongst the Teas; indeed, one can hardly understand how any one who had ever seen it growing could have thought it belonged to that class. It is of the same style of growth as *Baroness Rothschild*; and, although many people found it difficult to succeed with it, yet others, such as my friend, Mr. T. B. Haywood, of Reigate, gave it a better character. There is much capriciousness in Roses with regard to both climate and soil. We find the same in fruit. Take the Strawberry, for example. We see some variety lauded up to the skies; we try it, and find it to be a hideous failure. Let us not be inclined to dismiss the sort as a worthless one, but rather believe that our soil or climate does not suit it. How many varieties of Potatoes have I tried which have been recommended as a ball of flour which I have in my garden found to be close and waxy? Again I say, cast no doubt on the veracity and judgment of the person who has recommended it to you, but rather believe it was not at home; and so I am persuaded it is with Roses. How often have I heard rosarians talking together about different varieties. One praises a sort, "Oh! but," is the retort, "it is such a brute in growth." Immediately there is a cry out, "As vigorous as any Rose I have." I think that while there may be other causes for this, yet one is the idiosyncrasy of the variety in question. It may be thought that these are very insignificant things to take note when the wide range of horticulture is to be considered, but to many they are of interest, and anything that keeps alive the love of horticulture and tends to close observation must not be considered trivial. In his communication in the *Gardeners' Chronicle* of October 23 "D. T. F." plunges deeper into the mire. I leave "T. W. G." to settle with him, as he is well capable of doing, but cannot forbear replying to his remarks at the end of his letter, where he exhibits the most astounding ignorance of a Society of which he is a member, and whose reports he receives every year. He surely ought to know better than to say that the Society holds two big shows because they pay, for, as a matter of fact, it never receives one penny from the exhibitors, however successful they may be. He asks, What do subscribers pay their subscription for? Well, I think that they get pretty full value in the tickets they receive, the form which the *quid pro quo* generally takes in all societies. He asks why information is not given in the *Rosarian's Year Book* as to mildew, orange fungus, &c.? Why, all the subjects which he mentions have been discussed in the *Year Book*. He himself took part in the discussion on mildew, and is, I see by the prospectus, to do the same this year for Orange fungus! The Society has published a "Catalogue of Exhibition and Garden Roses, and Hybrids on their

Culture," and has spread information on various subjects connected with the Rose. He talks sneeringly of the "phalanx of judges." Is he aware that no more than three judges are allocated to any class, and that the "phalanx" is necessary simply because the whole work must be got over in an hour's time? Had the Society the whole morning at their disposal there would be no occasion for a "phalanx"! and if "D. T. F." would only try Rose showing for a season, and keep an honest debtor and creditor account of prizes and expenses, he would, I think, soon find out that his idea of men making a single penny by the most successful exhibiting is a gross illusion.

Wild Rose.

TRADE NOTICES.

NEW GLOXINIAS.

ACCOMPANYING THIS I send you a number of photographs of my new improved large-flowering Gloxinias, of which I shall offer seeds and plants to the trade in the course of next season. I wish to call your attention especially to the Salpiglossis-like veined variety. I forward also electro of two beautiful flowers of the new Gloxinias (fig. 115). These flowers are the results of the fertilization of the erect-flowering types of *G. crassifolia* and *G. hybrida*, and unite the habit of *G. crassifolia* with the freedom of flowering and the richness of colour of *G. hybrida*. I should have preferred to have sent you at the time of flowering 2 some blooms, so that you might have had a good idea of their beauty, if the transportation to so great a distance without injury were not so difficult of accomplishment. As the colouring and markings of the flowers can but faintly be shadowed forth in a photograph, I can refer to all the horticultural firms of this place that by my statements as to the brilliancy of the novelty are true. *F. C. Heinemann, Erfurt.*

JOHN LAING & CO.

The partnership heretofore existing between Mr. John Laing and Mr. J. R. Box has been dissolved by mutual consent. The business will in future be carried on by Mr. Laing and his two sons under the former name of John Laing & Co.

MR. LAXTON.

We understand that Mr. Laxton has decided to sell off the whole of his stock of seedling fruits, Roses, &c., raised by him at Girtford. The seedling Peas and Potatoes—the results of hundreds of experiments—will be disposed of privately. Mr. Laxton has been so careful an experimenter, has achieved so high a degree of practical success, and also contributed so much to physiological knowledge, that we can but regret the cessation of his labours, though we shall not be surprised to hear that Mr. Laxton has a "hand" in similar proceedings at Llangollen, at any rate the "Hand" at that place is about to pass into his tenancy.

MR. TURNER'S NURSERY, SLOUGH.

Some years ago, when the late Mr. Turner took the large field lying between the old nursery and the Great Western Railway, he was fortunate enough to hit upon a space of 14½ acres well adapted for fruit tree culture. A bed of deep fertile loam resting upon the gravel—land that grows Wheat to perfection—is just the soil to grow good fruit trees, and in it they make a clean vigorous growth without being too gross and sappy; plenty of fibrous roots are made, and trees are found to transplant well from it. At the present time the trees will repay inspection. The land is not cultivated so highly as is done by some who grow fruit trees on a large scale; but the quality of the trees is all that planters can well desire. They appear to come into bearing quickly also, judging from the size of some of the bush trees that were bearing fruit freely, and not only freely, but of excellent quality also; and though it has been thought by some that the prevailing depression has operated to restrict the planting of trained trees, yet they appear to be in constant demand, if the extent to which they are grown at Slough may be taken as affording reliable evidence to that effect. The fruit, like the home nursery, is kept in excellent order, and the foreman of this department has been in Mr. Turner's employment for the space of forty years. The late Mr. Charles Turner was as keen and well informed a pomologist as he was a florist.

Bush Apples are worked on the Paradise stock,

and, as a matter of course, they become saleable stock much more quickly than trained trees which are grown on the Crab. There is a very fine lot of standard Apples on the Crab stock on clean, straight stems five to six years of age.

Bush or pyramid Pears are all on the Quince stock, and it takes something like five years to grow into good trees fit for planting to come into bearing at once. Standard Pears are on the Pear stock, and the stems to be grafted are allowed to grow for two years before this operation takes place, and they make good heads in another three years.

Of the various stone fruits there are large breadths, dwarf-trained Peaches, Nectarines, and Apricots being very fine, six-year old trees being well-finished, and if transplanted at once would bear fruit next year. Apricots are not so much in demand as formerly, because not so much planted; they are chiefly worked on the Mussel stock. The principal Plums are grown as dwarf-trained trees, or as standards.

Large stools of Figs for layering can be seen; the principal varieties worked are Lee's Perpetual or Brown Turkey, which is in great demand; Negro Largo, Castle Kennedy, Brunswick, Marseilles, &c. The layers are laid down in June and July, and they are rooted sufficient to come off in October. Cherries worked upon the wild Cherry stock are not in so large demand as trained trees as they used to be, and standards are numerous.

Bush fruits are a prime feature also, Currants and Gooseberries being largely propagated. Cuttings of Currants are being put in now, and the trees are sold three years from cuttings. A considerable collection of the large Lancashire varieties is also grown, and there is an increasing demand for them.

Maiden Apples, Pears, Plums, Cherries, and Peaches and Nectarines of the finest kinds are here in large quantities. Maiden Apples worked in March have made a rare growth, and have strong well-ripened stems 5 and 6 feet in height, and this without the help of manure; the natural fertility of the soil is the only stimulant.

An old gardener once remarked that "it is always better to have a soil too light rather than a very wet one; for where it is found to be too adhesive after the roots of the tree have extended themselves in the border, a remedy for the soil cannot well be applied without damage;" therefore the nature of the soil should be considered at the time of planting. A heavy clay soil can be lightened by having road-dirt or burnt earth mixed with it—previous to planting, of course, and vegetable refuse can be added with advantage. On the other hand, if the soil be too light it can be improved by the addition of some of a stronger character—say a strong loam. Trees in a light soil are greatly helped by a good mulching of short manure during summer, and by occasional doses of liquid manure when bearing fruit. *R. D.*

THE CHRYSANTHEMUM SEASON.

The return of November has brought with it the ever-welcome Chrysanthemum, the first appearance of which was noted in the pretty display at South Kensington on Tuesday, October 26. We say this much advisedly, as since the advent of the summer, or early flowering varieties, the flower in some of its forms is hardly ever absent from gardens after June, and the flowering season can merely be said to culminate in November. Unlike the popular fancy for Dahlias of certain classes, the regard for the Chrysanthemum has known no waning, but in fact has considerably advanced of late, societies for the encouragement of its cultivation springing into existence in towns and rural districts. Apart from its value as a plant to enliven the greenhouse or conservatory in dull November, the late flowering kinds are certainly becoming favourites in the flower borders, and as floral coverings to dissightly walls, and especially in town gardens that usually have more than their share of ugly brick surroundings.

We shall soon be in the thick of the different Chrysanthemum contests of the South of England; and no doubt we shall have some fine novelties to chronicle amongst Japanese, incurved, Anemone-flowered or pompon kinds. It may be noted as a sign of the interest betrayed in the Chrysanthemum, that a new work on the culture of the flower has quite recently appeared from the pen of Mr. Molyneux, of Swanmore Park Gardens, Hampshire, than whom no more competent exponent could be found.

EXHIBITIONS AND MEETINGS.

The following are some of the more important Chrysanthemum shows that will take place during the present month, viz.:

- November 8 and 9—Surrey Chrysanthemum Society.
 - .. 8 to 10—Lambeth ditto.
 - .. 9—Royal Horticultural: Floral, Fruit, and Scientific Committees; and St. Neots Chrysanthemum Society.
 - .. 9 and 10—Kingston and Surbiton ditto; and Southampton Horticultural Society.
 - .. 10 and 11—Croydon ditto; National Chrysanthemum Society; and Bath Floral Fête.
 - .. 11—Hammersmith.
 - .. 11 and 12—Tunbridge Wells Chrysanthemum Society; Portsmouth ditto; Richmond Horticultural Society; Bury and West Suffolk ditto.
 - .. 12—Devon and Exeter Chrysanthemum Society.
 - .. 12 and 13—Huddersfield ditto; Reading ditto (two days); Canterbury Gardeners' Society; Lewisham District Floral Society; and Cheshunt Chrysanthemum Society.
 - .. 15 and 16—Sheffield and Hallamshire Gardeners Society.
 - .. 16 and 17—Putney Chrysanthemum Society; Southend ditto; Winchester Horticultural Society; Brighton Chrysanthemum Society; Watford ditto; Devizes ditto (two days); Teddington ditto; and Twickenham Horticultural Society.
 - .. 17—Caterham Chrysanthemum Society.
 - .. 17 and 18—Bristol ditto; Newport and County Horticultural Society; and Ascot and Sunninghill Chrysanthemum Society.
 - .. 17 to 19—York Society of Ancient Florists.
 - .. 18—Hitchin Chrysanthemum Show; Taunton Chrysanthemum Society; Clivick Horticultural Society; and Royal Horticultural Society of Ireland.
 - .. 18 and 19—Hull Chrysanthemum Society.
 - .. 19 and 20—Sheffield and West Riding ditto.
 - .. 20—Fusley Chrysanthemum Society; Ramsbottom Floral Society; and Kettering ditto.
 - .. 22 and 23—Leeds Chrysanthemum Society.
 - .. 23—Borough of Hanley ditto; and Oxford ditto.
 - .. 23 and 24—Manchester Botanical and Horticultural Society; and Liverpool Horticultural Association.
 - .. 24—National Chrysanthemum Society: Floral Committee, 1.30 P.M.
 - .. 24 and 25—Birmingham Chrysanthemum Society.
 - .. 25—Colchester and Essex Horticultural Society.
- December 1—Fadcaster Chrysanthemum Society.

THE INNER TEMPLE.

The usual annual arrangement of the Chrysanthemums in the small greenhouse by the Embankment affords the visitor a view of a great number of both the new and the best of the older varieties. It is always desirable to see and test the new candidates for popular favour, but whether it is owing to the unfavourable effect the heat and dryness of the air of August had on the buds, or to other causes, these new (and also the older) varieties do not approach in excellence the flowers seen in previous years. But before bearing witness against this year's flowers generally we shall await their appearance on the show tables at the National, Kingston, and other leading shows. What we had the pleasure of seeing at the Temple Gardens proves that the gardener—Mr. Newton—thoroughly understands the culture of the flower in mid-London, and has done the best possible under peculiar circumstances.

GOOD OLD SORTS.

We will note here those kinds that appeared in good form. In incurved flowers Beverly, still one of the finest white; Emily Dale, a pale primrose sport from Queen of England; Fingal, rose-violet; Formosa alba, a pretty French white, more than ordinarily incurved; Gloria Mundi, a small but pleasing tint of yellow; Jero of Stoke Newington, rose-pink; Jardin des Plantes, which every one knows as being a beautiful golden-yellow flower; Lord Derby, a dark purple; Mrs. G. Kundle, one of the most perfect white flowers we have; and Nil Desperandum.

Of Japan varieties we noted Bras Koung, emperybrouse of hue; Lakme, a variety with twisted florets of dark orange, with a pink tinge; Val d'Andore, and under its synonym Gaillardia, large, and of an orange-chestnut tint; the bright rose-coloured Bouquet Fait, with large half tubulate florets; J. H. Laing, a very bright primrose, with florets of great width; Madame Lacroix, a fine pure white flower; Miss Townsend, with thread florets of deep yellow; the crimson-maroon Triomphe du Nord, well reflexed and distinct; Le Roi, a brilliant red-chestnut, very showy; Mons. Harman Payne, a chestnut-brown changing to yellow in the centre—a flatish flower with pointed florets; M. Richard Laris, a flower large and full with florets white in the middle

of it, changing to mauve at the margin; the rich chestnut-coloured *Père Delaux* was good in some instances, as were *Gordon* and *Source d'Or*—a rich orange, and a flower of much regularity of outline. We must not omit that fine red-brown, flower *Souvenir d'Amsterdam*, several examples of which were observed.

FINSEURY PARK, N.

The usual annual display of *Chrysanthemum* is well worth a visit: the reputation of the Park for its shows of these useful and decorative flowers is sustained. Mr. Mardlin, who has charge of the plants, evidently thoroughly understands their requirements, and that he does produce good plants and fine flowers the large attendance of visitors amply testifies. The individual flowers, generally speaking, are large-sized, clean, and well shaped, and in all cases the colours are bright and clear. Perhaps the most—or, at all events, one of the most—attractive varieties for those people whose favour does not run in the direction of the incurved sorts, and who desire something distinct, is *Mons. Freeman*, a Japanese variety, with incurved tips to the petals, the colour being a delicate rose. The flower has a solid appearance, and is dwarf in habit. Among other noticeable varieties

Japanese variety is *Galathée*, rose tinged with violet, and is a grotesque flower, the florets being long and much twisted—very large.

A good incurved is *George Glenny*, a bright primrose, and well formed compact flower. Also *Golden George Glenny*, differing only in colour.

Other well known flowers include *Elaine*, *Emily Dale*, *Jeanne d'Arc*, *Mons. Tarin*, *Empress of India*, &c., which are all very well known and appreciated.

THE ALPINE GARDEN.

SAXIFRAGA FORTUNEI AND ITS ALLIES.

The Saxifrages of the "Diptera" section, only four of which are as yet known to botanists, are all natives of China and Japan, and include *Fortunei*, *cortusefolia*, *sarmentosa* or *japonica* of some gardens, and *cuscutaeformis*. The first three are in cultivation, but the last, which is figured in the *Botanical Cabinet*, t. 186, introduced by the Loddiges, and, if we mistake not, flowered at Oxford in 1861; the runners are said to resemble a *Cuscuta*, leaves nearly orbicular, flowers small, with the petals more regular than in any of the other species. We have never had the pleasure of seeing

division of the roots after flowering or by seed, which it sometimes ripens in open seasons. It first flowered in Mr. Standish's nursery, Bagshot, and is figured in the *Botanical Magazine*, t. 5379.

A plant figured in *Illustration Horticola*, 1864, t. 393, as *S. Fortunei* var. *tricolor*, and which we believe was procured from the above source, is only a variety of *sarmentosa*, and not *Fortunei*. No flowers are shown in the drawing, but the runners so peculiar to *S. sarmentosa*, as well as the very hispid leaves, are shown distinctly.

S. cortusefolia, which is of more recent introduction, having been sent out a few years ago by the Messrs. Veitch differs from the above in its smaller flowers, subreniform leaves, and triangular acute instead of obtuse lobes, and entire not crenated petals. It is a useful companion to the above, especially as it flowers with the other at a time when most of the good things are long past their best, and notably that they may be grown with ease even in a small garden with little or no attention after the plants are once established.

PRIMULA CAPITATA CRISPA.

A provisional name given to a plant now flowering in the new rock garden at Kew; a decided acquisi-

FIG. 115.—HEINEMANN'S NEW VARIETIES OF GLOXINIAS. (SEE P. 538.)

were—*Yellow Globe*, a very handsome flower in all respects but in colour like *White Globe*, from which it is a sport. The colour is pale yellow. *Queen of England* is well flowered at the Park, and is represented by several fine blooms of a very pale flesh colour (incurved).

Mandarin is a Japanese variety with tubular florets; its colour is a bronzy-yellow, produced by the red-brown streaks on a yellow ground, and it should be a great favourite; it is, moreover, a free flowerer. One of the newer flowers, and one of merit also, is *Mrs. Mardlin*, a hybrid pompon from President; it is red on white, and very distinct; it is yet to be seen how it will be appreciated. *Mons. J. H. Laing* should recommend itself to lovers of the peculiar on account of its colour, which is a strange mixture of yellow and pink or rose shading on a whitish ground, the tips white: the florets are flat, and the whole flower of a medium size. *Lakmé*, *Madame de Sévigné* (Japanese), rich cerise, and one of the best large flowers, being solid. *L'Adorable* is likely to become a favourite—yellow with red-brown centre (Japanese). *Dormillon* (Japanese), rich red with a tinge of violet, medium size; *L'Aube Matinale* (Japanese), terracotta on yellow—a fine medium-sized flower, yellow on the underside, florets slightly twisted; *Sœur Dorothée Souille*, free flowering *Aeone* Japanese, pink, darker underside; *Marguerite Marrouch*, a large flowered terracotta coloured variety, with a yellow reverse; *La France*—a Japanese, much resembling in colour the *Rose* of that name, medium size—is a very pretty flower. A very good tubular

it growing, and it may probably be lost altogether. A good division, which may be taken advantage of by growers, presents itself even in such a small section as the above—those having runners including *sarmentosa* and *cuscutaeformis*, those without runners including the other two; and it is to the last section that our attention is particularly directed at this late season, both of them having for the last fortnight or more eclipsed all other late flowering plants with which we are acquainted, *Fortunei* more especially, the flowers being much larger, and if anything more numerous than in the other. In *S. Fortunei* the leaves are generally distinctly cordate, dark green-coloured, and having but a few bristles on the upper surface. Underneath the bristles are more numerous, especially on the veins; lobes from 10 to 12, distinctly obtuse, with many small serratures, petioles rough from the scars of deciduous bristles, and broadening into a hollow clasping base; flowers very numerous, in loose panicles, white, the longer petal being sometimes bifid with serrated margins. This, as we have already said, is one of the best autumn flowering plants we possess for open-air culture. It is perfectly hardy, and seems to thrive best in half shady places, inclined to be moist than otherwise. Rich peat is a good medium, but we find it grows more robust, and produces more flowering stems in a stiffish half loam half peaty soil. Although it produces no runners it may be easily propagated by

tion, and one of the most distinct of this set we have yet seen. It seems to partake of the characters of both *capitata* and *denticulata* in such a way that the lower half is *capitata* and the upper *denticulata*; the leaves are in rosette form, thin textured, finely reticulated, and with a beautiful crisp margin; the flowers, however, which are in capitate heads, are deeper in colour than *denticulata*, and all looking up as in that species, and not at right angles with the scape, as is the case in the ordinary forms of *P. capitata*. Seedling plants of it have flowered more or less since the latter end of April, and as it appears to stand our moist winters better than any of the others from that region (the Himalayas), it is likely to be sought after by lovers of this class of plants. *D.*

ORIGANUM SIPYLEUM.

There seems to be frequent confusion between this species and *O. Tournortii*, in British gardens at least. If Sibthorp's figures in his *Flora Graeca* are to be relied upon, there need be no confusion between the two, unless they are more liable to variation in a cultivated state than is generally supposed. *O. Tournortii* is represented in vol. vi., 569, and exhibits stiff, very leafy, and slightly branched stems, terminated by an oblong solitary spike of flowers with the usual densely arranged imbricating bracts. *O. siphyleum*, on the other hand, as represented at fig. 570 of the same work, is dis-

tinctly characterised by a drooping or procumbent habit, with much branched stems and wiry branches terminated by solitary, gracefully nodding spikes of smaller size than those of *O. Tournefortii*. The radical suckers are villous or densely hairy, while the plant is altogether smoother upwards, with deeply glaucous leaves. This is the form commonly seen in cultivation, although frequently named *O. Tournefortii* in gardens. It proves hardy in all but the severest winters in the neighbourhood of London, and keeps up a lengthened display all through the autumn months. The rosy purple bracts enclosing the spicate flowers are highly ornamental in themselves, even after the corollas have long since dropped. Rather dry, sheltered nooks in the rock garden, with perfect exposure to sun and light, will grow this or any of the hardy perennial species of *Origanum* to perfection. The species under notice well merits cultivation in pots by those who have the convenience of a cool house to show it off with the best effect. The rootstock does not spread rapidly, but propagation is readily effected by the barren shoots that spring from the rootstock, even when the plant is in flower. Sandy soil under a handlight is the best medium. *J. F.*

FRUIT AND VEGETABLE CROP OF 1886.

THE ingathering of the season's crops must now be about completed everywhere, and a few remarks as to how far anticipations have been fulfilled, which were but in distant view and hanging in the balance on July 24, when reports from correspondents were seen, gleaned from all parts of the United Kingdom and Ireland, in the *Gardeners' Chronicle*. The season had been, as then reported, cold, and not less than from two to three weeks later than the average for the period. A very general wish being then expressed that the backward summer would be followed by a bright and warm autumn, thanks to a kind and merciful Providence the desired change came, and for this northern district especially not a day too soon. This increase of heat began early in August, and continued with little variation until October 15. Fruit on walls especially showed an early improvement, particularly on south aspects, getting full benefit of twelve hours' rain. Here Peaches and Apricots ripened perfectly; the former, although a little smaller than usual, were high coloured, and good flavoured. The latter were, however, quite equal in size to former seasons, being also clean and perfectly ripened fruit all over. Plums have yielded a large crop both on walls and standards; they have, however, been smaller than usual, owing, no doubt, to the cold summer and heavy crop.

The pear crop has been a light one, being also small and imperfectly ripened especially on walls of east and west aspects.

Apples, with the exception of two or three sorts, were all but a complete failure; plenty of blossom was produced in the spring, but weak and imperfect, and they failed to set, although the weather at the time was favourable and free from frost.

Strawberries were a good crop, but owing to a continuation of dry weather, all kinds of early sorts were soon over. Late kinds were also abundant and high flavoured. Raspberries also carried a good crop, but were soon over.

Gooseberries were only a moderate crop; several sorts which promised well earlier in the season, did not hold out, and from the dry weather fruit were soon over. Currants of all kinds were plentiful and good. Cherries dropped a good deal in the stoning period, and supplied but a moderate crop.

In the class of vegetables, the season has suited most kinds admirably; with frequent light showers and plenty of dew they have kept fresh and good well through the autumn. Potatoes have produced heavy crops everywhere in the North, and generally of excellent quality. This is now the second year that we have been free from *Peronospora infestans* on the foliage, while the root are as sound as ever they were previous to 1845—the first year of its appearance.

I have been examining the full and forward stages of fruit buds on most kinds of fruit, which are promising well for another year's crop, and having escaped early autumn frosts, foliage on early kinds are falling yellow and ripe. Heliotrope was only cut up on October 26 by 2" of frost.

Rainfall for the last nine months has been under average for each month, excepting in May, when it was

14 inch in excess. This is now the third dry year in succession. Depth of rain for the locality in the year is a little over 30 inches. *J. Webster, Gordon Castle Gardens, Aberdeenshire, October 29.*

ORCHIDS AT THE WOODLANDS.

TO the enthusiastic lover of Orchids, the collection of K. H. Measures, Esq., affords at any season of the year a rich treat, abounding as it does in good plants of all the finest species and varieties procurable, and cultivated in a perfect manner. As a consequence their flowers are produced in great profusion and have a vigour and beauty not often seen. This remark applies particularly to a fine specimen of *Vanda Sanderiana*, a grand plant and variety carrying two spikes of magnificent blooms. *Acridis Lawrencei* is flowering freely; this is also a handsome species with its long racemes of large brightly coloured flowers. The new *Cattleya Bowringiana* is a welcome distinct and lovely addition to our late autumn-blooming species, the colour being deep rose with a dark crimson labellum, and the plant very floriferous. The true autumn-flowering *Cattleya labiata*, var. *Pescatorei*, is just expanding its blossoms and will be in perfection for some time to come, as the plant is large and in robust health. The houses devoted to *Cypripediums*, are now a beautiful sight and promise a still greater display of bloom at a later date; there is a large number of *Cypripedium Spicerianum* and its var. *magnificum*, a great many of them carrying two flowers on a spike; this is probably owing to the strength and vigour of the plants. The new *Cypripedium Measurianum* is also showing bloom-buds. This is probably one of the handsomest of the hybrids, the parents being *C. villousum* and *C. venustum pardinum*; it is a very free grower, and an abundant bloomer, the greater part of the flower being old gold colour; of this variety Mr. Measures holds the entire stock. The new *Odontoglossum-house* lately erected is a success in every way, and may be taken as a model of what such structures should be, while the condition of the plants is the best evidence of its suitability. There are now in flower some handsome specimens of *Odontoglossum Inseleyi splendens*, of both light and dark varieties, and an enormous quantity of *Sophronites grandiflora*, *Oncidium varicosum*, and many other kinds, all being vigorous in growth and clean. The *Dendrobium* contains many gems, and in really good plants, such as *D. nobile nobiliss*, *D. nobile Cooksoni*, *D. Lezchianum*, and a large quantity of *D. Ainsworthii* and *D. Ainsworthii roseum*. The *Cattleyas* and *Laelias* are showing a great quantity of flower sheaths. A special favourite with Mr. Measures is the genus *Cymbidium*, and no collection probably contains such large specimens of the best and showiest species; but probably the most notable plant not in bloom is *Angreecum caudatum*, a picture of perfect health, and having eight large growths, with many long thick aerial roots—doubtless the best cultivated specimen, and probably the largest in this country; the pure white *Lycaste* and the charming *Vanda cerulea*, *Cymbidium Mastersi*, *Dendrobium Goldiei*, and many others, each and all lending their charms to a display which is quite exceptional for the time of year. I must not forget to mention that the owner's genial manner and cheery welcome adds much to the enjoyment to be found in an inspection of his fine and, in many instances, matchless specimens. *L. G.*

The Flower Garden.

DAHLIAS.

THESE plants are better cut over about 10 to 12 inches from the ground; after they have received one night's frost a little soil should be drawn round the stems to prevent injury reaching the crown, and it is better to let the tubers remain in the beds thus for a few days previous to lifting them. Choose a dry day for this operation, and use a piece of wire to fasten the names securely to each plant. Let the tubers be partially dried in a shed previous to storing them for the winter, and frequently examine them for the first few weeks, as they are more liable to decay then, than afterwards. They may be stored in any frost-proof

place. My usual place is underneath the potting bench, covered 6 inches deep with dryish soil. They will, however, stand the winter out-of-doors in the ground with protection from a heap of coal ashes, straw, leaves, or any other material of sufficient thickness to exclude frost. With a little extra care in the spring those so treated, will bloom considerably earlier than those struck from cuttings.

WINTER AND SPRING BEDS.

The various occupants of the flower beds should now be in their allotted places as soon as possible, if they are to do much good, as frosts and rain will rapidly cool the soil and bring root-action to a minimum. The present month is a very suitable one for the planting of all kinds of bulbs, but the sooner these are planted the better. In planting Crocuses it is a good preventative against damage by mice to well dust the bulbs with red lead. Where winter bedding is not carried out, and the empty beds are an eyesore, shoots of evergreens may be stuck in, such as Laurel, Holly, Box, *Rhododendron*, &c., or the beds may be dug, finishing them with a smooth margin about 4 inches wide; this has a neat effect, and more of the surface is exposed to the action of the atmosphere than in ordinary digging.

Much time will now have to be devoted to sweeping of lawns to rid them of leaves and wormcasts; a thorough watering with lime-water will bring worms to the surface, and a heavy roller passed over the surface will kill them. The exceptional mildness of the season has entailed much mowing, but now that growth has almost ceased, a close mowing should be given for the last time, which will facilitate the work of sweeping during the winter months when neatness is essentially necessary. *W. M. Baillie, Luton Hoop Gardens.*

THE ORCHID HOUSES.

VANDAS.

ALTHOUGH it may be natural for these plants to lose many of their bottom leaves, we always endeavour to give them a sort of treatment that will tend to retain them on the plants for as long a time as possible. No one will admire long leafless stems, and the handsomest specimens are those with foliage down to the pot. At the same time the leggy plants might be in good health, and perhaps bear the finest flower, because they may have been grown in light airy positions. To grow *Vanda tricolor*, *V. suavis*, and *V. insignis* so as to have the best appearance and flower freely, they require a temperature and treatment between that of the *Cattleya* and of the East Indian-houses. We have several standing on the central stage in the *Cattleya-house*, where *Laelia purpurata* does well. This place suits the *Vandas* best, during the cooler season as the atmosphere is moister, and they derive benefit from the warmth of a bed of Oak leaves that is placed under the stage. In summer the *Cattleya* treatment causes the *Vandas* to flower very freely which is antagonistic to their being kept well furnished with foliage. Those plants which have the best appearance here are grown in a small division at the north end of the *Cattleya-house*; here the atmosphere is quite as moist as that of an East Indian-house. The right temperature during winter is two or three degrees warmer than that of the *Cattleya-house*, and in summer with sun-heat it is generally lower than the *Cattleya-house* proper. *Vanda Deionisiana* grows very well in baskets with only a few crocks placed about the roots, the plants are suspended in the *Cattleya-house*, and they are watered often during the summer time, but not syringed overhead. *V. (Renaethera) Lowii*, *V. cerulea*, and *V. Estemani* grow best in the East India-house; but if the latter will not flower place it in a light position in the *Cattleya-house* for the summer months.

POTTING AND CUTTING DOWN

From the present time until February will be the safest season to repot or cut down any plants that require it. This is best done when the plants are active at the roots. Any that have lost many leaves and not yet thrown out roots from the bare stems high enough to bring them into shape when cut down should be placed in a warm moist atmosphere which will induce them to throw out roots freely. I have never gained much by trying moss round the stems,

Any one desirous of increasing the stock of any variety should not be in a hurry to cut their plants down, as they will push out breaks from the stem. These can be taken off when they have made sufficient roots to take care of themselves. Sometimes by leaving these on a noble plant is formed, providing the lead does not lose leaves too fast. Vandas delight in plenty of drainage. When potting use rather large crocks. These can be worked in with the sphagnum higher than the rim of the pot. Plants that appear too large for their pots and do not require lowering will receive the least check by picking out all the moss possible, and by filling in the space with new crocks, placing the pot inside a larger one, afterwards filling the space between them with plenty of drainage and sphagnum, turning in with them possible the points of outside roots. Very little water is necessary during winter, but just enough to keep the sphagnum alive. Plants that have been disturbed at the root should be damped about the pots and the stage when the air of the house gets at all dry.

CLEANING THE STOCK.

It will greatly improve the appearance of any collection of Orchids at this season to go through all the houses, taking the plants as they come, sponging the foliage, top-dressing any that require it, and washing the pots, stages, and roofs. Then rearrange the plants so that all may get an equal share of light, but avoid the practice of standing plants on the floor too long when the weather is cold. After the cleaning is done, should there be any doubt as to thrips being still on some of the plants, the warm houses should be fumigated—first brushing a little flowers of sulphur into the centre of any growths where thrip is likely to hide. We never make much preparation before fumigating, only to see that growing or tender plants are moist at the root and the foliage dry. After trying different kinds of fumigators, I find nothing safer for Orchids than several ordinary clay saucers, about 7 inches diameter, placed at equal distance on the walks, in number according to the size of the house; place two or three red-hot coals in each, and at the same time lay on a small handful of tobacco-paper, damp it a little on the top, and leave the material to burn out without further attention. C. Woolford, Devonside.

PLANTS AND THEIR CULTURE.

THE CONSERVATORY.

THE longer nights and damp weather of the autumn will call for constant attention in picking over the plants, else a great deal of bloom will be lost by decay; give air freely on favourable days. Camellias should have weak waterings of liquid manure to increase the size of the blooms, the best stimulant being soot water. In conservatories, as a rule, the borders are rarely fitted to grow well the subjects planted in them, and considerable attention is required to keep the plants in health and vigour. Orange trees, especially the Otaheite variety, will require careful watering, otherwise they will lose their rootlets and the plants will soon become sickly looking. Keep the house gay with Chrysanthemums, Arums, Salvias, Violets, Nigonoette, Cythus, Tuberoses, zonal Pelargoniums, Fuchsias, Bouvardias, and Cyclamens; these, with such things as Azaleas, Grevilleas, Palms, Ferns, and the very useful varieties of Amaranthus salicifolius and A. tricolor, which come in at this season. All climbing plants should be thinned out, with the exception of those that are in flower, viz., Habrothamum, Plumbago capensis, Lapagerias, red and white. By timely attention to this matter, the plants beneath the climbers suffer but little.

FORCING HOUSE.

This must be kept well filled with such plants as are required; a good quantity of Roman Hyacinths, Spiraees, Duc van Thol Tulips, Azaleas of the early flowering kinds, Musks, Violets, Eucharis, Tuberoses which were potted late, Schizostylis coccinea, which was potted early; Arums, a few established Lily of the Valley, Gardenias, and Tabernaemontana coronaria. Keep up a nice growing atmosphere in the house, and keep some of the troughs over the hot-water pipes filled with manure-water, so as to charge it with mild ammoniaical fumes, thereby greatly assisting the development of foliage and flower. When the plants have come nicely into bloom they should

be placed in a cooler and better ventilated house to stand there till required, otherwise they will not last in good condition for any length of time. The temperatures in the various houses for the ensuing fortnight should be kept as follows:—Stove, 68° night, 75° day; greenhouse, 55° night, 65° day; fernery, 55° night, 65° day; Rose, 60° night, 70° day; forcing, 65° night, 75° day; warm plant pits, 60° night, 70° day. A. Evans, Lytle's Hill, Haslemere.

FRUITS UNDER GLASS.

WINTERING STRAWBERRIES IN POTS.

THE time of year has now arrived when pot Strawberries should be put into their winter quarters. I may here remark in connection with this subject, that we should endeavour to imitate the most favourable conditions under which any plant is known to flourish in its natural state during its period of growth and rest in subjecting it to pot culture, it and more particularly as to the process of forcing. Hence it is that we always winter our stock of Strawberries in pots in their natural quarters cut-of-doors. Our method of procedure is as follows:—A series of short piles about 24 inches long are driven into the ground (a gravelled space free from the lodgment of water, and having a south or west aspect, which is set apart for this and other purposes), to which three 6-inch wide straight-edged boards are nailed, the size and number of frames thus made being determined by the number of plants to be wintered therein. A little sifted coal-ashes is then spread over the gravel and the pots plunged below the rims closely together in the same material, covering the surface of the balls of earth and roots with the ashes as the work is proceeded with, and in the event of severe weather, such as was experienced during the preceding winter, they are slightly covered with some dry Bracken. This, however, has been removed on every favourable opportunity, and vice versa; and notwithstanding the fact that the white-ashes, pots, and soil—were one frozen mass for weeks at a time, we found very few broken pots—not a score out of 3000—by the action of frost. Readers of the *Gardener's Chronicle*, who may not have the accommodation indicated, can, nevertheless, winter Strawberry plants satisfactorily, by placing a few inches thick of ashes on the surface of a dry border—that is to say, a border where water will not lodge at any time—and plunging the pots therein in the manner advised above, enclosing the whole by a bank of ashes to the level of that in which the pots are plunged; and where there is any difficulty experienced in the matter of dry borders, it may be removed by placing on the latter a few inches thick of clinkers, &c., to insure drainage before plunging the pots in the way recommended above. H. W. Ward, Longford Castle.

HARDY FRUIT GARDEN.

PLANTING, AND SORTS TO PLANT.

PRUNING, training, and planting, will now constitute the principal work in this department. Many planters of hardy fruit trees will now be making a choice of varieties, and selecting their trees. Whilst the latter should receive careful attention, the former subject—the choice of varieties—is undoubtedly of the greatest importance. It is interesting to have a good collection, say, for instance, of Pears or Apples, but the novelty of cultivating endless varieties soon wears off, and one often wishes the numbers were reduced, retaining the best and longest keepers. Keeping quality is of the greatest importance, as this decides in a great measure the intrinsic value of the fruit. How many grand Pears, for instance, come in season altogether, and possess but poor keeping qualities?—hence the major part of them is wasted, for even if they could be sold, buyers would be scarce. The following varieties of Pears and Apples are amongst the best, and will come into use in succession, and, when well grown, will meet with ready purchasers, and will give every satisfaction at the table:—Souvenir du Congrès, Williams' Bon Chrétien, Beurré d'Amanlis, Napoleon III., Windsor, Beurré Superfin, Fondante d'Automne, Beurré Hardy, Brown Beurré, Louise Bonne of Jersey, Urbaniste, Doyenné du Comice,

Marie Louise, Pitmaston Duches, Thompson's Napoleon, Glou Morceau, Deurré de Jonghe, Josephine de Malines, Beurré Rance, Easter Beurré, Olivier de Serres, and Van de Weyer Dales.

Steering Pears.—Cataliac, Léon le Clerc de Laval and Uvedale's St. Germain.

Desert Apples.—Irish Peach, Devonshire Quarrenden, O-lin, Duches of Oldenburg, Worcester Pearmain, Kerry Pippin, Yellow Ingestre, American Mother, Gravenstein, Cornish Anromatic, Harvey's Wiltshire Defiance, Scarlet Pearmain, Cox's Orange Pippin, Blenheim Orange, Lady Heniker, King of the Pippins, Court of Wick, Mannington's Pearmain, Ribston Pippin, Margil, Claygate Pearmain, Cobham, Braddick's Nonpareil, Adam's Pearmain, Pitmaston Nonpareil, Cornish Gilliflower, Court Pendu plat, Northern Spy, Cockle's Pippin, Nonpareil, and Sturmer Pippin.

Culinary Apples.—Lord Suffield, Stirling Castle, Nelson's Collin, Eckinville, Yorkshire Beauty, Dumelow's Seedling, Warner's King, Tower of Glamis, Bess Pool, Allington, Winter Pearmain, and Hambleton Deux Ans. These are, without doubt, twelve of the best all-round culinary Apples. G. H. Richards, Somerley, Kingswood.

The Kitchen Garden.

ASPARAGUS BEDS.

THESE should now be cleaned from weeds and put in order for the winter, first removing the stems of the Asparagus by cutting them off close to the ground; the soil should then be forked off low enough to expose the crowns of the plants, and a mulching of thoroughly rotten manure, to which salt has been added at the rate of 1 bushel to the ton, and placed evenly over the surface to the depth of from 2 to 3 inches, afterwards replacing the original soil. Each bed should be accurately defined by having a strong stake driven into the ground at all the corners, and from these the line should be stretched lengthways, and the sides, having been previously made firm and even, chopped down with the spade, the alleys raked, and the whole left smooth and even. Plants intended to be lifted for forcing should be allowed to remain as they are, simply covering the ground with a few inches of litter, to prevent it freezing. A pit or frame can be selected and prepared for forcing the above—one with sufficient heating capacity to maintain a bottom-heat of 80° and a top-heat of about 60° will be very suitable for the purpose; where bottom-heat from hot-water pipes is not available, fermenting material—a mixture of leaves and stable litter—should be prepared for the purpose beforehand. In preparing the bed for the reception of the clumps it should, if possible, be so constructed that when finally planted and finished the surface of the soil be within one foot of the glass.

RHUBARB AND SEAKALE.

Roots of these should be lifted and started for the earliest supplies; a steady bottom-heat, as for Asparagus, will be necessary, all light, however, in this instance being excluded. Where a portion of the Mushroom-house can be devoted to this purpose no place is more suitable. Both Rhubarb and Seakale can be planted thickly and firmly in fine soil, sufficient to cover all but the crowns, and if the soil be in a proper condition, as it should be—namely, in a moist and usable state—no water will be required until the young growths have started. To encourage and promote this a layer of from 6 to 8 inches of dry, sweet leaves should be placed over the surface of the crowns, and afterwards gradually removed at discretion. John Austen, Willey Court Gardens.

MARIGOLDS.—The distribution of colour in these flowers is worthy of note. In most forms ray and disc are alike of some shade of yellow, but in some the central disc is of a deep purple, contrasting well with the yellow rays. In the ray-florets the ray is really composed of three petals, united, as may easily be seen, by looking at the notches at the ends. In some cases the marginal portions of the ray—that is, the two outside petals—are deep orange, while the central one is light yellow. In other cases the colouring is precisely opposite. In a third set of cases, while the base of the ray is light, the other, or free end, is deep orange.

Appointments for the Ensuing Week.

SHOWS, &c.	
MONDAY, Nov. 8.	{ Surrey Chrysanthemum (two days). Lambeth do. (three days). Royal Horticultural Society: Meetings of the Scientific, Fruit, and Floral Committees, at South Kensington.
TUESDAY, Nov. 9.	{ Kingston and Surbiton Chrysanthemum Society (two days). St. Neots (Hants) do. Southampton Horticultural do. (two days).
WEDNESDAY, Nov. 10.	{ National Chrysanthemum Society, at the Royal Aquarium, Westminster (two days). Bath Chrysanthemum (two days). Croydon do. (two days). Richmond (Surrey) Horticultural Society Chrysanthemum Exhibition (two days).
THURSDAY, Nov. 11.	{ St. Peter, Hamersmith, do. Tunbridge Wells do. (two days). Portsmouth do. (two days). Bury and West Suffolk do. (two days). Huddersfield Chrysanthemum (two days). Reading do. (two days). Lewisham and District do. Devon and Exeter do. Canterbury Gardeners' Society do. (two days). Chesham do. (two days).

SALES.

MONDAY, Nov. 8.	{ Sale of Dutch Bulbs, Roses, &c., at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at Lambourne End, by Protheroe & Morris.
TUESDAY, Nov. 9.	{ Sale of Nursery Stock, at the Millford Nurseries, near Godalming, by Mr. Stevens (four days). Sale of Nursery Stock, at the Royal Ascot Nursery, by Protheroe & Morris (two days).
WEDNESDAY, Nov. 10.	{ Sale of Dutch Bulbs, Roses, &c., at Stevens' Rooms. Sale of Dutch Bulbs, Roses, &c., at Protheroe & Morris' Rooms. Sale of Imported and Established Orchids, at Stevens' Rooms.
THURSDAY, Nov. 11.	{ Sale of Nursery Stock, at the American Nurseries, Leytonstone, by Protheroe & Morris (two days). Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY, Nov. 12.	{ Sale of Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY, Nov. 13.	{ Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

IN announcing the decease, on the 20th ult., of the author of a *History of English Gardening*, we can hardly expect to evoke more than a passing feeling of sympathy from the majority of our readers. A new generation has sprung up since that work was published in 1829. The book itself is now scarce, and is probably only known to a few students and journalists. Fewer still knew or realised that the author was, till comparatively lately, the learned, firm, but genial co-editor of the *Journal of Horticulture* and the founder, in 1848, of the *Cottage Gardener*. This was the humble title by which the now well-known *Journal* was originally designated. Of late years, more particularly, Mr. GEORGE W. JOHNSON had, by reason of deafness and increasing infirmities, withdrawn into private life. He was seldom seen at meetings or societies, and in 1881 he retired altogether from the editorship of the *Journal*, leaving its management to his old friend and colleague, Dr. HOGG. Under the circumstances we have named, it is a simple act of justice to the memory of a laborious and conscientious worker to recall the services of the veteran, and give some expression to the gratitude which he has so amply earned at the hands of his successors.

For our own parts the *History of Gardening* forms the special thing for which we feel under an obligation to our late colleague. We do not,

of course, overlook his many other services to horticultural literature, his researches in chemistry, and their application to practical purposes; his *Dictionary of Gardening*, his charming biographical notices of horticultural worthies of the past which from time to time appeared in the *Journal*; but all of these, however well suited for their immediate purposes, were nevertheless ephemeral in their character. Not so with the *History of Gardening*. That is a book of permanent value, as is evidenced by the frequency with which we are obliged to have recourse to it. "To the general reader," says the author in his preface, "this work offers entertainment from its historical details; to the man of literature it affords notices of the authors on gardening, with statements of their various works and their editions; to the gardener, all of its contents possess some degree of interest, for besides being a record of his art in every age of which we have any history, it may serve as a guide to such authors as contain information on subjects relating to it, of which he may be in search."

The great value of the book from an historical point of view as supplying details, not only of the literature of gardening, but of the introduction of various flowers, fruits and vegetables, here so lightly touched on, renders it incumbent on others to say for him what the author could not say of himself. "The chief qualifications," he continues, "required of the author were diligence and care," and these undoubtedly must have been freely exercised. But more than these—appreciation and judgment—were necessary. Diligence and care are not uncommon qualities: hard workers are not rarities. The higher qualities of discrimination and proportion are much more rare, but they were not wanting to the author of the book we mention. Mr. JOHNSON'S book deals with the progress of horticulture from the earliest beginning up to the time of KNIGHT and DAVY. Any one who would bring out a new edition of this useful book and take up the thread where JOHNSON left it would not only be rearing a monument to the original author, but doing a work of great public utility.

For the details which follow we are indebted to the courtesy of the Editor of the *Journal of Horticulture*. GEORGE WILLIAM JOHNSON was born on November 5, 1802, at Blackheath. Together with his elder brother, CUTHBERT, well known as a writer on agricultural subjects, GEORGE devoted his attention to chemistry, and its practical application to agricultural purposes. Their father's salt works at Heybridge in Essex supplied both the incentive to research and the means for carrying it out. As early as 1826 Mr. JOHNSON began to write for the horticultural Press, and to *LOUDON'S Gardeners' Magazine* he, in 1827, contributed a series of papers on chemistry as applied to horticulture. Other literary work followed during the time the author was reading for the bar. After being "called" at Gray's Inn he proceeded to India, became a Professor in the Hindoo College of Calcutta. Here he did much journalistic work, including the editorship of the *Government Gazette*.

Mr. JOHNSON, however, only resided in India for a few years, and on his return to this country again turned his attention to gardening pursuits and horticultural literature. In 1848 he founded the *Cottage Gardener*, as above stated, and in 1851 he became associated as Editor and proprietor with Dr. HOGG, and the friendship and conjoint labours of these two men was, to those who knew the circumstances, one of the pleasantest episodes of the journalism of our time.

After eighty-four years of life, the long working period of which was so usefully and so honourably filled, GEORGE WILLIAM JOHNSON

was laid to his rest in the burial ground of St. Peter's, Croydon, on Thursday last.

FOR the next few weeks the CHRYSANTHEMUM growers will have it all their own way, and the Chrysanthemum exhibitors will be fired with zeal, to which there is nothing comparable save the enthusiasm of the Rose exhibitors. The Chrysanthemum lovers have ample ground for the faith that is in them. The range of colour is almost as great as in the case of the Dahlia, while the form (except in the incurved varieties) is much more beautiful and much more varied. The foliage is good also; but the special virtue is the production of flower in these dull November days, and the prolongation of the flowering by means of the showy Japanese varieties all through the winter. Chrysanthemums now-a-days may be had for half the year or more, and there is already a multitudinous race of summer-flowering varieties which, pretty as they are seen, so much surplusage. Indeed, the Chrysanthemum more than most flowers offers an example of what, Nature giving the lead, the gardeners can do in altering the character of flowers. It is not only that there are early varieties and late varieties, flowers of almost all hues except blue, but the whole shape and construction of the flower is altered. Flat rays give place to quills, and these to the extravagant shapes of the Dragon varieties and of those wherein it is hardly an exaggeration to say that the flower is turned inside out.

Again, they are the flowers of the million; they can be grown cheaply and well in the most unfavourable surroundings. The London suburbs have been famous for them for years, and even the benches of the Temple relieve the tedium of dry law by the refreshing brilliancy of the Chrysanthemum. The Chrysanthemum fairly deserves its popularity; notices of some fifty Chrysanthemum shows lie on our table, and these do not exhaust the list. Ealing and Highgate lead off, while, mindful of the proverb, *carpe diem*—seize the opportunity—Mr. MOLYNEUX has reprinted his useful series of papers on the cultivation of the Chrysanthemum, and to which we must allude at greater length on another occasion.

— HORTICULTURAL CONGRESS IN PARIS.—In May, 1887, a Congress will be held in Paris in connection with the Spring Exhibition of the National Horticultural Society of France.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. CUTLER, the Secretary of the above, desires to remind holders of collecting cards that the latter are due from them at a date not later than November 30.

— THE VINTAGE.—From advices from the Burgundy district we learn that the vintage, though deficient in quantity, is excellent in quality.

— ILLUSTRATIONS OF BRITISH FUNGI.—Dr. COOKE'S useful series of coloured illustrations, published by WILLIAMS & NORGATE, has now reached its forty-fourth number and its 700th plate.

— SEED DRILLS.—There is to be an international competition of sowing-machines (not sewing machines) at Foggia, Italy, during the present month.

— A BENEVOLENT SHOW.—The display of Chrysanthemums at Devonhurst, Chiswick, has been opened to the public for the benefit of a district ragged school. This example, set by E. H. WATTS, Esq., is one that is worthy of imitation. There are many establishments in all parts of the country which could be advantageously used for similar purposes.

— PLANTING FRUIT TREES IN TOWNS.—Belgian papers inform us that the authorities of the town of Ypres have planted fruit trees along the promenades. In this way about 600 Walnut trees have

been planted along the boulevards. The trees have prospered, and not only afford grateful shade, but produce a revenue which, in the present year, has amounted to 900 francs. The good burghers of Vpres can afford to let the boys indulge their natural proclivities.
